"In order to get a proper viewpoint upon this subject it is necessary to go back about a year—or just before last season's work began. At that time the western front was bulging farther and farther west. Village after village and town after town were being evacuated and the inhabitants made their way through the lines of the Allies in a destitute and starving condition. In our own country large bodies of men were being called from the factories and the farms and placed in concentration camps. Upon the seas we were losing ships almost daily, which were usually loaded with full cargoes of either food or war supplies. About this time the president issued a call to the farmers throughout the country to increase production to the utmost. This call seemed so timely and its need so apparent to all, that it was echoed right on down the line, through the department of agriculture, through the state universities, the press and by the four minute men.

"The farmers responded nobly to the call and produced a bumper crop of almost every staple. Some were stimulated with a hope of profit and some worked for sweet pity's sake. But all hoped for and expected a good price for their product, and most of them were willing to put an additional hundred cents into their crop if there was a bare chance of producing a dollar's worth more of the product.

"During our bean harvest conditions were very distressing. While there was a large number of the men who entered nobly into the spirit of the situation and tried to do their best, still there were sufficient whose sole aim seemed to be to draw big pay and then tie up every operation upon which they were employed, and thus made the situation not only very acute but at times almost heart breaking.

"When the threshing was finally over it was the almost universal belief that Limas would be worth about 12 cents. The farmers probably would have got that for them if they had only all pooled their beans and then had a litle patience while they moved off slowly. But, instead, our large and expensive crop has become a sort of football among some unscruplous brokers and has been kicked from pillar to post, until the price has been battered down not only to half what the producers expected, but in many instances to less than the actual cost of production. But this is not all. While the price has been steadily declining there has never been a sale for any large quantity of beans at any time or at any price. The consequence is that, when this year's assessment goes into effect it will find a large quantity of beans still in the hands of the unfortunate growers who are holding them against their will and at the same time carrying a heavy burden caused by the high costs of production and investments in Liberty Bonds and war donations, which were made with the belief that the beans would bring a good price and find a ready market.

"Under these conditions I think that the good offices of the farm bureau should be used in an endeavor to get the assessment on these beans placed at the lowest point possible, which is consistent with good judgment and the exigencies of the situation."

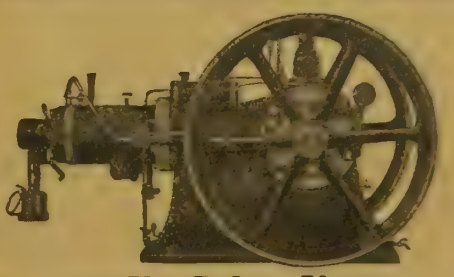
Top Dressing Talks

WHEN you buy a ton of ARCADIAN Sulphate of Ammonia you buy *more* nitrogen—*more* pounds of active, available, lasting plant food than you can buy in a ton of any other nitrogenous fertilizer.

This means that each pound of plant food in ARCADIAN Sulphate of Ammonia receives the lowest charge for cost of production, transportation, handling, storing and distribution on the farm.

Arcadian Sulphate of Ammonia

ARCADIAN Sulphate of Ammonia is the well-known standard article that has done you good service in your mixed fertilizers for years past. Especially kiln-dried and ground to make it fine and dry. Ammonia 25¼ per cent. Made in U.S.A.



The Great American Ammoniate

Plant 20 Acres A Day

Hitch your seeder to a Lauson Full Jewel Tractor and plant 20 acres a day, every day until your crop is in. Rides easily over fresh plowed soil without packing it because the weight is evenly distributed.

With the Lauson you can plant better, faster and at lower cost than you can do it in any other way. It speeds up farm production all along the line, being the ideal farm power unit for work either at the draw bar or belt pulley.

The LAUSON 15-25

DUST PROOF-ALL GEARS ENCLOSED

Study Lauson construction—you will convince yourself it is the best—all gears enclosed, running in a bath of oil. 24 Hyatt and Timken roller and ball bearings reduce friction. Sturdy four cylinder valve-in-head engine with 2⅜ inch crank shaft and heavy four bolt connecting rod bearings. Enclosed dust proof governor mounted on ball bearings and running in oil. Spacious operator's platform. Efficient transmission with hardened chrome nickle steel gears and shafts mounted on roller bearings. The more you learn about the Lauson, the more you will be convinced it is the tractor to own.

Have you seen the Lauson work? If not, get in touch with the nearest Lauson Sales and Service Station. They will be only too glad to demonstrate on your farm. You'll get a new idea of tractor farming economy and reliabilty. Sold with or without Christensen starter.

Write us for the address of the nearest dealer. You are sure to find him the leading dealer in your community. Get our free tractor book.

Seeks to Aid Wine Grape Growers

HOW to help growers of wine grapes to readjust their farming to meet new contions under national prohibition is a problem receiving the attention of the United States department of agriculture. Most of the growers in California, principally in the bay counties around San Francisco, where about 20,000 acres of wine grapes are grown, have depended wholly upon these vineyards for their support. The department sees a ray of hope in the complex situation through conversion of a small proportion of this acreage into "currant" grapes.

Raisin Production Not Practicable

Perhaps thought has turned, somewhat naturally, toward a conversion of the wine vineyards into raisin vineyards. This, the department experts think, would be folly. Climatic conditions in the wine vineyard districts are such that raisin grapes could not be cured. They ripen at a time when the fall rains are beginning, and, with rare exceptions, would represent practically a total loss. But even if the curing could be effected by artificial means, the matter of relative yields would make the raisin industry in the dry wine vineyard regions unprofitable. The yield of the raisin grape varieties there ordinarily does not exceed three to six tons to the acre. In the raisin vineyard districts yields range from six to 20 tons an acre. This difference would render it impossible for vineyardists in the former region to compete with those in the latter in raisin production.

Some hope is held out, however, for the successful conversion of some wine vineyards into currant vineyards. Currant grapes ripen very early and would be ready for curing in the dry wine districts before the fall rains begin. Their yield, under favorable conditions, is relatively high, running from four to eight tons to the acre.

There is an established market in the United States for about 30,000,000 pounds of dried currants annually, department specialists say. That was the average quantity annually imported prior to the beginning of the European war. The demand for them has become thoroughly fixed and may be fairly depended upon. From 8000 to 10,000 acres of grapes would be necessary to meet this demand, heretofore supplied from abroad. Domestic consumption of currants, no doubt, could be greatly increased by proper educational efforts, thus affording a larger possibility for the conversion of wine vineyards.

This conversion could be accomplished and would pay only where the vines are phylloxera resistant, comparatively young and have not previously been grafted.

Experiments With Currant Grapes

For about 15 years the department of agriculture has been experimenting with currant grapes in California.

Two cardinal points must be observed in order to grow the choicer currant grapes successfully. They should be grafted on phylloxera resistant stocks congenial to them, but such stocks must also be suited to the soil and other conditions. In an extensive test on various resistant stocks, a sufficient number of varieties of these stocks has been found from which to select such as are adapted to the various soil types and other conditions and that are congenial to currant grapes.

The other essential is that the vines be thoroughly girdled at blooming time. It has been definitely ascertained that this is necessary to make the blooms set and to secure a full crop of fruit. This girdling consists in making two parallel cuts entirely around either the trunks, arms, or canes of the vines and taking out the bark between the cuts. The girdling must be thoroughly done and it must be done while the vines are in bloom.

Grape Syrups Another Possibility

There may be possibilities for the wine vineyardists in the making of grape syrups. As the University of California has pointed out, the manufacture of syrups could be accomplished with comparatively little expense for special equipment, as some of the wineries already have syrup making machinery, and much of the equipment used in wine making is also used in syrup making.

A table syrup produced from grapes necessarily would be a high priced syrup. It could not compete with the commoner kinds of syrup in price and the establishment of special markets for it among discriminating consumers would be necessary. Something has already been attempted in the way of manufacturing preserving syrups from grapes. This might offer rather a large outlet, were it not for the fact that canners thus far decline to use such syrups and prefer paying more for the sugar syrups they have used, as they feel that their canned products if sweetened with grape syrup might be discriminated against by consumers who are accustomed to canned fruit sweetened with sugar.

San Joaquin Valley Cover Crops

Relating his experience as to cover crops in the San Joaquin Valley J. D. Fryer of Kingsburg writes in the Sun-Maid Herald:

In 1914, about the middle of February, I sowed 14 pounds of alfalfa seed per acre on land that was very lean from producing fruit for perhaps 12 to 15 years without any fertilizer. The ground was well prepared by plowing deep and following by a thorough harrowing and clod smashing to make the seed bed compact to insure an even stand. When a foot high the alfalfa was clipped about June 1 and given a good watering. About August 1, I cut a fair crop of hay, and September 20 another, watering the land well after each cutting.

Then about November 15, after another good soaking, I plowed the land, turning under a hay crop, using a chain and an iron weight to cover it completely. As a result this soil is almost like new, easy to work and will not pack. So I believe the above treatment is of great benefit to exhausted land.

Tries Bitter Clover

About September 15, 1915, I sowed eight pounds of melilotus indica, or bitter clover, per acre on another tract, and plowed it under in March, 1916. This also made a good, heavy cover crop and was of great benefit to the soil, causing it to plow easily for at least two or three years.

I sowed about 50 pounds of rye per acre on a two-acre tract for winter feed in September, 1918. I used the feed for my team and the cow, and planned to turn under a good cover crop this month.

Something Each Winter

I sold this place to C. W. Anderson. I will not have an opportunity personally to complete this test of rye as a cover crop, but I will say that I will never again let a season pass without having a cover crop. The $5.00 I invested in the rye seed has already paid 10 per cent interest on an investment of $2400. Put in another way, it has paid me $20 a month in saving of hay through the winter. The rye is now about 30 inches high. I mow and feed it noon and night, making a saving of two-thirds on hay, which I calculate would cost me $20 a month if I had not the cover crop. There will be a cover crop three feet high to turn under the last of March.

Favors Alfalfa

Summing up these experiences, I believe alfalfa is no doubt the best. But it will not grow winter feed. Yet it deposits much nitrogen and its roots go deep and penetrate and loosen the subsoil. The melilotus indica or bitter clover is a real good one purpose cover crop, but is of no use for feed. The rye, I believe, has much merit as a winter grower, furnishing a vast amount of good rich green feed for stock during the cool weather. It will no doubt produce 100 per cent more than winter barley.

I would suggest where it is possible to sow alfalfa first and then skip two or three years then follow with rye. I believe our land with cover crops

will hold its fertility indefinitely and produce double the fruit that it will without the cover crop.

FRUIT GROWERS MAY MEET AT CHICO

It will soon be time for announcement of the 51st fruit growers' convention which would have been held in Riverside last fall had it not been for the flu quarantine prevailing all over the country. It was postponed until some time during the spring or early summer. Announcement has not yet been made but the people up in Butte County have determined to have the first convention, after the Riverside convention, held in Chico. The state commissioner's office has been approached regarding the matter and reports:

So emphatically are the people of Butte County supporting this movement to bring the convention to Chico that the board of supervisors has already set aside $500 for advertising, hall rent and other expenses connected with the convention. A similar sum is pledged by the Chico chamber of commerce to provide for the service of a reporter and issuing the report, thus making $1000 to insure the success of the convention.

Should the Chico convention become a reality, Mr. Durkee points out that Butte County has many interesting features to show visiting farmers and fruit growers. The orange and olive orchards in the vicinity of Oroville, the state land colony at Durham and the United States Plant Introduction Gardens are only three of the many attractive trips already being planned.

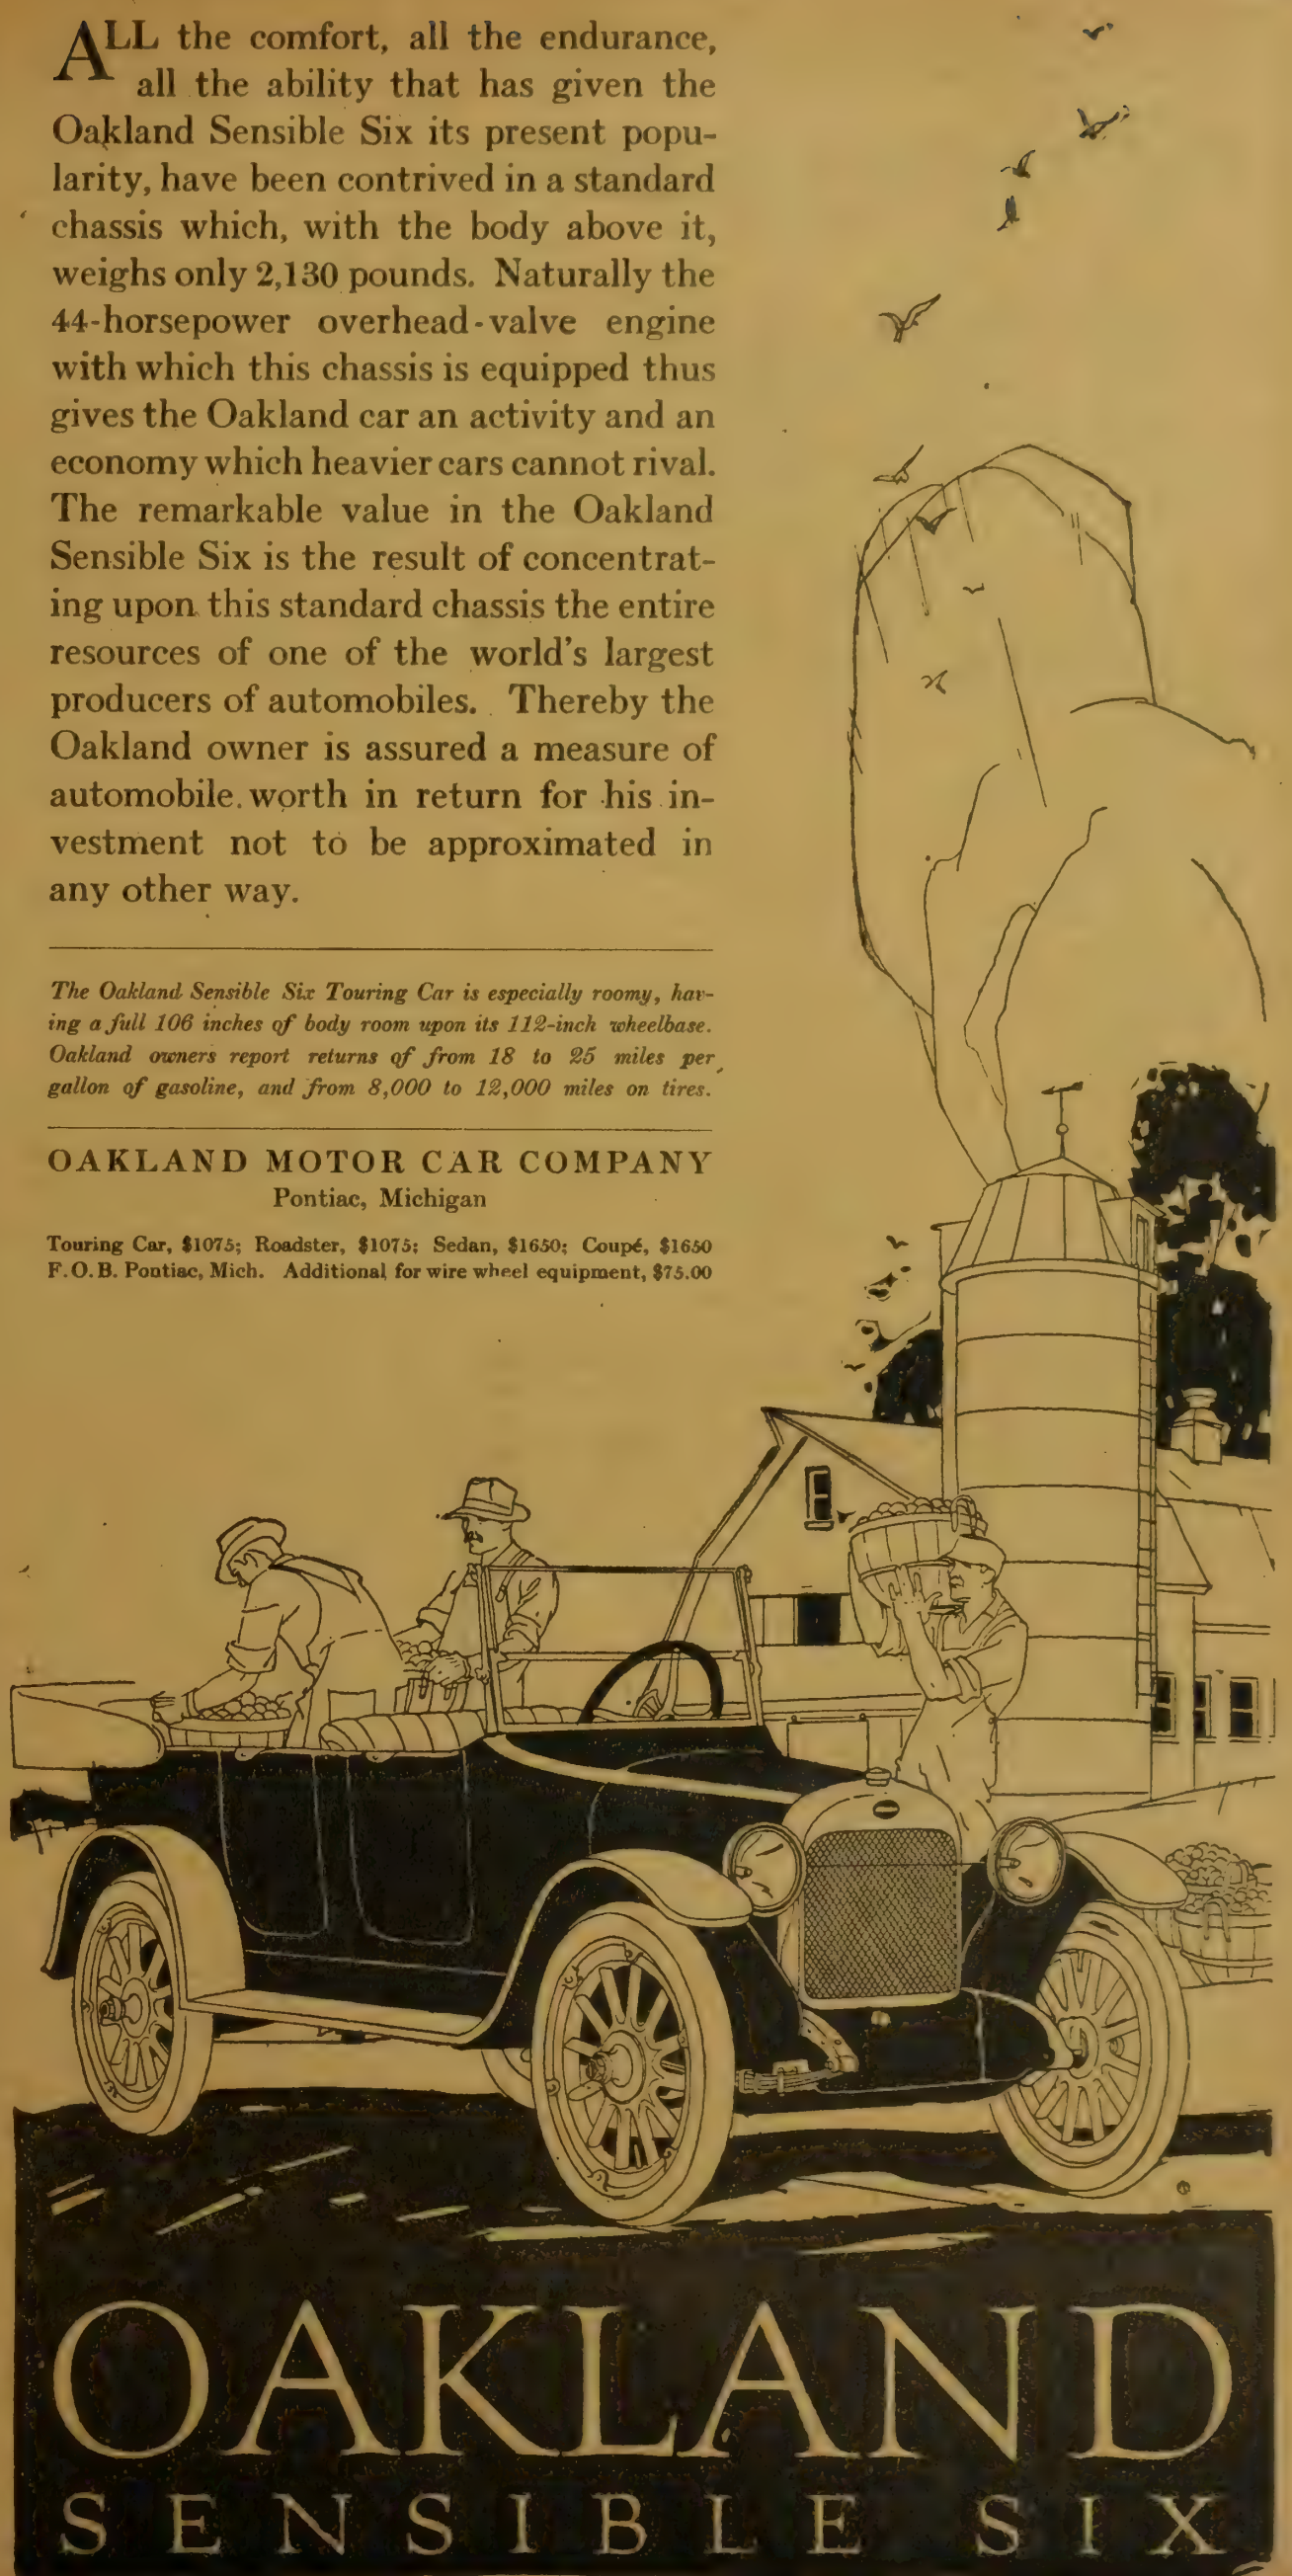
CODLING MOTH ATTACKING WALNUTS

Since the announcement that the walnut worm has been identified as the codling moth, Laspeyresia (Carpocapsa) pomonella Linn, there has been some discussion as to the effect this determination might have on proposed control measures planned for the coming season. The state commissioner of horticulture desires to allay any doubts on this matter which may exist in the minds of those interested in the walnut industry.

Regardless of the identity of the insect in question, the fact that it is capable of doing serious injury to the walnut crop cannot be disputed. The codling moth has attained the status of a real pest when attacking walnuts as well as apples and pears. Professor Ralph E. Smith of the University of California, who has been studying the work of this insect during the past season, writes as follows: "I want to go on record as believing that this is the worst pest which has struck the walnuts thus far, and that its spread into new territory can be and ought to be hindered by every possible means along the lines already commenced this season."

The codling moth can undoubtedly be checked more or less by proper precautions in the handling of the walnut crop and by thorough disinfection of used walnut sacks before returning them from the packing houses to the groves. The traffic in culls must be closely watched and all sacks used as containers for cull walnuts should be disinfected before they are returned to the groves.

Assembly Bill No. 645 by Assemblyman H. A. Miller seeks an appropriation of $10,000 for the purpose of determining and applying control measures to combat the spread of the codling moth. If this bill passes, the state commissioner of horticulture will at once call a meeting with the walnut growers and with representatives of the University of California to determine upon a plan of action in order that the greatest possible benefits may be received by the industry concerned. There is acute need for this money in carrying on the fight against this insect during the next two years. Now that the identity of the insect has been definitely established, it should not be considered that the fight has been won but this information should be used merely for the more intelligent prosecution of the best known methods of control.



Memorial trees for soldiers from that community who have died in service were recently planted in the Roosevelt school district in the Salt River Valley.

ALL the comfort, all the endurance, all the ability that has given the Oakland Sensible Six its present popularity, have been contrived in a standard chassis which, with the body above it, weighs only 2,130 pounds. Naturally the 44-horsepower overhead-valve engine with which this chassis is equipped thus gives the Oakland car an activity and an economy which heavier cars cannot rival. The remarkable value in the Oakland Sensible Six is the result of concentrating upon this standard chassis the entire resources of one of the world's largest producers of automobiles. Thereby the Oakland owner is assured a measure of automobile worth in return for his investment not to be approximated in any other way.

The Oakland Sensible Six Touring Car is especially roomy, having a full 106 inches of body room upon its 112-inch wheelbase. Oakland owners report returns of from 18 to 25 miles per gallon of gasoline, and from 8,000 to 12,000 miles on tires.

OAKLAND MOTOR CAR COMPANY

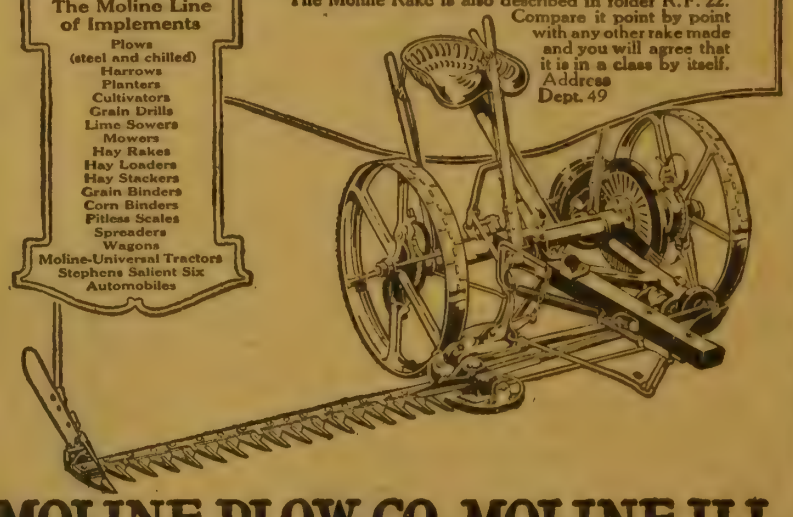
Moline Mower

"I have about two acres of soggy land. The sweet clover on this land was as high as the horses, and with the old stalks from last year still on the land. The Moline Mower is the only mower that I was able to cut this clover with, and I have tried them all. I consider the Moline Mower the best that is built. The mower is the lightest draft machine I ever hitched a team to, and certainly do recommend the Moline Mower to any one considering the purchase of a mower."—*A. C. Maneman, Payette, Idaho.*

This letter shows what service you can expect from a Moline Mower. The Moline gives such satisfaction wherever used and will give you better service than you ever obtained from a mower before.



It will cut any kind of grass; it is unusually light in draft, and it will give you from 25 to 40 years of satisfactory service—many Moline Mowers have been used longer than this.

And remember, the Moline Mower is not a new mower, but has been in use in all parts of the world for the last 60 years.

Space does not permit us to tell you all about the good points of the Moline Mower. Send for Folder R. F. 22, which we will gladly send you, and you will readily see why the Moline Mower gives such splendid satisfaction, year after year, cutting all kinds of grass.

The Moline Rake is also described in folder R.F. 22. Compare it point by point with any other rake made and you will agree that it is in a class by itself. Address Dept. 49

Questions and Answers

ANSWERS BY EDITOR AND STAFF

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Need Bone-Making Material.

Would like to learn through your columns the exact appearance and condition of the bones of a healthy chicken. Our small flock seem to be in perfect health and lay well, but the bones of every chicken we kill seem to be filled with a dark red colored marrow, and the outside shell of the bone seems very thin. Sometimes you can crush the bone with your fingers. The legs of the fowls seem to be most affected, but all the bones show the trouble. We are eating the chickens and they taste all right. Do you think we should eat the fowls? Would like to have your diagnosis of the case.—E. A. Watson, Santa Ana.

Your chickens are suffering for lack of bonemaking material in their ration. Perhaps there is less lime in the water in your locality than in others, and so your chickens need an extra amount in the ration. Oyster shell and grit should be before them at all times, and they should also have coarse bone meal in the dry mash. Make it about 10 per cent of the whole mash and let them have free access to it. This soft condition of the bones is not a disease and does not affect the birds' fitness for food at all.—J. A. K.

Baled Sudan

Is there any demand for Sudan hay in the open market? Can it be baled and what is it worth per ton?—Subscriber, San Luis Obispo County.

In the Los Angeles market it has been handled baled but there seems to be none in the market at the present time. Dealers are rather cautious in handling it unless it be on a consignment basis. Anyone having stock should get in touch with the large wholesale dealers before making shipment. From such a condition of market it is impossible to state with any definiteness as to cost, but it probably would not exceed $16 or $17 f. o. b. cars Los Angeles, or San Francisco.

Dark Yolk

We have some hens that lay eggs with a dark yolk. Will the eggs be good to use?—Subscriber.

The color of the yolk depends upon the character and amount of green feed. A pale yolk indicates lack of greens. Alfalfa gives a rich yellow color to the yolk, and other greens a still deeper color. As I do not know what your hens have been eating I cannot say just what has made the yolk so dark, but whatever it is, it has done no harm.—J. A. K.

What Breed of Duck?

I bought from a dealer six ducks and a drake. He claimed they were Indian Runner ducks; others have called them Mallard. I questioned him at time of purchase for I have never heard of any Indian Runners excepting white and fawn. The ducks are brown with a little touch of white and blue on edge of wings and three have a slight indication of a white ring round their necks. They weigh about four and a half pounds each and are laying heavily. For 16 days now they have laid six eggs each day, which is 100 per cent. They lay a large greenish colored egg. The drake is a dark slate in color tinted with brown with a green head. Will you kindly advise me through the columns of your paper what breed they are?

From the description given your ducks would seem to be a cross of Mallard on Fawn and White Runners. The Runners have absolutely no color except fawn and white. The Mallard drake has a green head with white collar, the back of the neck and the breast dark chestnut, rump black, wing spot greenish purple fringed with white, and the under surface grayish white. The four central upper tail coverts are black and curly. The female is brown and buff, with a green wing spot. Your birds are probably from a cross of Mallard male on Runner female.—J. A. K.

Planting in the Moon

Is there any advantage in planting tuber crops in the dark of the moon and top crops in light of the moon? Is there any advantage in plowing or grubbing in August when the moon is in a certain position?—Subscriber, Long Beach.

We presume nine-tenths of our farmers today have no faith whatever in planting in the various phases of the moon. However, the question is discussed in an article in the Cultivator of March 1, page 314. The time was when the setting of posts, laying of fences and planting of nearly all crops were influenced largely by the moon's phases.

Tuber Moth in Seed Potatoes

Is there danger of spreading tuber moth by planting seed which is infested? Should it be treated with or dipped in any solution?—Subscriber.

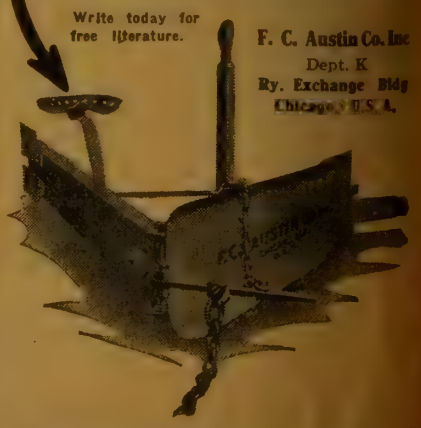
So far as spreading tuber moth is concerned, there would probably be no danger in planting infested seed. In all probability the seed would give very low percentage of thrifty plants because of the havoc wrought by the worm in the potato. A dip would not be effective so far as treating the moth in the potato is concerned. Potatoes are dipped, however, to prevent scab and to destroy fungus spores. The solution commonly used is 40 per cent formaldehyde, one pint to 40 gallons of water.

Hens Eating Beans

The diversity of appetite in our hens must be most pronounced, for some hens will not touch beans while others will take them readily. Blackeyes seem to be their favorites. A subscriber, Mr. Jacques of Fontana, calls attention to the fact that his hens have been fed beans to the extent of 40 per cent of their hard grain ration, and they prefer the beans to barley, milo or kafir and even yellow corn. In feeding he has noticed that some of the hens even prefer the beans to the wheat which is now fed to a very limited extent, and with this feed he is getting a 65 per cent laying efficiency. The beans are fed whole.

Ditching-Draining Grading

Farmers who want to make money and save labor write for our illustrated folder on Austin Farm Ditcher.



THE AUSTIN

Costs Little **Does Much**

Cuts V-shaped ditch to depth of 4 feet, grades roads, builds terraces or levees. Reversible blade—of all steel construction—the supreme tool for digging draining ditches. Made by firm 40 years the leaders in earth working machinery.

Four sound horses cost as much as a Maxwell Truck

AND the Maxwell will outwork three good teams. It feeds as it runs. Puts in a net day's work and piles up no expense. It will carry and fetch a thousand miles for a thousand hours at a stretch. No wagon can keep up with it—weather can't hold it indoors. Never founders or flounders and never has a "Blue Monday" or glanders. No animal or machine its equal for willing and competent service.

Does more work, more sorts of work, more hard work, more often under more unfavorable conditions than any carrier. Designed for the heaviest hauling and the hardest mauling.

The Maxwell goes farther and faster than the biggest truck and travels where they can't. 2400 pounds. Only one farmer in ten ever needs a heavier machine and at that only one time in ten. Farmers the land over are operating Maxwells because it answers every average purpose and costs least to own and least to operate.

The same type of worm drive which $5000 trucks advertise as their great feature. $5000 truck construction and sold with a $5000 truck guarantee. 10-foot loading space. Electric lights and generator. Chassis $1085 f.o.b. Detroit.

Pays its way from day to day.

MAXWELL MOTOR COMPANY, Inc. - Detroit, Mich.

Tractor Points Often Ignored

By J. B. Neff.

OVERENTHUSIASTIC salesmen will often tell the farmer that he can spend almost all his time in the field running the tractor at profitable work. Statements that one hour a day is all that is required to keep a tractor in good working order are frequently made. Such statements almost invariably result in dissatisfied customers who might have been contented if the facts had been presented and they had been informed that the tractor which was to replace and do the work of three to six horses would require no more time for care and cleaning than the horses would during the working days of the tractor, if economical results as to amount of work done and durability of the tractor were considered.

Oil Thoroughly

Oiling the tractor is one item which takes more time than many operators are willing to give but which must be done if success is to be secured. The principal oiling should be done after the day's work is finished and while the machine is warm. Bearings using cup grease should have the cups removed and the bearings filled with a good grease gun which has been fitted with pipe which can be screwed in and temporarily take the place of the cup. In this way grease can be forced into the bearings until it shows at each end. This pushes out any grit that may be finding its way into the bearings and insures grease on all the wearing parts. The cups should then be filled and screwed in place for use the next day, the transmission gears and crank case examined and replenished with the necessary oils, and the gasoline or distillate tank filled.

When this is finished it will be found that the hour has passed and most likely the half of another hour has gone with it. The grease cups should be turned up a few rounds after running two hours and those places having heavy work should have the cups refilled at noon. The stops for oiling and an occasional look at the water in the radiator will take at least another hour of the day. There will also be some adjustments and the amount of repairs will depend on the care given the machine and the workmanship and material placed there by the manufacturers.

Only the best oils and greases should be used in any place. The transmission grease should be such that will stick to the gears even when hot, and the lubricating oil used in the crank case should retain its "body," that is, it must stand a high degree of heat and not get so thin as to be useless as a lubricant, while it must be light enough to go through the oil pump when cold. The oil must be kept clean in the crank case. Poor quality oil may have to be renewed every 30 to 50 hours, while good oil could be used 100 hours without danger.

Rating

The rating of power of tractors is often misleading since the rating is sometimes given on the best performance and under conditions not always found in the field. Then, too, the tendency of the user is to overload almost invariably. Too high rating of power and too much load make a bad combination. This comes largely because the tractor users do not quite understand the resistance of the soil to the implements used nor the resistance of the soil to the wheels or track of the tractors. The resistance of medium or sandy sediment soil to the plow will be about three pounds per square inch of cross section of the furrow. If the plows are set to cut six inches deep each 12-inch plow will move a cross section of 72 inches and have a resistance of 216 pounds to overcome.

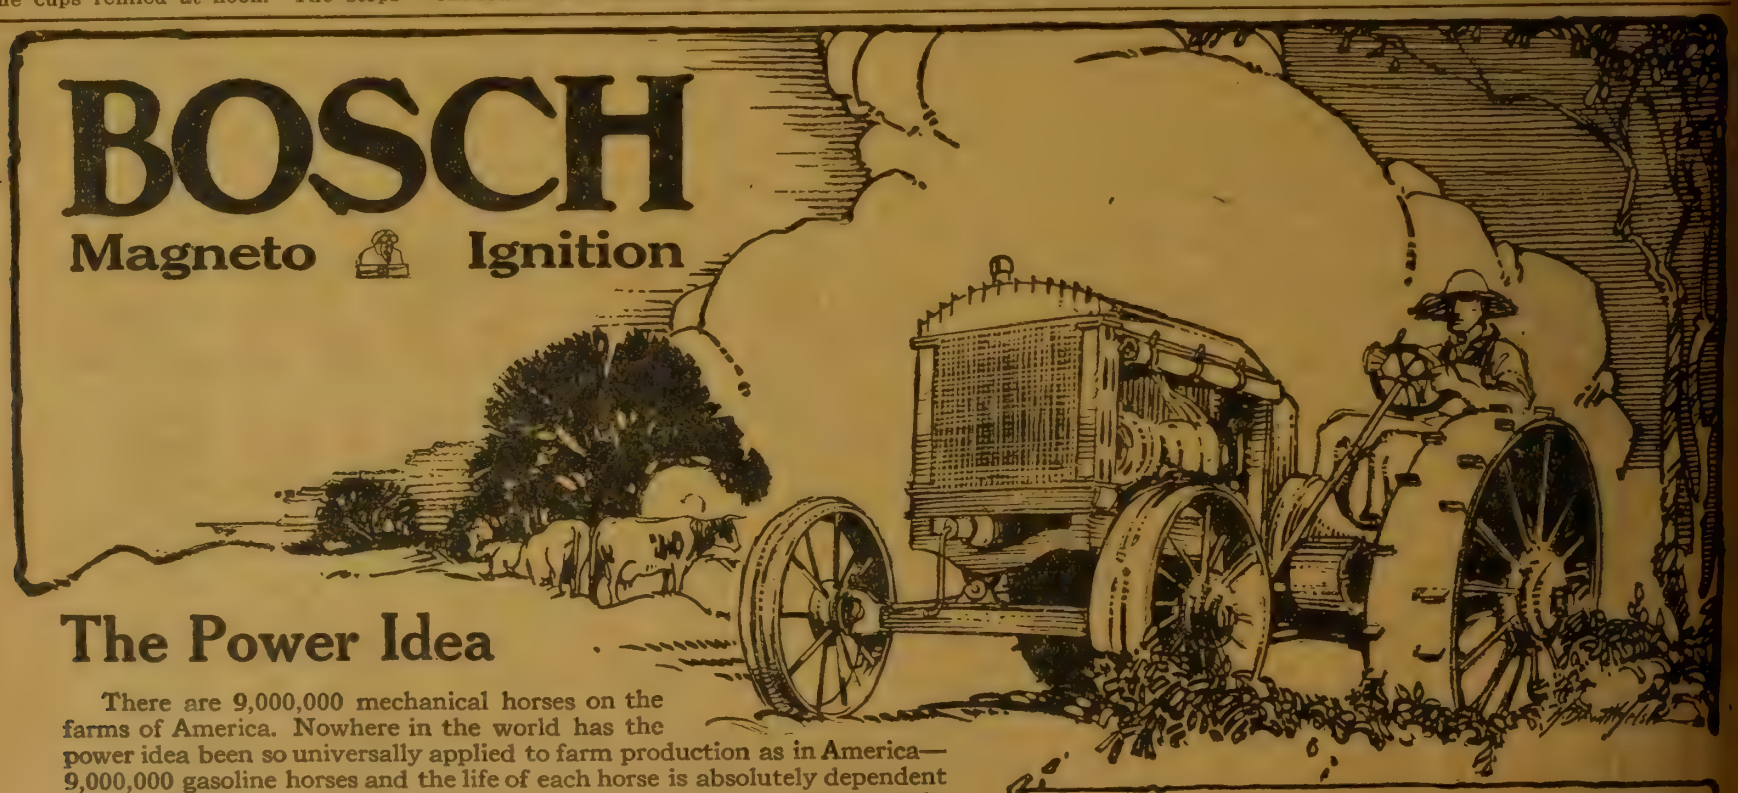
Tractors will not sink so much on heavy soil, and consequently can deliver more power to the plows on clay land than on sandy land, so the tractor will frequently draw the plows equally well on the heavier soil.

Worth Remembering

It will take one actual horse power to haul a load having a resistance of 150 pounds at a rate of two and one-half miles per hour, but in field work a horse will be very tired if he overcomes a resistance of 125 pounds and walks two miles per hour all day. From this we see that a 12-inch plow running seven inches deep in medium soil is all the load two horses should be expected to pull. A team can be depended upon to exert reserve strength for a few minutes to move two or three times as much as they can in an all-day pull, but when a tractor is so badly overloaded it must be run at a very high speed, which is destructive of the tractor engine, otherwise it will slow down and stop. The effect of grade is often such as to overload a tractor and a rise of two feet in 100 feet in soft ground may increase the load 20 per cent. and be an overload.

Crisis in the Potash Industry

THE United States geological survey manifests concern as to the American potash industry. Prior to the war the country used more than a million tons of the crude potash. Much of this was from Germany and the supply was practically all cut off at the beginning of the war. Production has been increased in this country until it has reached practically one-fourth of the former importation. Under the encouragement of special high prices the warehouses have been filled and yet it suddenly appears that there is no sale for the product for which it was thought the country would suffer if not supplied. No satisfactory explanation of this situation seems to be offered.



In a statement issued by the geological survey there is a good deal of discussion about present sources and production of potash and apparently some confusion in the use of the terms by which this production is expressed. The following is therefore a brief summary of the situation based on the latest available data. The statistics for the year 1918 are not yet complete, referring to the miscellaneous materials carrying potassium which are used or valued chiefly for the potassium contained in them. In 1913, the last year before the war, there was imported into the United States 1,092,588 short tons (gross weight) of the miscellaneous potash-bearing materials; equivalent to 270,720 short tons of "pure" or "actual" potash.

Our greatest source of American-produced potash is Nebraska alkali lakes from which brine is obtained. These deposits are now reported to be producing at the rate of 600 tons (gross weight) of potash salts a day, which is 219,000 tons a year, equivalent to approximately 50,000 tons of "actual" potash. This district produced 43,219 tons (gross weight) of potash salts, equivalent to 10,232 tons of "actual" potash, in the first six months of 1918, these being the latest statistics of production now available.

Searles Lake, in California, is a large deposit of mixed salts containing a somewhat complex brine that is unusually rich in potash. Estimates of the amount of recoverable potash in this deposit indicate that it contains enough to supply the entire needs of the country for at least 80 years. This deposit is now yielding a substantial part of the country's supply of potash from lands that were but recently unutilized public lands. The deposit has now been subdivided by the secretary of the interior into a number of leaseholds, under authority of the potash leasing law enacted October 2, 1917, and a much larger production may be expected. At present this deposit is yielding about 4000 tons (gross weight) of potash salts monthly, equivalent to about 2000 tons of "actual" potash.

Other sources, such as distillery wastes, alunite, kelp and certain silicate rocks, are referred to as all affording limited supply. The potash recovered as a by-product from the dusts of cement and blast furnaces bears great promise for future production that may be maintained in the

BOSCH
Magneto Ignition

The Power Idea

There are 9,000,000 mechanical horses on the farms of America. Nowhere in the world has the power idea been so universally applied to farm production as in America—9,000,000 gasoline horses and the life of each horse is absolutely dependent upon ignition. The only ignition that can be truly reliable under the searching strain of farm work is magneto ignition, and magneto ignition means

BOSCH IGNITION

You will find the tractors, trucks, stationary engines, lighting systems, in fact all forms of gasoline motors with the best reputations, are invariably Bosch-equipped.

Bosch Ignition on a list of specifications means that the manufacturer of that piece of machinery has spent more money in order to make a better and more enduringly perfect product. He is protecting your interests. That's the kind of a machine you want. Insist on Bosch Ignition—you can get it.

Stop in at the nearest Bosch Service Station or talk to the nearest Bosch Dealer. Ask him how and why Bosch is superior. He will give you a convincing demonstration. Get prices on having your farm machinery Bosch-equipped. It will save money in a year's service.

face of competition. It appears that a quantity of potash equivalent to nearly one-third of our normal annual requirements is now going to waste in cement furnace dusts. The quantity lost in blast furnaces seems even greater, but we are probably not yet in a position to say what part of this is practically recoverable. The cement dust collected in the first six months of 1918 amounted to 5909 tons carrying 658 tons of "actual" potash, which was less than three per cent of the total domestic production. The recovery from cement dust increased during the latter part of 1918.

But unless the large stored supplies already on hand find more ready disposal there will be little encouragement to increase the industry. Fortunately potash is not a long question to Californians on California soils.

CORN BORER QUARANTINE WITHHELD

A hearing to determine what is to be done with regard to quarantine of the territory in Massachusetts and New York infested by the European corn borer was held at the offices of the federal horticultural board, United States department of agriculture, February 26. It was previously determined that the insect may infest in addition to corn many herbaceous plants, including such garden or flowering plants as celery, Swiss chard, green or string beans, beet tops, turnip tops, spinach, dahlias, gladioli, and chrysanthemums. A great many truck growers and others who would be affected by the proposed quarantine against interstate shipment of such plants appeared at the hearing.

The state governments of Massachusetts and New York, it was brought out at the hearing, are anxious to do everything possible to eradicate or control the pest. State authorities are now making preparations for handling the situation by state quarantine and otherwise, including the passage of additional legislation deemed necessary. The department of agriculture has already established a provisional quarantine with respect to this corn borer in Massachusetts. Additional federal quarantine action will depend on the extent of cooperation, if any, needed to supplement quarantine and other control operations conducted under state authority. The areas infested, both in Massachusetts and New York, are entirely within the state boundaries, and the efficient control promised by the states may eliminate the necessity for further federal control of interstate traffic.

FARMERS WORK TOGETHER IN THRASHING AND SILO FILLING

At a county meeting of the farm bureau of Trumbull County, Ohio, to secure cooperation of thrasher men in special grain and labor-saving practices, a compromise price for thrashing service was agreed upon between the thrasher men and the farmers. It was understood that farmers wherever possible would organize thrashing rings. To accomplish this, meetings were held in 13 townships, and those present divided the township into convenient districts of 10 to 14 farmers. For each of these a chairman was selected to call together the men of his district and perfect plans for the encouragement of thrashing outfits and exchange of service.

Delay in thrashing and silo filling and consequent waste and disadvantage, with increasing shortage of available thrashing outfits, had convinced them of the necesity of such measures, and 42 thrashing rings were formed.

KNEW HIS FRIENDS

"Yes, sir," boasted the hotel proprietor, "that dog's the best rat catchin' dog in the state."

Even as he spoke two big rats scurried across the office floor. The dog merely wrinkled his nose.

"Rat dog!" scoffed the traveling man. "Look at that, will you?"

"Huh!" snorted the landlord. "He knows them. But just you let a strange rat come in here once!"—Life.

There's a limit to every man's capability—but few men reach their limit. —De Laval.

They Win On The Roads You Ride On

DIRT track champions of America—that's the title Ajax Tires have won for two years in succession.

Think what these Ajax dirt track victories mean to you. Dirt tracks are merely country roads with a fence around them—the very same going you encounter when you drive your car.

In 1918, Ajax Tires shattered 9 world's records and smashed 49 track records, at country fairs in all parts of the United States.

Tires which stand dirt track racing best, are best for service over your own dirt roads.

Ajax Shoulders of Strength

The big reason why leading dirt track racers insist on Ajax Tires is that strong supporting shoulder of rubber which braces each side of the tread at its base. It re-inforces—gives more strength where strength is needed.

AJAX ROAD KING

Note the massive tread of the Ajax Road King. See the triangle barbs. They hold the road in a firm, friendly grip. Put Road Kings on your car and forget your tire worries.

Ajax Tires Are Guaranteed In Writing 5000 Miles

How and Why I Entered the Hereford Business

By John A. Bunting

THERE were two reasons, the first being my own experience with cattle in California; the second, my observations in Wyoming.

In running my herd of grade cattle I had been using Hereford bulls as well as another breed. Believing it was necessary to get the best results I thought I must interchange the breeds, but since it has been proven to me that this was a foolish idea. If bulls of the right kind are used this interchanging is unnecessary.

During the years of 1912 to 1916 I spent a good deal of my time in Wyoming in the Big Piney country. That section is about 60 miles south of the Yellowstone Park and about 90 miles from any railroad and is strictly a cattle country.

I have watched the range cattle come southward in the fall from the North, most of the cows having large calves at their sides. These cows were almost always in medium flesh, but some of the cows were very weak and thin. The calves were weaned as soon as all the cows were in and the thin and weak cows put in a good pasture where they were fed hay to help them along. While the herd showed about half white faces, only about ten per cent of the thin and weak cattle were white faces.

The Hereford bulls always came South in better condition than bulls of other breeds. In the range where I spent most of my time the Hereford bulls and bulls of another breed were about evenly divided, but almost always the following spring about 65 to 75 per cent of the calves had white faces. The cattlemen with few exceptions told me that the Herefords were by far the best cattle for Wyoming. My experience in California was about the same.

During one of our hard winters the cattle got thin and weak; the cattle being divided between Hereford and another breed. It was very common to find cattle down in the ravines or bog holes, and during this particular winter we pulled 16 head out and only four were white faces, the rest different breeding. Of the four whitefaces, as soon as we pulled them out, three got up and tried to hook, the fourth never got up. Of the remaining 12 it was a different story—only two getting up and pulling through the winter. This made me absolutely certain that for range cattle I would never buy anything but a Hereford bull, and I have stayed by my conclusions.

In 1915 the University of California was giving short courses in different lines of agriculture, and the course that attracted my attention was "Beef Cattle." I left to take up this course. After arriving at Davis and looking over their wonderful cattle, I soon saw where I was feeding too many of the wrong kind. They soon showed me where I could keep one good pure bred registered animal and make more money with greater pleasure than I could out of four range animals.

I soon became acquainted with Alex McDonald, Professors True, Royce and Miller, who were all very kind, and it seemed that each one of these men went out of his way to help me. I certainly appreciated their kindness more than they knew.

Herefords being my choice, I soon decided to take up registered Herefords as soon as possible. I even got a price on one heifer, but it seemed so high to me at the time that I did not buy anything. On coming home I took my horse and went out among my own range cattle. They never looked so bad to me as on that ride, although they were good range cattle. When I got back to the house I got my pencil and paper and began figuring. The result was I soon returned to the University Farm at Davis and bought this one heifer; my only fear being that she would not travel my hills, as so many people told me that registered animals that had been raised in small quarters would not stand the hills. The heifer was two years old. When I got her home all admitted she was a beautiful animal but were quite certain that she would die if I turned her in my hills. However, she was turned out in October with the rest of the cattle, and winter soon set in. The first week the heifer hung around the buildings, never going out of sight, and I began to believe my critics were right, but within a week she mixed with the rest of the cattle and it was then seldom that I saw her unless I hunted her up. On December 24 she dropped a heifer calf and both mother and calf ran together on the range.

At the end of this severe winter this registered heifer and her calf were in far better condition than any of the others, and she was the only cow that had her calf to support during the winter months; the other cows calved in March. This so thoroughly convinced me that I have been selling range cattle to buy registered animals of quality ever since.

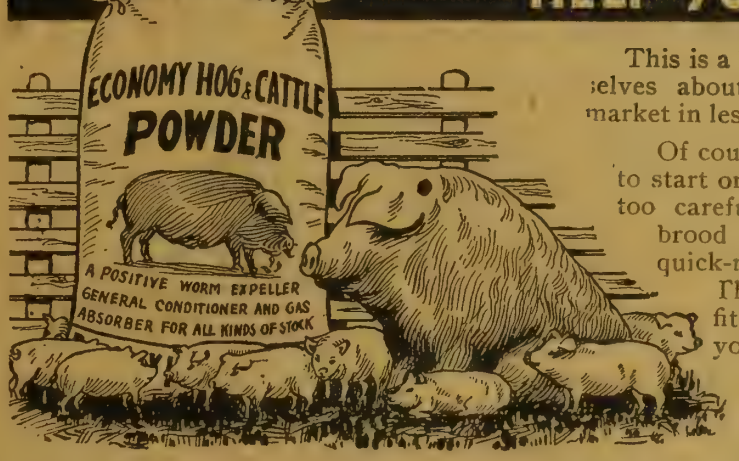
I have never had the money to go into registered cattle very fast, but I can say from the bottom of my heart that the University Farm at Davis, with the help and encouragement of the four men above mentioned, helped me into the most pleasant work I have ever had.

The registered animals have proved themselves in another way. I have a young bull out in the paddock that is only 18 months old and yet he tipped the scales at 1550 pounds. Had this bull been a steer he would have brought 14 cents a pound, making him worth for beef alone $217. A buyer last week offered me 14 cents for some grain and hay fed steers. When it is possible to get $217 for 18 months old steers it surely looks good to me.

The more I see and study Herefords the more wonderful they appear to me. My cows have not been under shelter this season, and most of them have calves at their side and they are in perfect breeding condition.

I have showed my cattle ever since I have owned them, with a good deal of success and pleasure.

If a person's ranch is suited for the raising of registered cattle of quality, I know of no more interesting business, affording a good profit, than the raising of quality registered Herefords. It is my intention to add to my herd from time to time and I expect to put in only the best females I can afford as I have found that buyers are always willing to pay good prices for the better kind.



As I remarked before, I have found pleasure and profit in my small herd and I look forward to the day when there will be many more herds of Herefords in California. There is a wide and certain demand for better bulls.

BEANS FOR FEED

J. F. Callahan finds that his hens eat Hale Blackeye beans readily, but that he fails to induce them to eat other varieties.

Your Little Pigs Well Started are Half Raised

LET ECONOMY STOCK POWDER HELP YOU

This is a boiled-down personal talk between ourselves about raising and sending more hogs to market in less time, in better shape, for more money.

Of course you ought to have good individuals to start on—the best you can buy. You can't be too careful in selecting your herd boars and brood sows if you're looking to breed to a quick-maturing, strong, easy-feeding type. Then, too, you should have everything fitted for the comfort of the animal. Give your brood sows good, warm sleeping quarters, with plenty of room to exercise. Take special pains with their feed. Give them only those foods that will supply the nutriments they need for themselves and for nourishing their young. Keep your hog houses thoroughly disinfected, well ventilated, light, dry and warm, and your hogs free from lice, scurf, mange, etc.

Brood sows, being naturally feverish, should be kept in good condition—their stomachs sweet, liver and kidneys regulated, their fever kept down to prevent constipation. See to it that your brood sows are in good condition before farrowing. Don't give your sows any feed whatever from 24 to 36 hours after the pigs are born. She has enough milk, and all that is necessary is plenty of warm water—nothing else. After that start her lightly on feed.

Give your young pigs plenty of exercise. Keep them warm. See that they get lots of sunlight and be sure to keep them dry the first two or three weeks. Watch your pigs and sort out the ones that are not doing well and put them in a pen by themselves. If they have a rough coat of hair, heavy paunch or belly, watery or gummy eyes, they are probably wormy.

Our Powder will keep your pigs in condition by acting on the liver, kidneys and blood. Keep the stomach sweet. Acts as a general cleaner of the system—expels the worms, aids digestion, purifies the blood, keeps the bowels loose and active, prevents scours, thumps and all other ailments.

What I Look For in a Herd Bull

By W. M. Carruthers

THE problem of selecting a herd bull—or any herd sire, for that matter—is a very vital one. Examples are not difficult to cite where the success or failure of many breeding establishments can be checked up to the character of sires used, and yet when one notices the rather indifferent manner in which many men go about selecting their bulls he is impressed with their utter disregard of some of the fundamental factors of herd improvement. It is my frank opinion that at least 80 per cent of the breeders of this country give little or no thought to those points which make a great sire. These men are usually governed by their pocketbook or by some fad or fancy. Of the other 20 per cent I would say that three-fourths of them do really give some thought and time to the problem in hand and are a bit more liberal in the matter of price. The remaining five per cent constitute the constructive breeders. They are the men who are in the game for the love of the business and who, because of their enthusiasm, have studied the science of breeding from every angle. They know pedigrees as well as individuality and they have familiarized themselves with the most successful blood lines and the methods used by other successful breeders. This five per cent does not include owners who depend entirely on their managers for advice, but does include many men who have reached the top after an apprenticeship with the feed bucket. These men are the constructive breeders and the work they are engaged in, that of improving animal efficiency and form, is as noble and dignified as any profession.

Speaking from a beef standpoint, it is difficult for me to properly express all my ideas regarding the selection of a herd sire with the expectation that all would agree. It has been my observation, covering a period of over a quarter century, that, even among successful breeders, there is apt to be a difference of opinion. However, I believe that the majority do recognize the more essential fundamentals and are generally agreed as to what these essentials are.

The real breeder, as the years go by, develops in his own mind an ideal form. This ideal is the result of careful observation and study and with the ripeness of age the real herd bull, conceived in his imagination, comes nearer a fact. The real breeder is just as much a genius as the poet and, like the poet, he is born, not made. It takes years of experience to tell accurately those characteristics that indicate a prepotent sire. Amos Cruickshank knew more about this sire business when he was 70 years old than when he was 30. I have not reached the three score and ten mark and do not feel that what I may have to say will be of especial interest to men who have had years more experience than myself, but it may be that what I have to say will prove of interest to the beginner, and possibly some help.

To begin with, I assume that a successful sire must be well bred—that he is good because of the carefully selected ancestry behind him, and I am thoroughly convinced that a bull, as well as a man, must have a good mother. Perhaps I am inclined to lay more stress on the dam than is justified, but I am firmly convinced that most of the great herd bulls follow the maternal side, and for that reason I would emphasize that the greatest point to be considered in the selection of a herd bull is the mother. I am not discounting the influence of the sire, but simply stressing the importance of the dam. As Tom Sotham used to say, a bull should be individually great by inheritance.

It is always advisable to select a tried and proven sire, but at the present time it takes a great deal of money to buy a developed bull and for that reason many breeders are buying bull calves and doing their own developing. Here again hinges a problem which can only be successfully solved by breeders of experience. The rearing of a bull calf to maturity can easily be a failure even if the calf looks well in its calfhood. The man and the feed bin will make the bull.

Now to refer to the more visible characteristics I look for.

Assuming that we have located a bull, either mature or a calf, that is bred to suit, he must be a good individual. Too many men buy on pedigrees and don't get enough bull!

An old Scotch sage is responsible for the maxim: "The head, the paunch and the hind legs are the three principal requirements for a great sire—the head indicating character; the paunch, feeding quality, and the hind legs the props to carry the meat when it is fed on."

The head of the herd bull has perhaps caused more difference of opinion than any other point. Men jump to conclusions and make bold statements, but the really great breeders — men who have studied the head and worked out this problem—say very little until the bull has reached his full development. Like most breeders, I like to start at the head and insist that the bull carry a head full of breed character (character can not be defined on paper—one gains a knowledge of what character means through observation and experience) and that he shows plenty of masculinity. With a calf I rather like to see what some might term a slight femininity, because I have observed that calves showing marked masculinity are apt to develop into rather coarse headed bulls. I like a short broad head—a typical head; a good clear open eye—and I prefer that the eye has a little "fire" in it—not a small, sleepy eye; the nostrils should be large, likewise the mouth, and the jaws strong. The neck should be fairly short and nicely crested, depending on age, and should carry the head with style and blend into the shoulders nicely. The shoulders should be well laid, not too coarse or open, and particularly do I want the shoulders well covered. The crops (just back of the shoulders) should be wide and well covered. The heart girth should be both wide and deep—plenty of circumference indicating constitution—and constitution is fundamental. The top line should be level to the tail setting and the ribs should show ample spring and length—thus making for paunch capacity; the underline should be practically parallel to the top line and by all means should the flank be well let down. The coupling should be short and the loin wide and thickly covered. The rump should carry out level and the width should be carried down into the quarters, and the hooks well covered. The legs, both front and hind, should be placed under "each corner" and should show plenty of bone. On top of all the above points I look for a thick covering of natural flesh — the thicker the better, but not fat—

Woodland, California,
February 28, 1919.

The California Cultivator as a medium for selling pure bred live stock is unquestionably delivering good service.

As evidence of its pulling powers we are pleased to state that the small ads that we have recently run have in each instance produced buyers. In the case of three bulls advertised in one issue, all were sold the following week and two orders were received for one of them.

Yours very truly,
A. W. MORRIS & SONS CORP.
By F. L. Morris.

The above letter is but another proof that the California Cultivator is reaching the class of readers who know and appreciate the value of pure bred live stock.

Retained After-birth

Cows can be made to clean easily without using force.

When cows do not clean properly after calving, it indicates a germ infection which is likely to run through the entire herd and result in Abortion and Barrenness.

The after-birth should be removed at once without force by means of the B-K douche and the cow treated to prevent her becoming an aborter or sterile. Authorities state that while there is no absolute cure for abortion and sterility, nevertheless the infection can be controlled by prompt treatment and the animal saved for successful breeding.

B-K is scientifically correct for this work. Used as a douche for the uterus, it quickly brings the after-birth, dissolves the slimy albuminous matter, kills the germs, stops discharges and controls the infection. B-K does not cause straining, but is soothing and heals the tissues.

Send for "evidence" and free Bulletin No. 52 "Contagious Abortion." If your dealer does not have B-K send us his name.

Address: Riverside, Calif.

P.S.—Will buy any good Dairy Herd or Beef Cattle

smoothly laid on and covered with a mellow good handling hide showing plenty of quality and a rich, mossy coat of hair. In a herd bull I want ruggedness, not coarseness, combined with quality, and in addition I want style and carriage and presence.

Some breeders like to show their herd bull during the different stages of his development. This practice has certain advantages, but likewise disadvantages. It allows the general public to watch him on the fair circuit and is often excellent advertising, but I am convinced that early and heavy fitting shortens the bull's career by three to six years. To get the best results from a really great bull I have my doubts as to whether he should ever be seen in the show ring. I can refer at this time to the great herd bull March Knight, who was never shown, and many breeders believe him to be the greatest heifer sire of the last quarter century.

I have tried to set down in a brief way a few of the things I have learned during a lifetime with Shorthorn cattle. I have left much unsaid, but one never reaches the point where he can be certain that he has mastered the breeding business The longer I handle cattle the more convinced I am of the value of carefully bred bulls and of the certain possibility of cattle improvement through the use of good bulls.

California has unexcelled natural conditions for cattle raising and some day this state will be a great live stock center. Just now we need many more herds of good pure bred cattle to help supply the existing demand for bulls and the big demand that is sure to come with each year.

Control of Tuberculosis on the Ranges

By F. M. Hayes, Assistant Professor Veterinary Science, University Farm, Davis

THE list of diseases affecting animals commonly fed upon the ranges of California is a long one. In it are included such important ones as infectious abortion, tuberculosis, anthrax, blackleg, sheep scab, sheep and calf parasitisms and plant poisoning. There are others of less importance. Blackleg and sheep scab, considered from the efficaciousness of the present methods of control, are not the menace that they once were. The others are still with us and instead of being controlled and reduced to a minimum are actually increasing in extent, particularly the abortion disease and tuberculosis.

That tuberculosis exists to any important extent among our range cattle may be considered in doubt by many people. It is, however, a fact and a reality which should be recognized so that methods of control that are applicable to range conditions may be inaugurated before the disease becomes as prevalent on the range as it is among the dairies of our interior valleys. It is estimated that from 10 to 15 per cent of the dairy cows in California are affected with this disease. This percentage, however, is no higher than exists in all other dairy sections of the United States, which means that we are not below the average, a fact of which there is no reason to be proud, when our remoteness from the congested animal population east of us, and our excellent climatic conditions are considered.

Tuberculosis among our range cattle does not exist, of course, to the same extent as it does in our dairy cattle which are kept under intensive systems that bring about closer contact between the healthy and diseased. There is every evidence, however, that this disease is gradually and insidiously, as is its nature, reaching the ranges. Range cattle of the beef breeds are just as susceptible to tuberculosis as dairy cows. This is proved by the fact that pure bred beef cows, kept under the same conditions as dairy cows, have just as much tuberculosis. The only reason that there is not as much of it among range handled cattle is that their environment is cleaner and the opportunities for spread by close contact are not so great. Evidence that cannot be disputed proves the paradox that tuberculosis does spread on the range where fresh air, pure water and sunlight abound in unrestricted quantities.

In 884 slaughtering plants in 263 cities, where the federal government makes inspection of food animals killed, there were 68,208 entire carcasses and 178,940 parts of carcasses of cattle condemned for tuberculosis in 1917. No small part of these condemnations were from the strictly beef breeds raised upon the ranges. The writer is not in possession of knowledge of what part of this loss to owners and to the food supply may be justly accredited to California. It is known, however, that there are grade and pure bred herds maintained under range conditions as well as some not under strictly range management that are notoriously affected with tuberculosis in California. On the other hand there are known herds under both conditions in which tuberculosis does not exist. The former fact is unpleasant to face, but the latter lightens the burden because therein lies one of the most important opportunities for the prevention and eradication of the disease among the range cattle.

While there probably is a great deal yet to be learned concerning the tubercle germ, its effect in the body, its existence outside the body and the manner in which it spreads, there is no reason for delaying the application of the principles and practices of control in the light of what we already know about it. We do know that the cow already affected is a center or focus from which the germs may spread from the manure, the milk, the genital and the respiratory organs. It is such individuals that must be located and removed by slaughter or strict separation from those cattle not yet diseased. The problem of doing this has its obstacles under range conditions but there is yet no better method than to apply the tuberculin test efficiently, systematically and courageously until the reactors are discovered. The disposal of those reacting will then depend upon their value and the opportunities on the individual ranch or range for proper segregation. It is not always necessary to slaughter reactors. In fact, in the case of valuable breeding cows and bulls it is not to be recommended unless they cannot be kept separate.

LIVE STOCK WEEK

University Farm, Davis, April 8-11.

Tuesday, April 8

Meeting of California Cattlemen's Association.
Sale of 50 Shorthorn bulls and females.

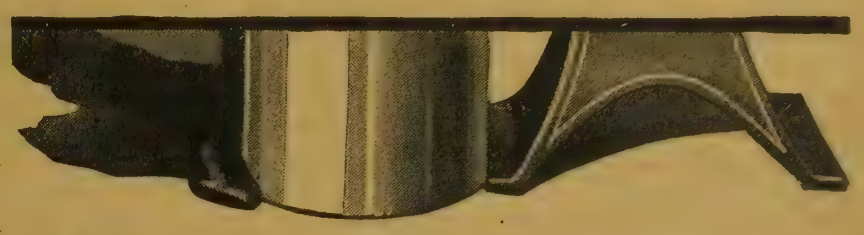
Wednesday, April 9

Meeting of California Cattlemen's Association.
Sale of 80 Hereford bulls and females.

Thursday, April 10

Meeting of California Swine Breeders' Association.
Sale of 25 Polled Hereford bulls and females, under auspices of American Polled Hereford Breeders' Association, State Fair Ground, Sacramento.

Friday, April 11



Meeting of Western Duroc-Jersey Breeders' Association.

The Best Time to Buy a

DE LAVAL

CREAM SEPARATOR

THE best time to buy a De Laval is when you need it most. With cows freshened, or freshening soon, you will have more milk to handle.

And with butter-fat at present prices you can't afford to lose any of it.

If you are still skimming by the "gravity" method or if you are trying to get along with an inferior or "half-worn-out" separator, you certainly are losing a lot of valuable butter-fat.

So you see that the combination of larger milk supply and a high price for butter-fat can mean only one thing—you need the best separator to be had

Right Now

The best cream separator you can get is the only machine you can afford to use these days, and creamerymen, dairy authorities and the 2,325,000 De Laval users all agree that the De Laval is the world's greatest cream saver. They know from experience that the De Laval is the most economical machine for them to use.

If you buy a De Laval you will get a machine that is tried and tested and true—a machine that will give you genuine service—and you will get the cleanest skimming, easiest turning, longest wearing cream separator that money can buy.

Order your De Laval now and let it begin saving cream for you right away. Remember that a De Laval may be bought for cash or on such liberal terms as to save its own cost. See the local De Laval agent, or, if you don't know him write to the nearest De Laval office as below.

California "Breed Promotion" Sales

Polled Herefords

State Fair Grounds

Sacramento, Cal.

Thursday, April 10, 1919

at 9 A.M.

25 Head Outstanding Individuals 25

Some Wonderfully Attractive Heifers
A Great Line Up of Young Bulls

Purely a "breed promotion" enterprise. About 20 of the most enthusiastic boosters of Polled Herefords in the United States have contributed twenty-five head of strictly high-class cattle to make the first sale of the breed ever held west of the Rocky Mountains. Each contributor has done his best to have a better animal in this sale than any of his fellow breeders. Cattle have gone here that could not have been bought at any price within reason at private treaty, but for the advancement of the interests of Polled Herefords in new territory they are consigned to this sale. "Strictly Choice" has been the requirement and nothing that will not be a real advertisement for the breed has been accepted.

California and other Western breeders will have rare opportunity to buy at their own door and at their own price very choice specimens of the breed. Every precaution has been taken by the association to see that the sale shall be so made up and so conducted as to result in future demand for hornless Herefords from the coast states.

Buyers unable to attend in person can safely send mail bids for anything in the offering. Nearly all these cattle are yearlings or just past two years old. They will stand the change in good shape and quickly become acclimated. They have their whole useful lifetime before them. They are old enough to show promise of what they will eventually develop into. Many of the yearlings can be shipped in crates by express if necessary and thus save time and money in getting them home.

SPECIAL NOTICE—Because of the importance of beginners getting started right and recognizing that most of the buyers will be establishing new herds, we have arranged for the presence of Mr. John Letham (dean of Hereford judges and newspaper men), to be at this sale to assist buyers in selecting cattle and appraising pedigrees. Mr. Letham is doubtless the best known breeder, feeder, fitter, and judge of Hereford cattle in America. He is everywhere recognized as a student of pedigrees and his services are always in demand wherever Herefords are known. Californians should avail themselves of this unusual privilege of getting the judgment of this man without cost. If you cannot attend, send your bids to Mr. Letham. If you do attend, get him to assist you in choosing. He knows cattle, pedigrees, and values as well, if not better than any man in the country, and his services are absolutely free.

Better service is assured by the advertiser if when writing you mention the California Cultivator.

In many instances a serious injury would result to the breeds in the loss of blood lines. On the other hand, if control of some sort is not attempted the loss will come, not so swiftly as from slaughtering, but slowly and certainly. The writer knows personally of several owners of pure bred beef breeds in whose herds tuberculosis has unfortunately gained such headway that the problem of eradication which they are now undertaking is requiring dauntless courage. Notwithstanding the fact that the immediate monetary loss will be heavy they realize as business men that tuberculous cows will not pay dividends in the long run. The other reason for endeavoring to exterminate the disease is the altruistic one that only healthy cows should represent the breed and that the purchaser of a pure bred bull or heifer should receive a guarantee of health.

The pure bred herd is going to be the foundation for the profitable development of the range cattle business. Therefore, if tuberculosis is not to spread to ranges now clean, the pure bred breeder must have tuberculosis free cattle and the purchaser must demand and receive record of a properly performed tuberculin test which indicates an absence of tuberculosis not only in the individuals purchased but in sufficient number of the entire herd to show that tuberculosis is entirely absent, or present in not over ten per cent of the herd. A similar idea is being developed by the bureau of animal industry in some of the Eastern states among pure bred herds in the form of establishing herds accredited free from tuberculosis after two or more tests show them to have no reactors. The advertising value of an officially recognized tuberculosis free herd is considerable. The plan, while susceptible to some faults, is nevertheless a step in the right direction.

Since there are yet in California ranges which are clean there is ample opportunity for the owner of a badly infected herd of grade cattle to replace the unhealthy by healthy from the clean range herds. This plan naturally would only appeal to the owners of grade herds in which cattle could be sold for slaughter for beef prices and the range restocked with grades at not far from the same price. The most economical method of handling tuberculosis grade cattle is to sell them for food purposes subject to inspection.

The writer has dealt in generalities in the above lines more than in specific details for the purpose of suggesting thoughts that are timely for the consideration of those interested in a profitable range cattle business in both the production of beef and pure bred breeding beef cattle. Nothing can be accomplished toward the prevention and eradication of tuberculosis on our ranges unless the progressive leaders of the industry realize its importance and cooperate to the fullest extent with all those concerned. It profits no man to raise a two-year-old steer at a cost of $60 and get the tankage price when sold to the packer, nor to raise a pure bred heifer or bull that should be worth $250 if she did not have tuberculosis.

DISTINGUISHED LIVE STOCK MEN TO VISIT CALIFORNIA

Not since the Panama Pacific International Exposition has this state attracted so many prominent and nationally known live stock men as will be in this state the week of April 7-12. Apparently the Eastern live stock world is turning its eyes toward this state as a very attractive field for development and the various breed associations are each making strenuous efforts to build up their influence in this state.

During the week Coast breeders will have an opportunity to meet the following men:

Frank W. Harding, secretary of the American Shorthorn Breeders' Association, Chicago; R. J. Kinzer, secretary of the American Hereford Breeders' Association, Kansas City; B. O. Gammon, secretary of the American Polled Hereford Breeders' Association; John Letham of the American Hereford Journal, Kansas City; Fred Reppert, Decatur, Iowa, one of the most popular auctioneers in the United States, and O. M. Plummer, manager of the Pacific International Live Stock Exposition, Portland.

SANTA ANITA RANCHO

Anoakia Breeding Farm

Arabian-Thoroughbreds

Out of our choicest thoroughbred mares and sired by our famous imported stallion Ibn Mahruss we are offering some splendid two year olds. Also some especially desirable young saddle stock sired by Ibn Mahruss, world renowned Arabian desert stallion and Don Castano, five gaited saddle stallion, winner in many prominent shows.

Mammoth Jacks

We have for sale a number of two and three year old jacks, big, growthy fellows of exceptional breeding and quality.

Poland China and Berkshire Boars

Sired by the World's Fair winners, BANKER'S BOY and KINTYRE LAIRD, and by others of our herd boars of equal breeding.

New Harness

is cheaper than second-hand, dollar for dollar of cost. Come in and see what we have to offer you in HERCULES HARNESS and Horse Collars. Our own make and fully guaranteed.
Stallion collars made to order.

W. Davis & Sons

California's Pioneer Harness Manufacturers, 333 Market Street,
SAN FRANCISCO, CAL.

Catalogue of Harness, Saddlery, Trunks and Traveling Bags sent free on request.

Use a Shorthorn Bull

and add 200 pounds to every steer you raise. A load of Shorthorn yearlings sold for $20.75 at Denver in January, the record price for feeders. Four loads of Shorthorn steers brought $524, $361, $358, and $349 per head at Chicago in December. Why not start a Shorthorn herd by putting in two or three registered females and keeping the female increase? You would soon have a valuable herd at small cost. Pure breds pay the best.

Holstein Veal

No Kind or Quality of Veal is so much in demand as that of the Holstein-Friesian breed. It is an important source of revenue to Holstein dairymen, adding an important item to the credit side of the dairy farmer's account. Holstein calves weigh 100 to 135 pounds at birth.

Strictly big type Polands of best blood lines properly developed. Bred sows and gilts, and a few fall boars for sale at prices that are reasonable. Satisfaction guaranteed. **R. J. Yates, Orland, Calif.**

CALIFORNIA OPPORTUNITIES IN BEEF

Continued from Page 441

From the standpoint of beef cattle this state is woefully understocked for its own needs, not to mention any possible needs from adjoining states. That this is true is attested to by the fact that each year hundreds of high grade and pure bred bulls are shipped in for distribution among range outfits. There is not one sound reason why such a condition should exist. California should at least produce enough bulls to supply her own needs. California should produce a surplus of bulls that would be readily absorbed by the vast cattle country to the north, east and south. It can be done —will be done in time—but it can only be accomplished through the establishment of many new herds — and that means more females. Aside from the few head of females that the breeders contribute to the annual sales, a buyer would have difficulty in buying 50 head with which to found a herd. Of course, they are here, but the men who are producing them are not anxious to sell, preferring to add them to their own herds.

It is generally conceded that the pure bred beef herds in this state could be increased ten-fold and still not produce enough bulls to supply the existing demand. If this is true, and there is ample evidence that it is true, it would seem that it is but logical to predict an attractive future for the beef industry in this state.

In brief, then, here are the conditions that exist in this state:

California is the natural breeding ground for a vast territory that will always be a cattle country.

There is a constant demand for better cattle.

Because of natural conditions it is possible to produce in this state the very highest class of cattle — and cheaper than any section of the world.

California breeders do not produce enough bulls, by thousands, to supply the present demand.

Our own needs and the certain demand from adjoining states furnish a basis for the establishment of many new pure bred herds.

CATTLEMEN'S CONVENTION AT UNIVERSITY FARM

The opportunity will be afforded cattlemen attending the Shorthorn sale to be present at the convention of California cattlemen to be held afternoons at the University Farm, Davis, on April 8 and 9. While the program for the cattlemen's convention is not yet complete, we are authorized to announce that Gilbert J. Waller, founder of the Hawaiian Meat Company, will make an address outlining the details of the method employed in establishing the cooperative system among cattle producers now in vogue in the Hawaiian Islands.

O. M. Plummer, general manager of the Pacific International Livestock Exhibition at Portland, Oregon, will deliver a talk and in his direct way enlighten those present on the market systems practiced in other states.

OPPORTUNITY FOR DAIRYMEN

April 2, 3 and 4 will certainly be red letter days for buyers looking for pure bred and grade Holsteins in the San Joaquin Valley. Immediately following the Putz and Mitchell sales of registered Holsteins at Hanford and Visalia on April 2 and 3 respectively, Mr. C. L. Knestric of Reedley will dispose of his entire herd of Holsteins at public sale.

Mr. Knestric has been in the dairy business for a number of years and the herd that he is offering on April 4 is the result of 15 years of breeding. Without a doubt it is one of the finest herds of grade Holsteins that has ever been offered at public sale for a long time. And while they are grade cows they are practically fifteen-sixteenths pure bred.

Mr. Knestric also has several head of registered Holsteins which will be sold. This should interest buyers who might attend the two preceding sales and be short a few head to fill a car.

Mr. Knestric's ranch is located just three miles south of Reedley and seven miles east of Kingsburg on the highway between Kingsburg and Sanger.

The sale will be conducted by Col. John A. Rhoades of Los Angeles, who is also conducting the Putz and Mitchell sales.

84 Registered Herefords 84

At Public Auction

1 P. M., WEDNESDAY, APRIL 9, 1919

UNIVERSITY FARM, DAVIS, CALIFORNIA

56 FEMALES - 28 BULLS

Tuberculin Tested - - Guaranteed Breeders

Size, Quick Maturity, Uniformity --- HEREFORDS

Establish a Hereford Breeding Herd Now

Success depends not so greatly on how much you invest as how well you invest. Brains, labor, and money invested in good registered Herefords right now will prove to be well invested right from the start, for there is a waiting market for Hereford breeding stock in the west that is steadily growing.

Buy the Right Foundation in this Sale

Leading western breeders have consigned to this sale choice young cows and heifers, richly bred, and the right sort to use as foundation stock. Many of the cows have calves at foot, and the bred females are in calf to such bulls as CALIFORNIA PRIME DONALD, Grand Champion at 1918 California State Fair; ALAMO REUBEN, who topped the sale last year as a senior calf; HARRIS STANDARD 2ND, sire of Alamo Reuben; and others of high merit.

Bulls to Head Registered Herds

Not only can you buy foundation females in this sale but you can secure a read herd header as well, there being an excellent selection from which to choose.

Range Bulls of Size and Quality

There are some extra choice bulls suitable for range service in the offering. Remember that these bulls were bred in California and needing no acclimation will go right ahead from the day you get them home. They will breed profit into your herd, getting offspring that will market at earlier ages with greater size and uniformity.

Get Bigger Money Harvests Easier

You farmers can save *all* the grain you raise—with an E-B Osborne Grain Binder.

Cutter bar can be set close to the ground. Reel can be adjusted to push down grain onto platform. Platform canvas runs one-seventh faster than elevator, straightening grain before elevating. Seventh roller avoids grain dropping through onto main wheel and helps prevent clogging. Drop leaves, grain springs and three discharge arms prevent stringing grain. Get all the interesting harvesting facts about the

E-B Osborne Grain Binder

from your dealer at once—or write us.

The uniting of E-B with Osborne means much to you in harvesting your crops. The Emerson-Brantingham Implement Company represents an organization of 4,000 men and 7 factories, and 67 years' experience in building fine farm machinery. Combined with this is the Osborne reputation for making harvesting machinery of all kinds.

Whittier, California

When writing advertisers, mention The Cultivator.

Second Spring Shorthorn Sale

Glowing accounts reach us as to the quality of the cattle entered in the second spring sale of Shorthorns to be held under the auspices of the California Shorthorn Breeders' Association. The opportunity will be afforded of selecting choice herd headers. For instance, the London Estate is entering the great bull Roselawn Choice, while the University of California has an excellent offering in California Model, sired by the bull which produced the great steer, California Favorite. A half brother of this calf sold at the recent Harding sale for $7,500.

It is said that "coming events cast their shadows before," and if this be true breeders of Shorthorns in the state have a great future in prospect. Never before in our history has there been such an appreciation of the merit of quality cattle and where, up to within the past few years, those broad-minded men who engaged in the production of pure-bred cattle played quite a hazardous part, the beneficial results of their efforts warrant both profit and pleasure to those now engaged in the business.

It is earnestly to be hoped that a strong attendance will be in evidence at the Shorthorn sale, and this seems assured by reason of the fact that a convention of California cattlemen will be held at the University farm, Davis, on the mornings of April 8 and 9, at which time the matter of improved marketing conditions will be gone fully into, free discussion had, and addresses made by men eminent in their knowledge of marketing, from this and neighboring states.

Veterinary Queries

Answers in this column by Dr. Wm. Petrie, 2714 South Harvard Boulevard, Los Angeles, are without charge. For immediate mail answer remit $1.00. In writing questions give full symptoms or particulars of injury of animal.

Unsigned communications receive no attention.

Lump on Cow's Jaw

I have a Holstein cow that has a bad spot under the jaw. It started about four months ago with only a small lump which I lanced, removed some pus and sponged out with disinfectant. It grows continually and is now about three inches across. On the outside of the raw spot there is a ridge or roll as though the skin had been rolled back. Have used bluestone water and sulphur on it but it is getting worse.—Subscriber, Stockton.

It may be caused by an injury or may be the real lump jaw (Actinomycosis) which is caused by a germ getting into the bone through the gums. This can only be cured by the continuous use of iodine for some time. Wet the lump with the tincture of iodine once a day. For internal use get four ounces of iodide of potash dissolved in a quart of water. Give once ounce of the solution in the feed or in the drinking water once a day while it lasts. Better call in a veterinarian to see the cow.

Ewes With Blue Bags

Please advise through the Cultivator what would be a good treatment for ewes having blue bags.—Subscriber, Los Angeles.

The blue udder is caused by inflammation and may be due to an injury or from influenza. Sheep are usually considered healthy, hearty animals, but at this time of the year they are apt to get bilious and in such condition are subject to all kinds of troubles. They need a bitter tonic to stir up the liver and eliminate the bile. Give each one ten grains of aloes and five grains of powdered nux vomica mixed with two tablespoons of raw linseed oil. Repeat by giving half the dose in a few days.

Warts

We have a heifer calf that has large warts on her neck. Please advise us what to do for it.—Subscriber, Aguanga.

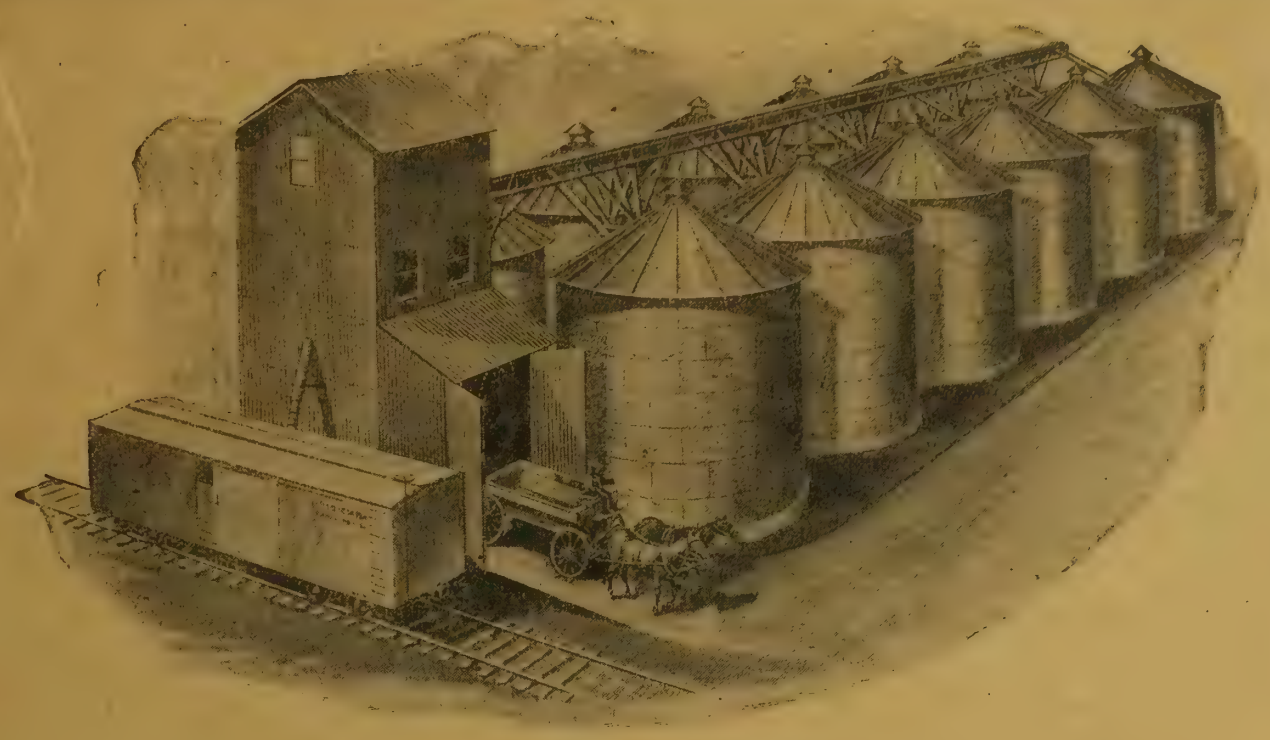
Oil them once a day with castor oil and they may go away soon; if not then use nitric acid. Apply the acid with a swab once or twice a week. Be careful with the acid and do not allow it to touch your skin or clothing. It is a powerful caustic and will burn a hole.

Pigs With Sore Eyes

We have some two weeks old pigs that have sores about the head and nose that seem to come from the eyes. The eyes are swollen and they cannot see well. The mother seems to be all right.—Subscriber, San Andreas.

Bathe the sore parts with a solution of permanganate of potash. Use warm water and put in enough to make the water red. While the eyes are affected keep them in a dark place but keep them clean and warm.

Worms in Goats



I have a buck and several does suffering from vent gleet. Two of the does passed thread-like worms. I have been giving them worm powders and also injecting a one per cent solution of Lysol but am unable to effect a cure. Please advise what to do.—Subscriber, Inglewood.

Worms are rather uncommon in goats. Give each one a teaspoon of the tincture of iron in the mash once a day for a week. You might also inject a solution of the tincture of iron, a teaspoon to the pint of warm water. If the iron causes constipation give a dose of salts, two parts of epsom salts to one part of common salt. About two tablespoons dissolved in warm water is a good dose.

Sick Goat

I purchased a milch goat about three weeks before kidding time. She now has three kids born about three weeks ago. The mother goat refuses to eat very much and will not drink more than once a day. When she has her choice of green stuff or barley hay she chooses the latter. She was a heavy milker last year, giving four quarts a day, while this year she only gives a scant two quarts. The udder is large but the upper part is much firmer than ordinary and there are clots of blood in the milk. When milked she humps up her back as though it hurt her. Several times when passing urine she has passed a quantity of bloody matter. The manure is not always in hard balls but is soft and hangs together. What would you advise doing for her?—Subscriber, Oceanside.

Probably a part of the afterbirth was retained. That would cause the bloody discharge with the urine and also the congestion of the udder. When milking her you should be very careful not to pull on the teats; it will cause great pain. Use a syringe with a long nozzle and wash out the womb with a warm one per cent solution of lysol or zenoleum. Be sure the solution is just a little above the temperature of the body and use plenty of it. Also be sure it goes well back into the womb. Repeat this in two or three days. A good dose of salts will also help. Give two tablespoons of epsom salts, one of common salt and ten grains of powdered nux vomica. Dissolve it in a pint of warm water and give it as a drench. The fact of her having three kids would make her very weak at the time and she was not able to expel the afterbirth. It should have been removed at the time and the womb washed out.

Connecting the Grain Grower with his Market

Twelve-Bin (Twin-six) Loading Station with a Capacity of 73,068 Bushels

GROWING interest among California farmers in handling grain in bulk, the simpler, more economical way, has developed this twin-six loading station. It is constructed especially for use in sections of large grain acreage, where long hauls are necessary. The unit illustrated is planned for such a section in the Sacramento Valley. The Calco Grain Loading Station offers grain growers an economical, co-operative method of connecting grower and shipper, to their mutual advantage.

Armco Galvanized Iron Bins

Twelve Armco Galvanized Iron bins, each 22 feet 1 inch in diameter and 21 feet 5 inches in height, give this twin-six loading station a storage capacity of 73,068 bushels of bulk grain.

Handles 1000 Bushels per Hour

Grain is hauled by team or truck through the elevator house, where it is dumped into a receiving pit below grade. A conveyor system elevates the grain to the tower, where it is cleaned and weighed and then either conveyed for storage to one of the bins or spouted directly into waiting cars. Minneapolis buckets, 8 by 5, operating at a speed of 440 feet per minute, give this unit a handling capacity of 1000 bushels of bulk grain per hour, making it adequately fast to care for any possible congestion.

Erected on Concrete Base

All galvanized iron bins are erected on concrete bases, are weather, fire and vermin proof. The tower is constructed of fire-proof, rust-resisting Armco Corrugated Iron.

Cost per Bushel Capacity is Low

This 73,068-bushel capacity loading station may be erected at a cost of $0.234 per bushel storage capacity. Compared with a reinforced concrete structure—the only available type offering protection from fire, weather and vermin—this cost is exceptionally low. A concrete elevator for a similar capacity will cost nearly three times as much as this Loading Station.

Permanent Erection in 60 Days

With an ordinary working force of men, this complete structure may be erected within 60 days. This erection time includes the elevator building, concrete foundations, conveyor system, cleaning and weighing machinery and the 12 Calco Galvanized Iron Bins. From four to six months are necessary to erect a storage station of similar capacity in concrete.

Capacities to suit local conditions may be easily arranged by merely adding bins in units of two to the Calco Loading Station, or subtracting bins in units of two.

Blue prints with itemized costs for erection of the Calco Twelve-Bin (twin-six) Loading Station will be furnished engineers or co-operative grain growers' organizations, and our engineers will gladly assist in every way to adapt this unit to local conditions. Write for our circular giving costs and points of erection of this loading station. Mailed upon request.

AT PUBLIC AUCTION

Thursday, April 3, 1919

PACKWOOD FARM, VISALIA, CAL.

Owned by W. F. Mitchell

Fayne Spring Farm Pontiac De Kol

Daughter of Spring Farm King Pontiac 6th. Now on official test and has to her credit 26.29 pounds butter in seven days as a senior four year old. One of the most highly bred heifers ever sold in California.

FOURTEEN COWS AND HEIFERS WITH OFFICIAL RECORDS UP TO OVER 31 POUNDS BUTTER IN SEVEN DAYS, including the great 31 pound cow Fidessa Helena, and the beautiful four year old pictured above. There are some real cows and heifers in this sale, the kind you can very profitably buy for foundation stock.

NINETEEN GRANDDAUGHTERS OF SEGIS PONTIAC DE KOL BURKE, whose two year old daughters hold both California records for butter in one year, and whose daughters are making big records as they freshen, one of them now on test having to her credit over 26 pounds butter in seven days as a junior two year old.

THIRTY-NINE COWS AND HEIFERS BRED TO PRINCE HISKE WALKER are in this sale and buyers who are fortunate enough to get some of them are bound to realize handsomely on the investment, for this great young sire is without question one of the most promising bulls now in service in California.

PRINCE HISKE WALKER will be sold, for the sole reason that Mr. Mitchell is retaining only the young daughters of this great bull as his future breeding herd. Prince Hiske Walker is only just past four years old, and will undoubtedly have at least 60 living daughters before he is five. His get is uniformly of high excellence.

DON'T MISS THE OPPORTUNITIES OF THIS SALE. EVERY FEMALE OF MILKING AGE IN THE HERD WILL BE SOLD.

Catalog free on request.

70 Choice Holstein Cows and Heifers 70

7 Registered Holstein Cows and Heifers 7

Registered Holstein Bull

On the C. L. Knestric Ranch, three miles south of

REEDLEY

Three miles west of Dinuba, seven miles east of Kingsburg on the highway between Kingsburg and Dinuba

Friday, April 4th, at 9 a. m., Sharp

It has taken the owner 15 years of constructive breeding to build this fine herd up to its present state of efficiency. Nothing but the best pure bred, registered Holstein sires have been used and any cow that did not show a profitable production was taken. The heifers were all raised from the best cows, and include 40 head from 6 to 24 months old. There are several high-class springers in the lot. Remember in buying from this herd you are securing two nicely marked, big, growthy, young Holstein cows and some extra good heifers.

One fine three year old registered Holstein cow, milking with first calf. Six registered Holstein heifers. This stock is royally bred and nice individuals.

One three year old registered Holstein bull from the Holdridge herd. Six brood sows with pigs at side.

TERMS: CASH. Arrangements for credit can be made by seeing owner prior to sale.

If you are in the market for first-class dairy cattle, do not miss this

SHORTHORNS IN CALIFORNIA

Continued from Page 443

To one who is interested in the history of the breed a study of herd books reveals quite an array of Shorthorn breeders in California, but a list of such might not appeal to readers of the California Cultivator as much as some facts about present day conditions. But before turning from the historical phase of the question under consideration, I desire to comment briefly on a herd established near the date last mentioned, which proved a source of much strength and a fountainhead of good blood for the Shorthorn herds of the entire Pacific Coast, many herds in California profiting from it as well as those of the Northwest. I refer to the herd established near Portland, Oregon, by Ladd & Reed, but owned during its period of greatest usefulness by Charles E. Ladd. This herd was the distributor of many excellent Shorthorns and from it came blood that greatly improved many herds in California. In addition to this source of strength and improvement, numerous choice animals, both bulls and cows, have in recent years been purchased from the leading herds of the cornbelt states. Many of these were prize winners in the East and are reproducing their merit in their Western homes. The purchase of notable prize winners in most cases is commendable as a means of advertising, but the chief aim in such additions should be the improvement of the herd by the introduction of better animals for use as breeders. The exhibition of fine specimens is commendable and should be encouraged as a practical means of advertising and as stimulus to other breeders to produce better live stock, but the chief aim of every breeder should be to improve his own herd and the breed. It is a greater honor to produce a notable prize winner than to exhibit one.

Shorthorns were the first improved breed of beef cattle brought to America, in fact they have been the pioneers in the improvement of the scrub cattle of many countries. A fruitful field for it as improved blood, some generations ago, were the vast ranges and grassy plains where the degenerate descendants of the Spanish cattle roamed at will. Several generations of Shorthorn bulls made a wonderful improvement on these wild cattle, improving their forms, decreasing their horns, refining their appearance, thus furnishing an excellent foundation on which the Herefords afterward builded so successfully. This is an old story to the ranchmen of California, but its repetition here is justified as a means of giving proper credit to Shorthorns as great improvers. But not alone in the big ranches of California and elsewhere was this improving and refining so potent, but in its numerous valleys and in its small mountainside ranches. Almost everywhere Shorthorn blood is in evidence, in greater or less degree, and always has it been an improver. To a very large extent this improvement has gone out from the good herds of Shorthorns established in California many years ago. Some of these herds still exist, having descended from father to son, and in late years many new ones have been established on the solid foundation of individual merit and good breeding.

There are now 100 herds of registered Shorthorns in California and many hundred of grade herds where Shorthorn blood predominates. And an encouraging condition of trade is that the demand for Shorthorns is increasing rapidly. A prominent cattle broker in Southern California who is an ardent admirer of another breed admitted that his largest orders were for Shorthorns. But there is room for all good breeds to improve the beef form and refine the appearance of numerous herds of scrubs and to stock

the vast unoccupied acres in California with profitable cattle. For some years states in the corn belt with from 30 to 50 cattle to the square mile have strongly emphasized the scarcity of cattle, but the three Pacific Coast states have only three cattle to the square mile and less than 15 people. Surely there is room here for more of both, and in the filling up of these unocupied lands by men who are seeking new homes will come a constantly increasing demand for Shorthorns.

In all countries they have proven their merit as the farmer's cattle. In supplying his family with both beef and milk no breed can equal Shorthorns. In the future development of our country, California will play an influential part, and in no field of endeavor is there greater hope of marked progress than in the unfolding and improvement of her live stock industry. This industry is yet in its infancy, but its future growth and proper development offers encouragement for all good breeds. In the fulfillment of this reasonable expectation the Shorthorn will play an important part.

LIVE STOCK NEWS NOTES

More Herefords to California

Two progressive California breeders of Herefords, Chas. Rule of Jenner and W. J. Bemmerly of Woodland, were among the best buyers at the Hereford Roundup sale held at Kansas City March 3-6, each securing a number of well bred young bulls.

Among the Rule purchases were the following: Beau Robin by Delphino, calved February 25, 1917.

Repeater 198th, by Repeater 71st, calved October 19th, 1917.

Prince Fairfax, by Peerless Prince, calved September 8, 1917.

Rule also selected the heifer Matron Donald 2d, a daughter of Beau Donald 193rd.

Included in the Bemmerly selections were:

Saxon Lad, by Columbus Lad 6th, calved March 30th, 1917.

Lincoln Lad, by Beau Lincoln 7th, calved February 18th, 1917.

Hanley Picture, by Manly Picture, calved November 5, 1917.

Nifty Lad, by J. H. Cedar Lawn, calved February 23, 1917.

Sensation, by Belle's Picture, calved March 15, 1917.

Horace Gleed 40th, by Horace Gleed, calved April 25, 1917.

California can use a lot more bulls of the sort Bemmerly and Rule brought out.

Hereford Bull Sets World Record Price

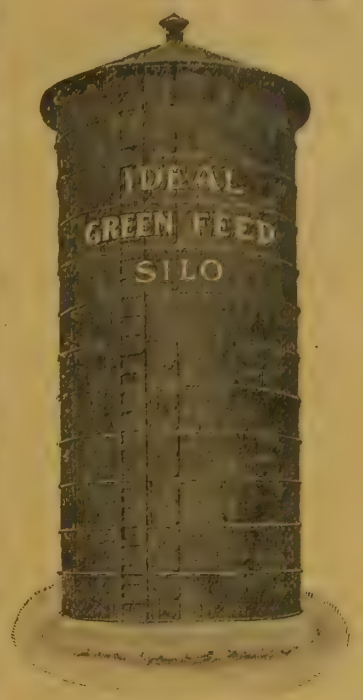
A new world's record price for a bull of any beef breed was established when Ferguson Bros. of Canby, Minnesota, paid $50,000 to L. A. Pinnard of Wesington Springs, South Dakota, for the Hereford bull Richard Fairfax 449317.

Richard Fairfax was bred by Warren T. McCray, Kentland, Indiana, and was sired by the noted bull Perfection Fairfax. His dam was Real Lady by Beau Real and his second dam was by Dale, the grandsire of Perfection Fairfax, and the first Hereford bull to sell for $10,000.

The former record was held by the dead Ardmore and was established at the 1917 International when W. R. Pickering of Kansas City paid Walter L. Yost $31,000 for him.

Buys Crack Hereford Bull

H. H. Gable, Esparto, president of the Pacific Coast Hereford Breeders Association, has purchased, through R. M. Dunlap, the Hereford bull, Don Perfect 2nd.



This bull has been one of the herd bulls in service in the C. C. Griffith herd, Hudson, Iowa, and Eastern advices state that he is not only a splendid individual but has proven a sire of rare quality, his get having topped a number of good Iowa sales.

California Hereford interests will be greatly strengthened by the addition of this bull and it is expected that he will be given wide opportunity in the Diamond G herd.

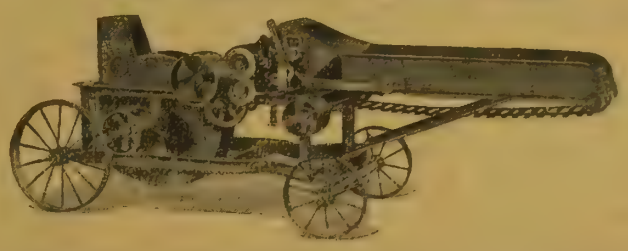
Inyo County White Faces

Hereford breeder at Bishop, Inyo County, reports sale of a bunch of pure breds to O. Harris of Missouri, and to S. R. Crow, Pleasanton; also sale of 20 bulls to the Tehachapi Cattle Company at Bakersfield.

Here's the Way to Get the Big Milk Flow

(1) Put that first alfalfa crop into an Ideal Green Feed Silo.

(2) Feed it out as silage this summer when green feed is gone.



(3) Refill with corn this fall.

(4) Feed succulent corn silage all winter. That's the way to cut feed costs.

THE rigid, exacting specification under which Ideal Green Feed Silos are made, their acknowledged superior design and our reputation for quality dairy equipment is your guarantee of a sound serviceable silo. Let us describe it to you.

Dispersal Sale

45 Registered Holstein Cows, Heifers and Bulls

45 High Grade Holstein Cows and Heifers

Wednesday, April 2, 1919

E. R. Putz Ranch, Near Laton, California

Mr. Putz is retiring from the breeding and dairy business and has instructed us to conduct a complete dispersal sale of his well known herd of profitable producers.

While no official testing has been done in the herd, the blood lines are substantial, representing some of the most popular lines of the breed, and the cattle are practically all young, clean, and good producers. This herd contains

24 Greatgranddaughters of Pontiac Korndyke

3 Daughters of Arcady Pontiac Wayne Hengerveld

3 Daughters of Prince Beauty Pieterje Segis

Besides the desirable young cows and bred heifers in the herd, there is a very desirable lot of unbred heifers and heifer calves that will grow into money fast for someone. Dairymen will also find some choice young bulls in this sale, although there are only a few bulls from this herd have been in strong demand and few have stayed in the herd long enough to reach service age.

The Grade Cows and Heifers

are a well marked lot, young, clean, good producers, and all that are bred are in calf to a grandson of Pontiac Korndyke, the present herd sire. Here is an opportunity to buy some grade Holsteins of high quality.

Prince Lunde Korndyke 2nd

the herd sire will be sold. He is a grandson of Pontiac Korndyke and is a fine individual. See this bull and then look over his calves in the herd and you will find that he is getting some exceptionally promising heifers.

Every animal in the sale over six months of age, both purebreds and grades, is tuberculin tested.

THE FARM is nine miles north of Hanford on paved County Highway; three and one-half miles east of Laton; ten miles west of Kingsburg.

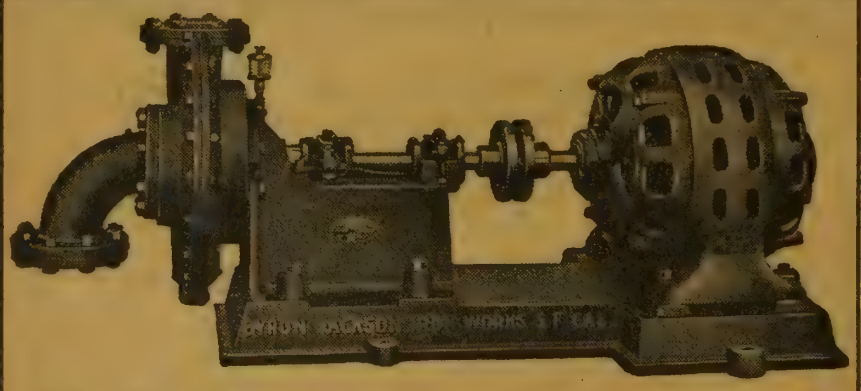
Leaks Soon Drain the Radiator!

THE easiest and quickest way to repair leaks in radiators, pumps, water jackets, motor head gaskets, hose connections, etc., is with Johnson's Radiator Cement. It will stop leaks immediately without laying up the car—no mechanical experience required—all you have to do is remove the cap and pour the Radiator Cement in the radiator. No tool kit complete without a can of Johnson's Radiator Cement. It overcomes the inconvenience of laying up ones car—will ordinarily seal a leak in from two to ten minutes.



JOHNSON'S RADIATOR CEMENT

Johnson's Radiator Cement contains nothing which can clog or coat the cooling system and is absolutely harmless in every respect. It blends perfectly with the water until it reaches the leaks. Just as soon as it comes in contact with the air it forms a hard, tough, pressure-resisting substance which is insoluble in water and consequently makes a permanent seal.

A half-pint of Johnson's Radiator Cement is ordinarily sufficient for a Ford or other small radiator—for medium size cooling systems use a pint and for large cooling systems, a quart.
For sale by Hardware, Accessory dealers and Garages. Write for our booklet on Keeping Cars Young—it's free.

Seven Rules for Feeding Chicks

By Jean A. Koethen

IT IS a good deal easier to give directions for feeding chicks than to obey them. The chick is a patient little creature, demands nothing, asks for nothing. If it is too flagrantly abused, it droops and dies; given the most grudging attention, it lives and grows, and by the time it has developed into a worthless runt it is too late to go back and correct errors of care and feeding. You cannot neglect a chick for a week and then make up for the neglect by extra care. The lost time is gone forever, and with it, perhaps, the chance of making a blue ribbon bird. One little back set, a cold, a chill or an empty crop for a few nights, and you have a cull in place of the beautiful standard fowl you might have had. On such small matters as getting home to feed the chicks at their regular time, or scalding the fountains weekly, does the building up of a fine flock depend.

Chick feeding is not an exact science. The kind of feed is important, but no more important than the way in which it is fed and the ability of the chick to digest what it receives. And so my first rule for chick feeding has to do with the chick itself rather than with its ration.

Keep the Chicks Warm

No chick can digest its food if it is chilly. The chicks must be warm, real cuddly, toasty warm, before they are fed, and afterward. Chill checks every digestive process. If chicks "paste up behind", don't lay it to their feed. That is the surest sign of indigestion caused by chill. Warmth is especially important the first four days. After this time the chick hardens rapidly and can soon bear a good deal of cold during the day, but it must be warm at night always. We are told that chicks must always be sent to bed with full crops, but if bed is a comfortless place where they must huddle to keep warm, that cropful of feed will cause diarrhoea rather than normal growth. Keep them warm if you have to sit up all night to do it.

Do Not Feed Too Soon

No chick cares to eat before it has been out of the shell 24 hours. The last day it was in the shell it took into its own intestines the yolk of the egg from which it hatched, and this is ample nourishment for 48 hours or longer. Some authorities would leave the chick without any nourishment save a little sand or grit for from 60 to 72 hours, but most experts feed by the end of the first 48 hours. By this time the chicks have begun to look for something to peck at, and they are pretty good judges of their own need. My own experience is that chicks will not eat until they have been out long enough to make feeding perfectly safe. The first feed is usually rolled oats or chick feed scattered on sand where the chicks can see it plainly. There is nothing better than the hard boiled egg chopped with stale bread which was so generally prescribed for the nursery feed a few years ago. The only objection to this is that it is some trouble and no more satisfactory in the long run than simpler feeds.

Feed Plenty

The first three or four days the chicks are learning to eat and cannot be expected to fill their crops. For the purpose of teaching them experts at the University Farm keep a grain mixture of equal parts fine cracked wheat, fine cracked corn and steel cut oats before the chicks in a wooden hopper all the time for the first two days. As soon as they have learned to eat the grain is scattered on the sand for another day so that they may learn to scratch. From this time on all the grain is scattered in a light litter of cut alfalfa or clover. At the Missouri experiment station the first feed is a fountain of sour milk or buttermilk. This is followed the afternoon of the second day in the brooder by a mixture of two-thirds rolled oats and one-third wheat bran, with a little charcoal, fed on a clean board four or five times a day. After the fourth day commercial chick feed is added to the mixture.

By the Cornell method, which has a very large following, the chicks are given a moist mash five times a day right from the start. The mash mixture consists of eight pounds rolled oats, eight pounds bread or cracker crumbs, two pounds sifted beef scrap and one pound bone meal. This is moistened with sour milk or buttermilk. The grain mixture, three pounds cracked wheat, two pounds cracked corn, one pound steel cut oats, is kept before them in a little tray. After the fifth day the mash mixture is changed to three pounds bran, three pounds corn meal, three pounds middlings and three pounds beef scrap, one pound bone meal, and is kept before them all the time.

The difference between the above rations is sufficient proof, if proof were needed, of the fact that there is no one best ration and no one best method of feeding. Some feeders leave the feed before the chicks constantly after they have learned to eat; others prefer to feed several times a day. It does not matter which method is followed, so long as one is sure every chick has all it will eat, but most of us feel that the weaker chicks have a better chance if the feed is always before them so that they may eat at any time. When a moist mash is fed in a trough or on a board the stronger chicks are always likely to crowd the weaker away. As to the time honored question, shall the mash be dry or moist, many feeders answer it by feeding it both ways, the dry mash always before the chicks in hoppers, the moist mash, mixed with buttermilk, once or twice a day in addition to the dry. Chicks like a moist mash. It appeals to their appetities as a dry mash does not, and they grow more rapidly if they have it. Growing chicks is largely a question of getting the greatest possible amount of food into them. You cannot overfeed a chick. You may feed him more than he can digest if his digestion is not in good working order, but given a normal digestion the chick will not eat more than he can digest. Here is where chicks have more intelligence than some folks. A chick's crop ought to be stuffed full when he goes to bed. If it is not, there is something wrong either with the chick or the ration.

Feed a Variety

Probably one reason why so many chicks fail to reach standard weight is that they are not fed a sufficient variety. A chick's ration, like that of the adult fowl, must consist of grit, grains, greens and grubs, or animal food, and no one of these can be omitted. Chicks that have sour milk daily need no meat if they have all the milk they will eat, but most feeders give meat in the form of beef scrap in addition to the milk. There are so many buttermilk preparations on the market nowadays that no one need go without some form of this most excellent chick food. It is important that a variety of grains be fed, both in the mash and in the scratch mixture, so that the chick may have everything it needs for a symmetrical development and that its appetite may be constantly stimulated.

Feed for Bone and Muscle

Ultimately we want our chicks fat, but before we begin to put fat on them we must have a frame to cover. This is one reason why rolled oats are part of nearly every nursery feed. Oats are one of the best of bone and muscle builders and they should be part of the ration from start almost to finish—rolled or steel cut oats first, then sprouted oats and later ground oats in the mash. If we were deprived of every other feed I fancy our chicks would do fairly well on a ration of oats alone, so nearly do they come to being the perfect feed.

But we need bones of firm quality as well as large ones, and so bone meal should be a part of the chick mash. Chicks that have bone meal in the mash are not likely to be troubled with leg weakness.

Another element needed for bone and muscle, as well as for feathers, is protein. Little chicks need even more protein than laying hens. Buttermilk, beef scrap, raw or cooked meat, are all sources of protein. All grains contain protein, but they do not

contain enough. Some special protein feed must be added.

Feed for Health

I have mentioned buttermilk as necessary both to a varied ration and to the building of frame and muscle, but for it is even more necessary to health. Buttermilk (and when I say buttermilk I mean any kind of sour milk) because of the lactic acid it contains, is particularly efficient in keeping down the bacteria which cause white diarrhoea. It is also the only known cure for coccidiosis. Tests at various experiment stations have shown that chicks which were given buttermilk from the start were much less liable to diarrhoea than chicks which had no buttermilk. Even butter milk will not save a chick that has been chilled, but a chick that is both warmed and buttermilk fed is as safe as any chick can be.

More important than buttermilk in the daily ration of the chick is green feed, for this is its natural ration. The chick in the days of the jungle fowl got no buttermilk, but it always got green feed. Chicks ought to have range. This is their normal condition. If range must be denied them more care must be exercised to make sure that they have all the greens they can eat. Lettuce is perhaps the best green for the new hatched chick, but the time soon comes when any green is welcome and useful. Cut alfalfa, chard, clover, and a little later on kale, lawn grass (cut fine), turnip leaves, chopped cabbage, anything goes with the little chick. Healthy development is not to be expected of chicks that are deprived of their proper allowance of green for the vitamines which are found in greens and fruit are necessary to the health of every living being. Just why this is so we do not know, but it is true. Our boys in France missed fruit more than any other of the accustomed foods of home, and the chick deprived of green misses it just as much.

Give Every Opportunity for Exercise

It is not necessary to enlarge on this point. Digestion depends on exercise, the amount of food consumed on ability to digest, growth on amount of food consumed. If the chick cannot have range give it something in its run to keep it interested and moving, but by all means give range if possible. Nothing quite takes its place.

THE BEST BREED

By Jean A. Koethen

Prolificacy is a matter of strain rather than breed. There are heavy laying strains in all breeds, and slacker strains in most of them.

In choosing a breed, the main point to consider is, what am I keeping hens for? If eggs and eggs alone are wanted, the White Leghorn is the egg breed par excellence. Commercial egg farms have found it the one breed that can be kept satisfactorily in large flocks, and the cheapest of all breeds to feed. For the back yard or farm flock the Ancona and Minorca will probably be found quite as productive, and the little Brown Leghorn recommends herself to anybody whose only aim is eggs.

Most farmers and backlotters, however, want both eggs and meat. For them, any one of the American breeds —Rhode Island Reds, Wyandottes and the different varieties of Rocks—will probably be more satisfactory, and the choice between these breeds is almost entirely one of strain. Some strains of Rocks are very fine producers. Some are too much given to broodiness. The same may be said of both Reds and Dottes. The main thing is, find a breeder who is breeding for eggs, not feathers, or for both eggs and feathers. Make him show you his egg records and then buy eggs, if you can afford them, from his best layers. If the pullets you get from such stock are not satisfactory, the only thing to do is to make them satisfactory by selecting the best layers and breeding from them. There is little use in hunting round for a more prolific breed. The men who build up bred-to-lay strains do it by breeding within their own flocks, mating their best layer to one of her sons, and their offspring to another son of a proven heavy layer.

If you prefer meat to eggs, try the Dark Cornish, one of the Orpingtons or the Light Brahma. They are all delicious for the table, and some strains are excellent layers, but all heavy breeds are inclined to put on fat to the detriment of egg production.

A good many people are asking about the Rhode Island Whites, and they are certainly making good as producers. Their table quality is about the same as that of the Reds.

The Time to Avoid Ignition Trouble is When You Buy Your Tractor

In the middle of the plowing season every moment lost through delays due to ignition trouble means a big money loss to you. You can avoid these costly delays by buying a K-W Magneto equipped tractor, as have thousands of other tractor owners.

Today 40 tractor manufacturers are using K-W Magnetos as standard equipment, because it is their guarantee to you of certain "no trouble" ignition.

These tractor manufacturers pay more for K-W Magnetos, because they know from experience that

TRADE K-W MARK High Tension MAGNETOS

Give reliable "no trouble" service—Fire any kind of fuel —Fire leaner mixtures—Insure easy starting, regardless of weather—Are protected against water, dirt and oil— Get full power out of every drop of fuel used.

In selecting a tractor look for the K-W trade mark on the magneto. It is your assurance of continuous "no trouble" ignition.

Write for a list of K-W equipped tractors. You will find among them the best in tractors, regardless of what kind of a tractor you need for your farm.

If you are not using a K-W now and want to get full power out of the cheapest grades of fuel, quick and easy starting and "no trouble" ignition, write us. We have a type that will interchange with your present system. In writing give name and model of your tractor.

THE TRADE K-W MARK IGNITION Co. 2895 Chester Av. CLEVELAND, OHIO, U.S.A.

Grow Wheat in Western Canada

One Crop Often Pays for the Land

Western Canada offers the greatest advantages to home seekers. Large profits are assured. You can buy on easy payment terms,

Fertile Land at $15 to $30 per Acre—

land similar to that which through many years has averaged from 20 to 45 bushels of wheat to the acre. Hundreds of cases are on record where in Western Canada a single crop has paid the cost of land and production. The Governments of the Dominion and Provinces of Manitoba, Saskatchewan and Alberta want the farmer to prosper, and extend every possible encouragement and help to

Grain Growing and Stock Raising.

Though Western Canada offers land at such low figures, the high prices of grain, cattle, sheep and hogs will remain.

Loans for the purchase of stock may be had at low interest; there are good shipping facilities; best of markets; free schools; churches; splendid climate; low taxation (none on improvements).

For particulars as to location of lands for sale, maps, illustrated literature, reduced railway rates, etc., apply to Supt. of Immigration, Ottawa, Can., or

GILBERT ROCHE,
3-5 First St., Sheldon Block, San Francisco, California.
Canadian Government Agent.

HOLSTEINS AT AUCTION

On Saturday, April 26th, Napa State Hospital, Napa, Cal., will sell from its noted herd of grade Holsteins 20 fresh and springing cows; 50 bred heifers, about 20 of them springers; 30 unbred heifers. The 117 milking females in the herd, including many 2-year-olds with first calf, averaged 11,503.6 lbs. milk last year. Some of these cows, and daughters of the best cows in the herd, bred to the great Napa State Hospital herd bulls, including a son of the world's record cow, Raphaella Johanna Aaggie 3d, will be sold. Registered sires used in the herd for the past 14 years; herd tuberculin tested for ten years. Eight choice registered Holstein bulls will also be sold, out of dams with official records up to over 29 lbs. butter in 7 days. Everything over 6 months of age tuberculin tested. Sales manager, C. L. Hughes, Sacramento; auctioneer, Col. Ben A. Rhoades, Los Angeles.

We have one or two Guernsey bull calves left old enough for service and several youngsters. All out of A. R. cows with big records and sired by the best blood in the country. You need a Guernsey bull to put color, flavor and butter fat in your milk. Herd free of tuberculosis by state test. Write for full information. Elliott-Brant Rancho, Owensmouth, California.

SHORTHORN CATTLE, SHROPSHIRE SHEEP. Berkshire Hogs and Shetland Ponies. Get our prices and descriptions before buying. Butte City Ranch, Box C, Butte City, Glenn Co., California. W. P. Dwyer and W. S. Guilford, Owners.

Jersey Bulls—Type and production, easy terms. N. H. Locke Co., Lockeford, California.

Registered Shorthorns — A few choice young bulls, grandsons of Fair Knight. Prices reasonable. Fair Oaks Ranch, Willits, California.

A HOME LIGHT SHINING

From far along the country road I see a
star of light;
A faint, wee gleam from out the gloom
and mystery of night.
To me, it means a world of things—a
hearthstone and a kiss;
A rest-place that is mighty fine in work-
a-days like this.
I know that loving arms are wide—that
children wait for me,
That I will have them all around and
climbin' on my knee.
A gleam of light against the dark,
The home-torch of the heart.
And heaven must have lit th' spark
That plays so sweet a part.

One window, gleaming in the night, and
yet its yellow glare
Can speak a language of its own; of dear
ones waiting there.
I grow to look for it—and stop—a mo-
ment, then speed on,
What sudden heart-ache if it failed—I
looked, and it was gone.
No light-house on a rock-ribbed coast
could play a nobler part,
The dear home star that lights a path of
gladness to the heart.
A farm, half-hidden in the hills,
The acreage of thrift,
But it's the love in them that thrills
And makes the precious gift.

—W. Livingtone Larned, in Hoard's Dairman.

THE STATION MADONNA

AS THE TRAIN moved out of the brilliantly lighted station into the starlit darkness of the winter evening, Ellinor Davenport leaned back in her seat and closed her eyes.

"At last, I can think it out," she said with a sigh of relief.

She had the sensation of having hurried breathlessly; yet, as a matter of fact she had received the telegram with at least outward calmness, her preparations for leaving home had been made rapidly but methodically, and she had entered the station in ample time. The tumult had been within.

Was it only three hours ago that she had been reading her paper before the members of the Monday Club in Mrs. Barton Thornaby's white and gold parlor? How much she had put into that paper! It held the cream of her thinking, of her living, for the last five years. "The Obligation of Personality" was the subject, for she had been assigned to the division of ethics in the club's work. Last year she had been in the household art division and many had spoken admiringly of the careful and exact knowledge displayed in her paper on ceramics and she had been gratified by their praise, but this was different. She had put her best into this paper and its reception had moved her deeply. She seemed even now to see the earnest faces turned toward hers, and one passage still seemed echoing in her ears: "As women we have been too ready to let others assign to us our part in life, too ready to take up the burdens that others are thoughtlessly willing to place upon our shoulders. Our lives are in our hands to shape and mold, and to our own souls we must answer if we allow ourselves to be cheated of our heritage and our days and years filled with irrelevant things."

"Let me congratulate you, Mrs. Davenport," Mrs. Barton Thornaby had said to her as she was leaving, "not only upon your admirable paper, but upon the growth which it attests. If we are not careful, you will outstrip us all in the spiritual race."

Mrs. Thornaby was both a social and an intellectual queen and praise from her was sweet. And then she had been driven home and the maid had met her at the door with the telegram.

"The boy left it not ten minutes ago, ma'am."

She had opened it unhesitatingly. No doubt it was from her husband to say that he would be unable to reach home that evening, but instead she read,

"Mabel is dying. Can you come? Tom."

Tom was her only brother and Mabel was his wife. She had never been strong and for the last year had been an invalid, but it was a shock to learn that she was dying. Closely following upon the shock, she had been conscious of a feeling of irritation, and even before she had laid the slip of yellow paper down she had said to herself,

"Tom will ask me to take Marjory."

All the while that she was preparing for her journey, she was conducting an inner argument with Tom. She had felt it a relief that her husband was out of the city, for she knew instinctively that he would side with Tom. And now that she was on her way, the necessity for action gone, the tumult within seemed to increase though she was conscious all the while of its unseemliness. But why should she, she asked herself, why should she take Marjory, a two year old baby who would interrupt all her pursuits, interfere with all her plans, turn her life upside down? Tom had no right to ask it. Why had Tom married Mabel? She had never approved of the marriage, never been really reconciled to it. It had been but the confirmation of her foresight when Mabel had proved sickly and inefficient, a hindrance to Tom financially, socially, every way. And now it was in keeping with all the rest that Mabel was going to die and shift her responsibilities onto others. Well, at all events, she would not be the victim. She would be true to herself, cost what it might, for she knew that it would not be easy for her to resist Tom.

She looked out into the fast deepening darkness. Now they were nearing a town and numbers of little houses went scurrying past, the lamps that were lighted within giving her glimpses of the occupants. At the open door of a comfortable looking farm house, a little girl and boy stood waving energetically at the passing train. It made her think of herself and Tom when she was curly haired little Nell Hunt, years ago—Ah, how long ago it seemed—and Tom her constant playfellow and companion. They had lived in just such a white farm house, and after the new railroad had been built through the south pasture, how often they had stood on the porch and waved at the trains. As she grew older, how she had dreamed and romanced about the people who rode on the trains. Now she was one of those people and little Nell Hunt had faded into the past! Well, one could not be a child always. She was glad that she had had such a happy childhood, but she was not dissatisfied with her present life. She had had some sore trials and the glamor, of course, was gone, but she had a good husband, a pretty home, a comfortable income, and a congenial social life, so what more could she ask? If her baby had lived—but the sharpness of that sorrow was past and she had grown used to her empty house—ah, how empty it had seemed at first. It was with the idea of forgetting this great sorrow that she had plunged into study and unceasing activity in her clubs, and now this new order had come to mean her life and happiness, so she thought.

"No," she told the porter, she did not care for dinner, but she was tired and he might make up her berth at once. But when her preparations for the night were completed and she had lain down, she found she could not sleep. Thinking of her childhood had brought thoughts of her mother. What a dear mother she had been! Picture after picture came up from the past. How many little school day pleasures had been planned and made possible through her mother's self-sacrificing love. Then she remembered her mother's face on the day that she was married, and next she seemed to feel the pressure of her mother's arms the day her baby died.

"O, Mother," she whispered with a sob, "it's ten years but I miss you yet!"

Poor Tom, he would not have his mother to comfort him in his sorrow. Whatever faults she had found in Mabel, Tom had never seemed to find any and he was such a warm hearted, affectionate fellow, it was going to be hard on him. And how unkind, how unsisterly she would seem to him when she refused to take Marjory.

At last she fell into a troubled sleep, and in her dreams, Tom and Mabel and Marjory, her mother, and even her own little baby seemed to come and look at her reproachfully.

"But don't you see," she tried eagerly to explain, "it is not that I am selfish, but I must be true to myself; I have my own life to live; I can not

The Cultivator Patterns

8740—Ladies' Kimona Blouse. Cut in sizes 36, 40 and 44 inches bust measure. The blouse is to be slipped on over the head and is open at the sides as far as the waistline.

8489—Children's Empire Dress. Cut in sizes 4, 6, 8 and 10 years. The dress has a straight, one-piece skirt gathered to the Empire waistline.

8238—Ladies' Bungalow Apron. Cut in sizes 36, 38, 40, 42 and 44 inches bust measure. The apron fastens down the center back and has the Dutch neck outline.

8543—Ladies' Waist. Cut in sizes 34, 36, 38, 40, 42 and 44 inches bust measure. The back extends over the shoulders and the fronts are gathered to the edges to give the effect of a shallow yoke.

8492—Girls' One Piece Dress. Cut in sizes 8, 10, 12 and 14 years. The inset vest is rolled to form reveres to which the big sailor collar is attached. The dress closes at center back.

8765—Misses' or Small Women's Dress. Cut in sizes 16, 18 and 20 years. The two-gored skirt is gathered all around to the slightly raised waistline, and a roll collar finishes the neck of the waist.

8729—Ladies' Two Gored Skirt. Cut in sizes 24, 26, 28, 30 and 32 inches waist measure. The two gored skirt is gathered at the sides and back to the slightly raised waistline.

PRICE OF ANY OF THE ABOVE PATTERNS 10 CENTS EACH.

HOW TO ORDER PATTERNS

Write your name and address plainly in full, give correct number and size of each pattern you want, and send 10 cents in coin or (1 or 2 cent) stamps for each number. In order to furnish our readers with the very latest New York City styles, all pattern orders are filled in New York City. Therefore, we promise to deliver all patterns ordered within two weeks we guarantee safe delivery of all patterns. Address

urn aside just to gratify Tom." Still those reproachful looks were bent upon her, and it was a relief when she awoke. She drew aside the curtain and looked out into the gray of early dawn. The train was standing still; they were probably taking water for the town was a mere handful of houses and there were no passengers coming or going. Ellinor's window was directly opposite the little station house. The waiting room was closed and empty, but at the other end of the building a door stood partly open and she could see that the room contained a bed and other articles of household furniture. No doubt the station master had his home there. Presently a tall, dark haired woman came and stood in the doorway. She held a baby in her arms who looked with grave eyed wonder at the train. The mother had thrown a long, dark red scarf over her head and the ends were wrapped about the child. Her face and figure had at once the roundness of youth and the firmness of maturity and over her face there brooded the mystic beauty of motherhood.

Ellinor drew in her breath.

"Ah," she said softly, "how lovely! The Madonna!"

As the train moved on, she began to weep, but she knew that her struggle was over. The old ideal with which she had all through the night been wrestling, had in the gray of the morning embodied itself before her eyes, and her resistance vanished.

It was the day before Christmas, a sparkling winter day, that Ellinor made the return journey and the train stopped for a moment at the little station early in the afternoon.

"See, Marjory," said Ellinor, holding the child to the window, "a dear little baby lives in that house."

And once more the mother came and stood in the doorway, with her baby in her arms, and, for a momen,t as the wheels began to turn slowly, the two women looked into each other's eyes and smiled.

USE MORE BEANS

While looking over your recipes and other information this week I came across an economical recipe for soup and some other articles of diet. Now in my humble opinion the writer lost sight of the nutritive values in her over zealousness for economy. Her soup, which should be liquid nourishment, has very little of such value in its composition, the few bread crumbs and the piece of bacon rind making the only thing representing food value.

Now as beans are cheaper than water at present I would say to add a few beans instead of so much water. She has all the seasoning and tastiness necessary. Now I would like to send a recipe for cooking Tepary beans.

How to Cook Tepary Beans

Place beans on the stove in boiling water instead of cold water and for each three teacups of raw beans use a level teaspoon of baking soda. Do not salt until done or add bacon until commencing to soften as salt has a tendency to harden all beans. If directions are followed they will cook in one and a quarter to one and a half hours. If slight sweetish taste is objected to, when they first commence to bubble pour off water and add more. When cooking, cook enough for two meals and next day place the beans in a flat pan and put in a small thin slice of fat bacon (economy squares) for each member of the family and place the pan in the oven and bake for 20 minutes or a half hour and you have a delicious, tasty, economical, highly nutritious meal. According to the University of California the Tepary is slightly more nutritious and more easily digested by children on account of the thinness of the skin.

Tepary Soup

Take left-over Teparys and mash them through a colander, put in two or three tomatoes, a little cabbage (left over or raw) and an onion all cut fine, boil until tender, add seasoning to taste and a quarter teaspoon of chili powder to each quart of soup. Add milk or not as desired and you have a healthful, filling soup that will tempt anybody just to sniff the odor from the cooking.

To Use Surplus Grapes

There are several tons go to waste every year here after the pickers are through, so last fall I tried canning some for pies. I found by crushing them to start the juice and cooking in their own juice they needed no sugar as they are almost too sweet. Cooking a half hour they are much superior to raisins for pies and greatly relished by our family for sauce on the table. These were Muscat grapes but I suppose any other fully ripe grapes would do.—Mrs. V. N., Wineville.

HOUSEHOLD QUERIES

How Can I Use Cull Lemons?

Will some one kindly tell me what can be done with lemons? We sell all our best, and I find over a barrel of fine lemons with no use. Can any one suggest anything? My family won't eat another lemon pie or drink any more lemonade. Also will some one please tell me how to make pie crust? Don't say a half cup full but tell me in tablespoonfuls and if heaping or flat.—A Very Young Wife.

If you are tired of lemon pie and lemonade why not use your lemons to save soap? There is no luxury equal to a hot bath with one, two or more lemons, cut in halves, squeezed and left floating in the tub. The juice softens the water, making soap unnecessary. The oil in the rinds also is a skin softener. The soaked lemon halves turned wrong side out are the finest kind of bath scrubs. After such a bath you have the "velvet skin," "the skin you love to touch" described in costly advertisements of costly toilet preparations. Of course you use lemon juice to give your hair a lemon wrinse. I have a friend who uses lemons only for washing dishes—no soap. She scrapes her dishes clean and uses plenty of hot water. It's good for her hands as well as the dishes.

Have any Cultivator readers other suggestions?

Easy Pie Crust

Here is a recipe for crust for one pie. It is easy to remember, in fact it is called the "One, Two, Three Pie." One cup flour (one cup equals 16 level tablespoons or one-half pint), two level tablespoons shortening, three level tablespoons water, pinch salt (salt varies so much in saltiness that the cook must taste and try), pinch baking powder if raised crust is desired (pinch here means less than one-fourth teaspoon).

Sift flour, salt and baking powder into chopping bowl. Flour blade of chopping knif and chop in shortening (lard, butter, suet or commercial compound) into the flour, being careful to keep flour between blade of knife and shortening as much as possible. When the mixture looks like meal, each little particle of fat being coated with flour, add gradually the cold water, mixing with case knife to make a stiff paste that will stick together without adhering to sides of bowl or knife. Roll into ball with the knife, turn on board lightly dusted with flour, roll about in flour with the knife, then pat with rolling pin into rectangular shape and roll out to thickness required. Dust board with flour when necessary but use as little as possible.

How to Cook Windsor Beans

I am trying to raise Broad Windsor beans for the first time and would like to know what they are good for. The seeds are so different from any other beans that I ever saw that I am puzzled to know how to cook them.—A Reader, Ojai.

These beans are cooked either as green beans or dry. For cooking green, pick pods when they are not more than six inches long. To avoid their turning an ugly color in boiling they should be sliced thin into a bowl of cold water, and whenever the knife used shows any stain it should be wiped clean. Throw off the water in which the pods have been sliced, put into fresh cold water and let stand for about ten minutes. Again put on fresh water with a pinch of soda added and put on to boil. They should not boil for more than three to five minutes. Also they may be cooked shelled like green Limas.

They are also good cooked as dry beans, though the skin is rather tough. Put beans in cold water with about half a teaspoon of soda to enough beans for four people. As soon as they begin to boil, remove from the soda water in strainer, dipping immediately into cold water. The skins then can be easily rubbed off. Put back into the soda water and boil until cooked.

Let Your Children Learn on a Good Piano

A poor piano has no musical quality of tone. This lack of tone quality is a serious menace to the "ear." Also in a poor piano the action is hard and irregular and the fingers and hands are improperly trained. Therefore if you intend to have your children learn to play, provide them with a good Piano. Consider quality and not cheapness—a good reliable dealer has good Pianos at moderate (not cheap) prices.

We invite you to call at any of our stores—or write us asking for illustrated catalog and prices.

We are dealers in Steinway and other Pianos, Pianola Pianos, Aeolian Player Pianos, Player Music, etc.

Belgian hares 17.

LIVE STOCK

By F. P. Allen, Bureau of Markets, Los Angeles

The local market for cows of all grades is in much healthier condition than the steer market. The cow market is firm while the steer market is only steady. Some cattle feeders in this locality who have steers ready for market claim that Los Angeles slaughterers will not bid on their steers, giving various and sundry excuses for their action. It does seem to be difficult to market steers in this city, and local cattle feeders do not care to suffer the punishment that local dealers will mete out to them if they ship their stock to other markets: hence the situation is not the best. Hogs continue very scarce. The market is very strong even for the hogs that now comprise the receipts which are below the normal standard of quality.

Lambs that are not heavy are steady. Spring lambs are firm.

Light ewes are firm under moderate receipts. Heavy ewes are weak.

The following prices for classes and grades of live stock represent those being paid by local killers f. o. b. Los Angeles County point prices are usually $1.00 to $1.50 less than these figures dependent upon the distance from this city.

Good steers .....13.50@14.50
Medium steers .....11.00@12.00
Common steers .....9.50@10.50
Good cows .....11.00@12.00
Medium cows .....9.00@10.50
Common cows .....6.00@7.50
Hogs No. 1, 175-225 lb. .....17.50@18.00
Hogs No. 2, 250-400 lb. .....16.50@17.00
Feeder hogs .....14.00@14.50

Above prices are for grain fed hogs in carload lots, f. o. b. Los Angeles.

Lambs No. 1, 55-70 lb. .....16.50@17.00
Lambs No. 2, 65-80 lb. .....15.00@15.50
Wethers No. 1, ...11.00@12.50
Ewes No. 1 .....9.00@10.50

POTATOES AND ONIONS

These are the actual prices obtained March 24 by Los Angeles wholesalers in in their sales to retailers, peddlers, hotels, restaurants, cafeterias, etc. Terms cash on walk.
on walk.

Demand and movement good. Prices slightly higher. Squash—Hubbard, best, lb. .....2½@
Tomatoes, Mexico, condition generally good; best, 2.75@3.00 lug bx.
Turnips, doz. .....

FRUITS

These are the actual prices obtained March 24 by Los Angeles wholesalers in their sales to retailers, peddlers, hotels restaurants, cafeterias, etc. Terms Cash on the walk.

Apples: Yellow Newtowns, fy. medium size 3.00@3.50; loose 7 lb. Oak Glen Rome Beauties and Pearmains, 3.00@3.75; Winesaps, 3.75@4.00; Yucaipa, Delicious, fy. large size, 3.00@3.50.

Pears: Winter Nellis, lb., 6@7.

Lemons: Fy. packed, 4.00@4.25; local pack, 3.50@4.00; loose, some tree ripe 1.75@2.00.

Oranges: Navels, medium and large size, fy., 4.25@4.75; local packed, 3.00@4.00; Tangerines, 6@7 lb.

Grapefruit: Local fy., 2.50@3.00 bx. Imperial Valley, 3.00@3.25; Tulare County, 2.75@3.00.

HONEY

Demand improving account of the increasing export demand. Little change in prices, remaining supplies very light. Carloads f. o. b. usual terms, California extracted light amber sage, 17½@18 lb. light amber alfalfa, 15½ lb.; Idaho extracted white alfalfa, no sales reported asking 18 lb.

BEANS

Demand slow, little change in prices, market somewhat unsettled account of growers forming a pool to stabilize prices. Warehouse cash to growers, choice recleaned sacked per 100 pounds: Limas 6.50@6.75; Henderson Bush 5.25@5.50; Small Whites strictly undamaged 5.50@5.75; Yarge Whites strictly undamaged 5.75@6.00; Blackeyes 3.00@3.25; Tepary, no sales reported. Trade is practically at a standstill in eastern producing sections, a better tone prevails in Southern California, where sacked recleaned Limas advanced to 6.75 to growers. This same stock was stronger in terminal markets at 7.50@8.35. Sacked Michigan and New York pea beans were about steady in Eastern jobbing markets at 7.00@7.75. Shipments were below the recent average.

GRAIN AND FEEDS

MOHAWK TIRES *and* CONCRETE ROADS

You will find Mohawks excellent tires on concrete roads—better capable of withstanding their frictional and abrasive action. In slippery weather Mohawk treads give your car a good behavior and yourself a secure feeling, essential to your enjoyment and safety.

You are not going to drive on concrete roads all of the time, of course. In fact, we have built Mohawk Tires on the assumption that their users are not fair weather, good road drivers.

Therefore, when you turn off on a bad road, you'll find Mohawks still capable of standing the grind.

Out of the thousands of owners who have bought Mohawk Tires our dealers' records show that 85% have become so attached to Mohawks for these reasons, that they use no other tire. Such owner confidence is worth remembering.

And even with these facts we do not claim for Mohawk Tires anything that any other tire maker, possessed of the same knowledge and skill, might not claim if he used our methods.

For example, we buy only the highest quality, purest and toughest materials the markets offer. We off-set this extra cost of producing Mohawks by operating our plant without financial encumberance of any kind—no watered, inflated stock or bonds. A reasonable return is enough, allowing us to continually maintain our quality.

When you need a new tire you can buy one that actually represents more value for your money if you buy a hand-made extra ply Mohawk.

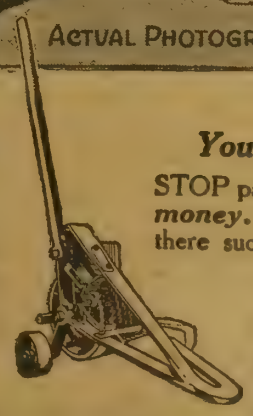
Good Dealers Everywhere Handle Them

MOHAWK RUBBER COMPANY
AKRON, OHIO
Branches at:
New York Boston Chicago Atlanta Kansas City San Francisco

A GOOD ROAD
—Saves wear and tear on tires.
—saves depreciation on automobiles, wagons, farm machinery.
—saves oil and fuel
—saves time and money, for a good road allows you to get to your destination on time, no matter what the weather or what the season of the year. Perishable produce never spoils in those localities where there are good roads to the nearest town or railroad station. Mohawk tires give an unusual mileage on any road—but the better the road, the longer they serve, naturally.
Are you doing all you can to boost good roads?

MOHAWK "Quality" TIRES

Are You Paying Taxes On Your Stump Land?
Clear It and Make Money.



Increase your acreage and you will increase your bank account

Clear your stump land cheaply no expense for teams or powder

ONE man with a "K" can outpull 16 horses. Works by leverage—same principle as a jack. 100 lbs. pull on the lever gives a 48 ton pull on the stump. Made of the finest steel—guaranteed against breakage. Works equally well on hillsides and marshes where horses cannot operate. Endorsed by U. S. Government experts.

Write today for special offer and free booklet on Land Clearing

WALTER J. FITZPATRICK
Box 17 182 Fifth St., San Francisco, Cal.

Your opportunity is here to-day

STOP paying taxes on your stump land turn it into *money.* Never in the history of the World was there such a demand for the product of the soil.

HAND POWER
K Stump Puller

Man or woman single handed can pull from 50 to 150 stumps a day. Weight without cable 171 pounds. NO STUMP TOO BIG.

'Chain' *'Usco'*

Make Your Car Help

America is asking for a Victory Harvest this year.

Every country's short of everything. You never had such an eager market. Every additional bushel you can make your fields produce means just that much more in the bank for you.

Make your car help. Think of the time, energy and good, hard cash it will save for you! Think of the speed it will put into those trips to town.

Its dependable service means a lot to you.

And there's no such thing unless you give it good tires to travel on.

There's a United States Sales and Service Depot dealer in the nearest town. He will gladly point out the United States Tires that will meet your requirements to perfection.

For the line of United States Tires includes tires to meet any possible need.

There are five different types for passenger cars as well as both pneumatic and solid tires for trucks.

They're all good tires—the best our seventy-six years in the rubber business have taught us to make.

Once you discover what they mean to your car—their wonderful dependability, their real goodness—you'll stick to United States Tires just as tens of thousands of other farmers are doing right now.

Try it and see. Ask our Sales and Service Depot to help you.

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertisers in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

THIS WEEK'S COVER

California again bobs up with its greatest ever. That Guaranty Sale, with the guaranties that the buyers knew meant just what they said, surely acquitted itself in true California style. It was one great sale, and one of the great animals, which commanded $5000 at this sale, is illustrated on the cover page of this issue. His name is King Abbekerk Johanna Segis, and he is declared to be worthy of the legend: "Highest record bull on the Pacific Coast." He was consigned by the Bridgfords of this state and purchased by the Mitchells, also of this state. The transfer will be from the Sacramento to the San Joaquin Valley. He boasts a long line of great ancestors and his dam is in the "over-41-pound-class." Later we will give the photograph of the cow which commanded $4000 at this same sale.

GOVERNOR WITHYCOMBE

In the death of James Withycombe, governor of Oregon, the farmers of that state lost their best friend. He was himself a farmer and spent his life advancing the interests of the farming class.

IN SMALLER PARCELS

One of the greater lemon producing properties of California has been the Leffingwell Ranch at Whittier. Established more than a score of years ago, it has made a continuously increasing shipment of lemons and walnuts. A spur from the railway has been built in and great packing houses and store rooms have been built. There are several hundred acres in the place and almost every one of them producing to the limit. This property is now to be broken up into smaller parcels, and while many will learn with regret that such a magnificent place is to be broken into small parcels, the fact is that it will afford sites for a great number of California homes.

COOPERATIVE LAUNDRIES

The "Show Me" state is showing rural residents in other states. In one neighborhood a home maker found it impossible to continue doing her own laundry work and organized her neighbors. They made a bargain with a large laundry to do flat and rough dry work at a low price provided patrons would do their own delivery. Twelve families united in the plan and more reasonable prices were secured by all.

Still better, may not our community organizations have their own laundries and possibly have the advantage of still lower prices and laundry work free from the use of destroying chemicals.

PURE FEEDS

Users of purchased feeds in large quantity are generally experienced and buy only the better grades of standard feeding stuffs at close prices, or secure such materials as screenings, etc., at low prices, fully understanding their composition and relative value. The small buyer, often feeling the pinch of poverty, too frequently is looking for something that sells for less than is demanded for standard goods, and so is the more easily caught by the low-grade, trashy articles often bearing catchy, high-sounding names. Low-grade feeding stuffs, no matter what their names, are almost sure to bring hardship to the animals that are fed on them, and to the owners of such animals as well. Such feeds are really more like roughage than concentrates and roughage can be produced on most farms far more economically than it can be purchased in bags from the feed dealers. Wherever one is in doubt as to what to buy, he should consult the feed control officials of his state or purchase only the pure unmixed grains, straight milling or factory by-products, or proprietary feeds of high grade that have won a good reputation.

The above is from "Feeds and Feeding" by Henry and Morrison and in these few words presents an exceptionally strong argument for the passage of the pure feed bill known as Senate Bill 93 with the Cummings Assembly amendment. Every senator and assemblyman who desires the welfare of the state will vote for this measure. Let Cultivator subscribers call their attention to the necessity for its passage.

SAVE AN INDUSTRY

The output of the California dairy industry is decreasing. The 1917 output of butter was 68,373,021 pounds, that of 1918 was practically 8,000,000 pounds less, or, to be exact, 60,358,595 pounds. These figures are from the report of the state dairy bureau for 1917-18. The report also contains the statement that near Conejo in Fresno County one of the inspectors of the state bureau reported 12 places where dairies have been entirely discontinued. On these places from ten to 30 cows have been milked. Asked for the reason for their discontinuing the dairy business the usual reply was in effect; "High priced wages and feeds." Still worse, some feeders have found such indifferent results from feed for which long prices have been paid that they are absolutely discouraged. Hence the pure feed bill which has been introduced into the state legislature.

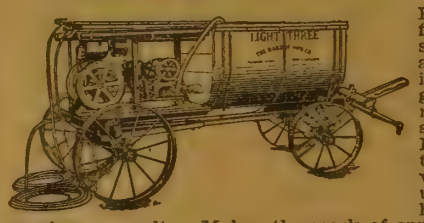
With orchardists leading in the campaign for dependable fertilizers the state some years ago was given a fertilizer law which assures the purchaser that he is securing what he is paying for, or at least that he is informed as to what he is securing. Feeds for humans likewise have been protected by state and nation, but concentrates, or the higher priced animal feeds, have no protection whatever, other than that secured by shrewd buyers of large quantities who may make analysis. Fortunately that class of buyers is still able to care for itself, but a great number of less fortunate feeders, compelled by circumstances to buy the very cheapest, are sometimes permitted to purchase feeds of practically no nutritive value.

We have known of one case of an interstate shipment labeled "Mixed Wheat Middlings from Pure Wheat Bran and Ground Corn." The department of agriculture examined this shipment and found that the wheat middlings consisted only of bran and that the ground corn was only ground corn cobs. Another shipment examined by Woll and Olsen, both at that time connected with the Wisconsin agricultural experiment station, was a car of so-called wheat bran, and regarding this "bran" the statement was made. "Each pound of the whole carload contained an average of 28,000 pigeon grass seed, 16,000 wild buck wheat seed, 5000 pig weed seed and many seeds of other kinds."

While we may be permitted to assume that California has no feed dealers who would countenance such transactions, yet for some reason there are some who are opposing the passage of a pure feed bill in the state legislature. It had been supposed that this bill would become a law with scarcely any opposition. It provides that where "fillers" are used in the making of stock feeds they shall be particularly specified in a statement attached to the container. It is known that millers have used corn cobs, corn bran, oat, barley and rice hulls, alfalfa meal, and similar materials as fillers. While corn cobs and grain hulls and similar material contain practically no nutrition, millers who have advocated their continued use in concentrates claim that they fill the place of roughage and aid in digestion. But here the dairymen or live stock man insists that roughage is his cheapest feed and it is sometimes a problem for him to dispose of all the roughage he has and he does not wish to pay for more roughage at the price of high priced concentrates and pay high freight rates on it in addition.

Reputable millers and live stock people are uniting in securing the passage of the bill, but the opposition is becoming emphatic in demanding its defeat or that its usefulness be destroyed by amendments which practically nullify it.

It is time for the friends of dairy production in this state to urge upon every assemblyman and senator in the state that he look to the state's welfare and pass the Higdon Senate bill or with the Cummings amendment as recommended in the senate bill.



WIRE FROM SACRAMENTO

Suggest making strong story this week's issue supporting Senate Bill 93 in form it came from assembly committee on live stock and dairies, because strong lobby making eleventh hour attack. One lobbyist boasts he has votes to kill bill unless live stock and poultry interests yield to form in which it passed senate with teeth extracted. Obnoxious part to interests is stating specific name of each ingredient used and percentage of such ingredients as corn cobs, corn bran, oat, barley and rice hulls, ground light rice, alfalfa meal or similar materials regarded by feeders as "fillers". In case of poultry feeds percentage of grit or mineral matter is obnoxious to mixers but favored by feeders. Assemblyman Cummings put these features back into bill and refuses to yield. Senator Higdon says he wants Cummings' amendments as it gives live stock and poultry interests kind of bill they want.

Request readers bombard legislators to stand for bill as it came from assembly committee and vote down amendments destroying efficiency of measure. Quick action.—Frank B. Anderson.

18 Years Back of Hardie Sprayers

High Pressure, Light Weight, Large Capacity, Powerful Engine, Perfect Agitation, Simple Construction.

HARDIE POWER SPRAYERS are the final word in sprayers. They represent not only years of experience, but also an accurate knowledge of spraying needs and the conditions that govern spraying. Where spraying is most difficult you will find HARDIE sprayers in the majority.
HARDIE SPRAYERS are noted for their simplicity. No complicated devices to cause trouble when every minute counts. You can put any of the help to work with a HARDIE and get maximum results. Makes the work of spraying easier than ever before.

When you see a HARDIE SPRAYER you will readily understand its superiority. See how compact it is—the few working parts and how everyone of them is quickly accessible. There are 21 HARDIE features that make it the leading power sprayer. The HARDIE CATALOG tells all about them. A COPY is yours for the asking. Send today. You can see a HARDIE at your dealer's.

Hardie Orchard Gun $12.00

The latest HARDIE device made to improve spraying conditions, shoots a cloud of penetrating spray, covers the trees with a fog. Easy to handle. Takes a tiresome load off the arms and does the work in much less time. Fits any high pressure sprayer and increases its efficiency.

Order a Hardie ORCHARD GUN from your dealer or direct from us. Money back if not satisfactory.

The Hardie Manufacturing Company
Office: 1023 Leighton Ave. Los Angeles

Hardie Agent: H. V. Carter Motor Co., San Francisco
Hardie Agent: A. F. George Co., Los Angeles

A Tale of Two Tractors

By James De Camp

BURKE sells the ——— Tractor. Six months ago he placed machines with Smith and Jones, owners of adjoining ranches about 60 miles down the valley.

Last week Burke dictated a courteous letter to each of his patrons asking for a candid criticism of his product. He said in part: "I am not fishing for testimonials. My purpose in making this inquiry is to find how the ——— Tractor is standing up under the demands made upon it by conditions here in the valley."

Smith replied: "Your machine meets with my unqualified approval. I report with pleasure that it has displaced three teams and I have been able to get along without hiring anyone in the place of Pete, who was drafted and is now in France. The tractor has been worked almost daily since its purchase and for three weeks during the busy season we ran straight through until midnight."

Here is Jones' answer: "I have been waiting for some time and am glad of this opportunity to tell you that your tractor is a bunch of junk. It has been out of fix for nearly three weeks steady now and never gave satisfactory work. It lacks power and does not plow or cultivate deep. I am going back to horses. If anyone is looking for one of your contraptions second hand and has the patience to fool along with this one send them down."

Next morning Jim Simpson dropped into Burke's salesroom. Simpson circulates about selling celluloid collars, lanterns, lightning rods, thread and a whole alphabet of knick-knacks. His cruising radius is about 150 miles, with Willowdale as its center. He knows every man, woman, child, mule and tractor in the district. Burke spread the two letters before him.

Simpson tilted back his derby and grinned.

"There's the answer right before you," he said. "Look at the two letters. Smith's is typewritten on his own letterhead. The paper is not high-grade nor the typewriter new, but the whole thing is neat and businesslike. Jones has used a pencil, misspelled a half dozen words and scribbled on a fly-leaf torn from some catalogue.

"The tractor isn't made that could get along with Jones. I happened down his way about two weeks after he bought the thing. He was ripping up the south meadow with the throttle wide open and the plows slipping along behind rigged up so that they did little more than scratch the ground.

"I flagged him and inquired how long it was since he had decided to put Barney Oldfield out of biz in the speed line. He commenced right away kicking about the tractor.

"'What you burning in it?' I asked, holding my nose. 'It smells like a limburger factory.'

"'Well,' he says, 'the agent told me it was best to use gas. He said I could get along with distillate on a pinch, but I've found that by jimmying around with the carburetor I can use a mixture of distillate and tops. Just makes it kinda' hard to get started, that's all. Most of the boys around here are working their heads off to pay for their high-grade fuel, but I've got the drop on the whole bunch.'

"'Yes,' I told him, 'but you'll probably have to buy a new tractor before the others even run up a repair bill. The fellow that made this sputter-wagon knew just what it needed in its little tummy to make it feel right and step lively. You've only had it a couple of weeks now and it sounds like a bunch of Bolsheviki wrecking a boiler factory.'

"He swallowed that and then stepped around to the off-side and raised the hood. 'Say, Simpson,' he says, 'do you know what these peculiar little brass cups in here is for?'

"I felt like telling him that they were for straining soup, but I explained the function of the priming cups and ended up by asking him why he didn't sit down on the stoop some quiet Sunday afternoon and read his instruction book through.

"'Well,' he says, 'there was some kind of a book in the tool box, but I figgered this theory stuff is all bunk. I let the kids have the book to play with. It's probably burnt up by now. But I sure will try them priming cups. Some days I have had to let her stand until noon before I could get her started.'

"I drove on to Smith's place to spend the night. When I got there Smith was out in the barn fussing over his tractor with an oil can. Mister Rockefeller doesn't keep his limousine in any better shape than Smith does that outfit of his. He told me that he had disked ten acres during the day and would not go back to horses and hay if presented gratis with the 12 best teams in the state. Smith burns distillate, but he had a special carburetor installed and starts on gas from a little priming tank he rigged up himself. He said that he had never had a bit of trouble and always read the instruction book or called in a mechanic when anything came up that he did not understand.

"Smith said that his prospects for a bumper crop were the best in ten years and that the tractor had enabled him to cultivate a neat plot of land that had been set aside for pasturage heretofore. He also showed me how he rigged up a belt connection to run his ensilage cutter, separator, woodsaw and other pieces of farm machinery.

"That night we had a right smart storm and it still looked nasty when I drove back past Jones' place in the morning. There stood his tractor in the middle of the field, just where he had left it when he quit work the night before. He was fussing around trying to get the thing started. I stepped on the throttle and looked the other way—"

"Wait a minute, here's the postman," Burke interrupted.

Burke ripped open the top letter. A grin rippled over his face and developed into a healthy, tooth-paste-advertisement smile.

"What's the matter?" asked Simpson. "Rich uncle die, or somethin'."

"No," Burke answered. "This is from Smith. He is ordering two more tractors and tells me that he has been forced to foreclose on our friend Jones and take over his place. Jones is going back to Los Angeles to work by the day."

Model D, Bates Steel Mule Tractor

A three and one-half foot cover crop being turned under with an eight foot disc harrow on ranch of W. H. Sievers, Placentia.

Guaranty Sale Establishes World Record

ALL Pacific Coast sale records were smashed when 61 head of Holstein bulls and females, many youngsters included, were sent through the Annual Guaranty Sale ring at Sacramento, Thursday, April 27, for a total of $63,775, an average of $1045. Not only was this sale a Coast record, but never before had a one-day sale of Holsteins averaged as much. Thus a world's record was hung up. Furthermore, only four sales of Holsteins have ever surpassed this mark.

The success of the sale was due primarily to the extreme quality of cattle contributed by the leading herds of Washington and California, but much credit must be given to the careful and efficient management accorded the event by C. L. Hughes, sales manager of the California Breeders' Sales and Pedigree Co., and to Auctioneers Ben A. Rhoades and H. C. Cranke. Even more important than the above factors was the evident and willing determination of the buyers in attendance to own the cream of Western Holsteins.

The offering represented 14 of the top herds of Washington and California and it was absorbed by 27 buyers representing California, Washington and Nevada.

A feature of the sale was the number of new breeders participating and the unusual discrimination they displayed in making their selection.

Much interest had been aroused by the offering and there was much speculation as to the general average and the tops. For the most part the prices ruled about as was expected but in many cases, as usually happens, there were plenty of bargains.

The top of the sale was reached when W. F. Mitchell of Visalia made the bid of $5000 for the year old bull

History Makers

Three daughters of Prince Gelsche Walker, consigned by A. W. Morris & Sons and purchased by E. D. Barry, Jr., Daggett, for $4000. Reading from left to right: Dictime Clyde Walker, Princess Lutt Walker Burke and Princess Contenta Walker.

A Great Trio

A mother, daughter and granddaughter consigned by Albert E. Smith of Washington and purchased by Toyon Farms Association, Los Altos, for $6100. From left to right: Ava Model Hengerveld 2d, 30.53 lbs. butter; her daughter, Ava Hartog Pieterje, and the $2600 granddaughter, Korndyke Model Hartog 3d.

Agricultural News Notes of the Pacific Coast

Northern California

Rice planting has begun.

Butte County's spinach harvest is under way.

Hayward is harvesting its first commercial crop of spinach.

Marysville, Yuba County, is planning for a tractor convention.

Next week will be a great live stock week at the University Farm, Davis.

Susanville, Lassen County, reports ice on Eagle Lake 18 inches thick.

Paradise, Butte County, is making a special campaign against pear blight.

It is said that fur dealers are now paying as high as $18 each for coyote skins.

Shasta County farm bureau holds its annual picnic near Bald Ferry, May 3.

The Sperry Flour Company is to establish a feeding experimental farm at Escalon.

Glenn County is planning for several experimental plantings of long staple cotton.

Railroads announce that they are ready to handle wheat and other grains in bulk.

Livermore, Alameda County, is preparing ground for experimental plantings of tobacco.

Glenn County farm bureau will hold a fat stock auction early in April, probably April 7 and 8.

The Avery Company proposes to hold a series of tractor schools conducted by their own service men.

J. D. Knight of Vallejo asks readers of the Cultivator to assist in locating his 16 year old son Wade Knight.

H. C. Dunlap of the Prune and Apricot Growers Association addressed the Sutter County prune growers at Yuba City.

The board of supervisors of Eldorado County have appointed John A. Winkelman county horticultural commissioner.

R. M. O'Neill has been chosen to manage the California tractor demonstration at Arden Acres near Sacramento May 6-11.

Placerville, Eldorado County, has done considerable grafting of currant grapes on wine grape roots. The experiment is being watched with interest.

The Mendocino County Pear Growers Association last season was so successful that prune growers of the same section are now willing to cooperate in marketing their crops.

Rice growers of the Sacramento Valley are preparing for a fight against the duck and other game monopolists. They are appealing to the legislature to permit them to protect their growing crops from depredations of wild ducks and mud hens.

It is estimated that California rice production this year will be close to 6,000,000 bags. Last year's production from 147,000 acres was 3,500,000 bags, an increase of a million over the preceding year. Glenn, Colusa, Butte and Yolo have the largest acreages.

The Plumas-Tahoe Cattlemen's Protective Association with headquarters at Bangor, Butte County, has decided that it would not be advisable at the present time to put into effect a cooperative scheme of handling stock on the Tahoe forests, this owing largely to poor pasture and absence of trails to water.

Central California

Richgrove, Stanislaus County, is planning a new citrus packing house.

Immense crops of grain are reported from almost every section of the state.

The irrigation schedule for the Terra Bella irrigation district begins April 15.

Stanislaus and Merced farm bureaus have resolved to join the state marketing body.

Dos Palos, Merced County, farm bureau has been giving poultry culling demonstrations.

Turlock and Modesto irrigation districts are discussing plans for a $3,000,000 dam project.

Grain fields on the west side of the San Joaquin Valley show a growth far better than the average season.

Stanislaus County's fat stock auction resulted in one car selling at $15.85 with overweights at $14.85.

Fresno is planning for a great celebration of Raisin Day. One feature of the event will be a parade of returned soldiers.

San Joaquin Valley's sugar beet acreage is showing up remarkably well. Practically all the valley's crop is seeded in the fall.

Cattlemen are discussing the points in the new branding law. Every brand must now be registered with the Cattle Protection Board.

Hughson, Stanislaus County, is preparing to build a sorghum syrup factory. The operating company is to be capitalized for $10,000.

Butter fat prices to dairymen of Kings County average 60½ cents during the first half of March as against 66 cents for February.

Farm bureau auction sales announced by Kern County farm bureau are to be held at Wasco, April 5; McFarland, 12; Bakersfield, 19.

Orchard City grange held a regular meeting recently at San Jose and listened to address as to agricultural and other conditions in France.

Fearing that the state fish and game commission will not establish a hatchery in Tulare County the people are planning to finance a fish hatchery of their own.

Kern County farm center meetings: Kern Delta, April 2; McFarland, 4; Weed Patch, 7; Wasco, 9; Rio Bravo, 10; Edison-Fairfax, 11; Delano, 14; Pond, 16; Rosedale, 18; Shafter, 23; Arvin, 25.

The Mt. Whitney Power and Electric Company has appealed for increase in rates of five per cent. The San Joaquin Power Consumers Association is making appeal that this request be not granted.

Stanislaus County farm center meetings: Jennings, April 2; Mt. View, 4; Hughson, 7; Mitchell, 8; Thalheim, 9; Modesto directors meeting, 9; Tegner, 10; Denair, 14; Hickman-Waterford, 16; Fairview, 18; Wood Colony, 21; Claus, 23; Ceres, 24; Patterson, 25; Orange Blossom, 28.

Many wine grape growers in the San Joaquin Valley will dry their black wine grapes for sale to people who prefer to make their own wine. The dried grapes are shipped East, then soaked in water and used by the foreign population, Italian, French, Spanish, Greek and other wine users, for manufacture of wine in their own homes.

Southern California

Cotton planting has begun in the Palo Verde Valley.

Brawley is shipping out some three carloads of peas per day.

The San Fernando Valley has started a tree planting campaign.

The farm bureau conference is in Southern California this week.

A machine to peel citrus fruits has been invented by Orange County men.

Coachella Valley, Riverside County, will plant 100 acres of dates this season.

A Festival of Wild Flowers will be held in Santa Barbara some time in June.

A tractor school will be held in Anaheim April 11 and 12 by the Avery Company.

A new cannery is to be built at Redlands by the Redlands Fruit Products Company.

Brawley, Imperial County, ginned and baled its last cotton last week. Its total was 49,100 bales.

Abundance of irrigation water for southern San Diego County is impounded in dams and reservoirs.

Fruit growers and business men of Victorville are discussing the possibility of establishing a packing house.

Imperial Valley is the latest to discuss the matter of grain elevators. Sack handling is proving too expensive.

Orange County citrus growers are asking for an annual citrus institute to be conducted by the Riverside Experiment Station.

The Walnut Growers Association is asking the legislature to appropriate $10,000 to be used in the fight against the walnut worm.

The big new cannery at Wineville will be ready for operation by the middle of June. It will process both fruit and vegetables.

The raising of early Kentucky Wonder beans for the Los Angeles and San Francisco markets is becoming a feature of Laguna Beach industry.

A fight is on between gun clubs and farmers of Orange County over use of artesian wells to flood duck marshes for the benefit of sportsmen.

Riverside farm bureau proposes to purchase pure bred Guernseys, Holsteins and Jerseys in Eastern breeding sections and introduce to that county.

Banning reports a seasonal rainfall of 12.88 inches and heavy snowfall in the mountains assuring plentiful irrigation water. Apricot bloom was uninjured by the recent rains.

Ventura County farm bureau meetings for April: Oxnard, 8; Fillmore, 10; Wheeler Canyon, 14; Mound, 15; Moorpark, 16; Saticoy, 21; Santa Paula, 22; Simi, 24; Bardsdale, 28.

The state assembly has established a permanent boundary line between Ventura and Los Angeles Counties, to follow township lines. By the change Ventura County gains some 510 square miles.

The recently formed pool of Lima beans is now reported to contain 75 per cent of all beans in Southern California. It has been found, as a result of the activities in connection with forming the organization, that there are 100,000 bags less of Limas in this section than had been supposed.

The Coast and General

Several productive wells have been sunk by farmers near Chandler, Arizona.

Cabbage growers of Las Cruces, New Mexico, are planning for a big crop of cabbage.

Cotton growers of the Yuma Valley are endeavoring to secure one cent fare for agricultural laborers.

Stockmen of the Blue Mountains, Washington, are driving cattle to lower levels because of deep snow.

Texas onions growers are insisting on higher prices, and advance has been made in general quotations.

Western Venezuela's greatest industry is the growing of coffee. Two states produce over a half million bags.

Farmers of Casa Grande Valley, Arizona, are manifesting considerable interest in planting Thompson Seedless grapes.

Eagle claims to be the center of Alaska's agricultural district. The principal products are oats, barley, rye and peas.

A delegation of water users from the Imperial Valley recently visited the Salt River Valley and went over the entire project.

The export embargo on olive oil from Spain has been lifted, and the ministry of supplies will permit the export of 90,000 tons during 1919.

Missouri peach growers estimate from general condition of buds and the weather conditions of this season that at least 90 per cent of a crop will be secured.

Montana has built a large state owned terminal elevator at Great Falls. The building of this elevator was endorsed by a referendum vote of the people of the state.

Damage reaching to 75 per cent to tomato growers on east coast of Florida has been caused by terrific storms. The loss to Coast growers is claimed to be between five and six million dollars.

E. Draper, a prominent poultryman of Glendale, Arizona, was elected president and W. F. Fetterly secretary of the Maricopa County Poultrymen's Association at the annual meeting held the second Saturday of March.

The Whatcom County, Washington, Cooperative Egg Producers Association is returning to its members from one to five cents above local markets on each dozen of eggs. Some members have as high as 5000 laying hens.

The first carload of a government order for "fruit bricks" has gone forward and will be followed by others as fast as they can be turned out. These will go to France for the use of the American army now in that country. These go from Wenatchee.

Hay producers and hay dealers of the Salt River Valley are to hold a "hay congress" in Phoenix in the near future. The purpose of the gathering will be to arrive at a better understanding of the needs of the market and a closer cooperation in grading.

Denmark is a great dairy nation likewise a producer of large quantities of margarine. This industry was, however, almost ruined during the war because of oils and fats not being securable. The production in 1918 was only 1250 tons compared with 58,80 tons in 1916.

Santa Clara Valley Nurseries

By A. Layman

SCARCELY a country in the world but gets California nursery trees. This fact gave easy circulation to the story which newspapers had a few months ago that all Europe was to be restocked with trees shipped by California nursery men. While that story was of interest and showed the desire to be helpful on the part of some Californians tree producers all realized that it was a bit shy on facts.

The state is today the largest producing nursery section of the country; this as to citrus and deciduous trees, vines, ornamental shrubs, and we believe the time is coming when this state will save the country the importation of a great many cargos of "Dutch" bulbs.

Amongst the older nursery sections of the state is the Santa Clara Valley in which the first nursery was established in 1857. At the time of the organization of the first State Nurserymen's Association in San Francisco in 1858 there were nine signers to the constitution; four of these were from the Santa Clara Valley, one from Sacramento, one from San Lorenzo, one from San Francisco, one from Marysville, and one from Fruitvale. Hence Santa Clara's adaptability to the growing of fine nursery stock has been recognized for many years.

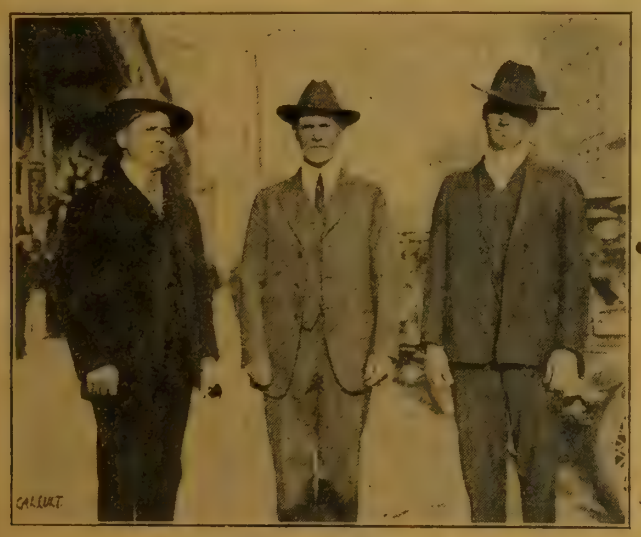
The original nurserymen's association served but few years of usefulness and for many years there was no association whatever. At the state fruit growers' convention held at San Jose in 1911 there was call made for a gathering of nurserymen in the rooms of the chamber of commerce, and the present California Association of Nurserymen was founded. And the Santa Clara Valley furnished at its initiation the greatest number of members of that association.

A Corner in a Gilroy Nursery

The large leaved plant is Paulonia imperialis. M. J. Crow is standing in front of this plant.

Being the prune center of the world, naturally San Jose nurserymen have given more attention to that fruit than perhaps any other section. Of plums and prunes there are two score which have been approved and grown largely in California and dozens of others grown experimentally or for curiosity. The prune d'Agen, or French prune, together with improved seedlings or sports which have come from it, is the sweet plum which has meant millions to California and to the Santa Clara Valley in particular. The alleged German "prune" and Hungarian "prune" are not prunes in the commercial sense, both of these fruits being usually sold fresh, and they are grown in limited quantity.

But the prune is not the only fruit tree produced in the Santa Clara Valley. The entire range of deciduous and even citrus trees are grown, and extensively. This is especially the case with apricots, cherries, apples and peaches.



To give even a list of the nurserymen of this rich valley would require considerable space for they are scattered in every section of the valley. But amongst the larger ones are the Leonard Coates Nursery at Morganhill; Max J. Crow Nursery, Gilroy; Ruehl-Wheeler Nursery, San Jose; Elmer Bros., San Jose; Chas. A. Ward, San Jose. Mr. Ward's central nursery is in Humboldt County, but in his San Jose sales yard are many thousands of choicest bulbs and rare shrubs.

This is prune blossom time in the Santa Clara Valley. The mountain tops are snow clad, the hills are a glory of color from the gold of the California poppy, the pink of the peach, and everywhere the green from growing grain or the native grasses, but more than all over miles of foothill and valley the snow white of prune blossoms. One seeing it today can hardly help exclaiming: "This is truly the garden spot of California—excuse me, of the world. Why shouldn't it be a wonderful producer or nursery of bulbs, plants and trees?"

Almon Wheeler

For many years Mr. Wheeler has been head of the Ruehl-Wheeler Nursery Company.

Father and Sons

Elmer Bros. Nursery is one of the larger nurseries of Santa Clara Valley.

Pistachio

On the hills of Leonard Coates Nursery Company pistachio trees are being given a thorough trial. These trees were seedlings but are now being budded over to the best known commercial varieties. Note where the bud has grown out from the old stock just below the hand of R. H. Coates, junior member of the Leonard Coates Nursery Company.

Faulty Irrigation

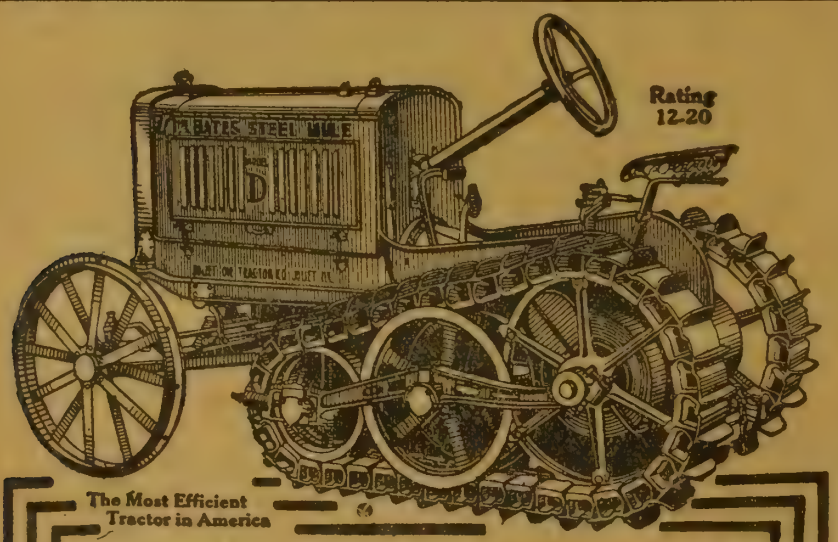
By H. Culbertson

SOME weeks ago the writer was interested in an article in the Cultivator along the above lines though applied in a different way. The writer of the article said that when he began irrigating 30 years ago he could trace a mouse across the field after plowing and harrowing, but that after that length of irrigation and the same preparation it would be difficult to trace a yoke of oxen across the field. It is not the intention of the writer at this time to criticize the conclusions expressed in that article, but the illustrations fit nicely in the description of some faulty irrigation.

The rainfall this winter having been rather short for the best plowing it has been excellent in revealing faulty irrigation.

Early in the winter the writer plowed two fields for grain. Neither of them had ever been irrigated. Both fields were slightly rolling. The water had overflowed some of the lower parts of both pieces during the floods in this section three or four years ago. A comparison of the different parts of these fields indicated that on the parts that had not been overflowed the surface was so fine that a mouse could be traced across it. The parts that had been overflowed were so cloddy that it would have been difficult to trace a yoke of oxen. Had the ground been in first class condition for plowing the difference would not have been so apparent. It reveals the fact, however, that the overflowed soil is more compact and evaporation is more rapid than on the other part. One of these pieces had not been plowed since the floods, the other only once. Both had had volunteer crops of hay.

Two other pieces have been plowed this month (March) that have been irrigated almost every year for 30 years. Parts of both pieces were in tomatoes the past year and could not be cultivated after the last two irrigations on account of the vines covering the ground. The slope on the first piece at the upper end of the furrows was good. The ground could be well irrigated without wetting the surface. Near the other end there was about 100 feet where the slope was not sufficient. The water rose almost to the top of the furrow before it would pass on. The result was a com-



Continued on Page 478

With the Return of
Peace and Prosperity
Plant
Teague Quality
Citrus Trees

With the present demand for food stuffs, the return of peace and normal economic conditions there will be a growing demand for all orchard crops and a corresponding larger demand for nursery trees. Already this return is finding expression in an increased demand for Teague Quality Citrus trees, which leads us to advise intending planters to book their orders early, as the available supply of really good, bud-selected (pedigreed) trees is rather limited. For this reason we invite correspondence. Prices cheerfully furnished.

The R. M. Teague
Citrus Nurseries
San Dimas, California

PROVED CRAWLER
DURABILITY

Correct mechanical principles and the knowledge of the proper materials and methods of using them make the crawler shoes of the Bates Steel Mule of great durability. Such is the result of six years of experience with thousands of tractors in the field.

Just as important are the heavy duty valve-in-head kerosene motor, the hardened cut steel transmission gears, the Timken roller bearings and the dustproof working parts.

You will be interested in seeing why the Model "D" STEEL MULE is the most efficient tractor on the market today.

THE ONLY CRAWLER TRACTOR ADAPTED TO BEET CULTIVATION WITHOUT MAKING CHANGES

The Future of Figs

By Mart V. Donaldson

THE 1919 Smyrna fig crop of California has been bid in by fig buyers at 20 cents per pound.

These buyers, representing Eastern capital, men who have a faculty for peering into future cultural and marketing conditions, are also taking the White Adriatics at 15 cents per pound and paying 11 cents per pound for the Black Missions. This, as against eight, five and three cents as stated pre-war quotations.

State's Figs Sold

On March 20, 1919; at the annual fig auction, held at the University of California Experimental Farm, four miles to the north of Fresno (Kearney Park), the prospective 1919 fig crop (Asiatics) was bid in by George C. Roeding for $30,000—in estimate, 15 cents per pound. Last year, the promised, and later realized, 100 ton Kearney Park fig crop, with ten tons of culls, was disposed of at $33,000. These crop transfers had to do with the sale on the trees of the annual product of 2400 fig trees.

These transfers also mean that the sums realized were quite all "velvet", in that, with the exception of five acres given to experimental growths, the 2400 fig trees producing this $33,000 and $30,000 crop are border trees about the vineyards and other lands of Kearney Park.

And these figures carry marketing and production suggestions that are interesting men of capital—East and West.

The years have demonstrated that California, Central California, must assume responsibility for the commercial fig production of the United States.

Marketing Comparisons

In 1885 the California production of prunes, the pride of the great Santa Clara Valley, was reported at 7,000,000 pounds. In 1917, the prune yield credited to California growers aggregated 218,000,000 pounds. With prune orchard expansion there followed the more persistent product introduction, the prune becoming an item of common diet. In 1885, California boasted an output of 9,000,000 pounds of raisins. For 1919, the California Associated Raisin Company officials report a production and a market appropriation of 400,000,000 pounds of Sun Maid and sun made raisins, the greater portion of this output but the assured reward of Fresno industry, in cooperation with Fresno sunshine.

Production Revelations

Today, 15,000,000 pounds of dried figs represent California's annual commercial pack. In 1885 the Seropian Bros., a then Fresno firm, packed a few Adriatic figs and peddled them to grocers of Pacific Coast towns. Of the present annual California production of 15,000,000 pounds of dried figs, quite 12,500,000 pounds of them are credited to Fresno County.

Of this aggregate California output of dried figs but 3,000,000 pounds are of the famed Smyrna variety, a limited bearing acreage alone being the determining factor. The balance of the marketing on the part of the California fig packers and growers includes 10,800,000 pounds of Adriatic and 1,200,000 pounds of the Black Mission figs. Under normal trade conditions, 20,000,000 pounds of dried figs are annually imported from South European and Asiatic centers. Of this annual importation 15,000,000 pounds are of the Smyrna variety, the fig that has become the boast of the Fresno growers.

In a review of these figures there is in the United States in assured estimate an annual dried fig consumption of 35,000,000 pounds, figures that point an excess of the present California (practically the United States) production of 20,000,000 pounds.

Possibilities Unmeasured

The United States boasts of a population of 100,000,000 people. One pound of figs for each person in the United States, on any day during any given year, would require an annual production of California figs of 100,000,000 pounds. And we use the term "California production" advisedly, for it is only here in California, and for the most part in the San Joaquin Valley, that the dried fig of commerce finds a home to its liking.

This realization is the result of a century-old worldwide search on the part of growers. So that fig growing enthusiasts, and their number is rapidly multiplying among men of business acumen, may plant, and plant, and then plant, and continue to plant—for 50 years.

For there can be no suggestion of an excess of production, in view of the assured demand—a demand that must annually increase, with the larger home marketing that shall be, in Fig Association market regulation, fully safeguarded.

In this belief J. C. Forkner, president of the California Fig Growers Association, is planning an extension to his great fig gardens, in the ultimate to comprise an area of 12,000 acres.

KEROSENE FOR APPLE TREE BORERS

By H. C. Coe

Have just read Mr. Calkins' valuable contribution in your last issue on the use of kerosene in the orchard and will give my experience in that line.

My father was the pioneer settler and apple raiser in the justly celebrated Hood River Valley in Oregon—a business that in later years has grown almost beyond belief, the apple growers association reporting a business of $2,102,900 for 1918. Upon my father's death in 1866 the care of the farm and orchard fell upon my shoulders. At that time farming and fruit raising was a pleasure not enjoyed nowadays. There was absolutely nothing in the line of insect pests, no woolly bugs, no scale, no codling moths, no, not even a nasty corn worm. How well I remember the great luscious ears of sweet corn that would grace the breakfast table. It was the veritable golden age of the Oregon farmer and orchardist.

But those times could not last forever. On one of my trips through the orchard—we had about 20 acres of all kinds—I noticed that in the forks of some of the trees in the early spring the bark was rough with many wood borers' holes in it, and upon closer examination found many other trees worm eaten. The horticultural authorities called the trouble "apple tree borers", and the remedy, an attack in the rear with a sharpened wire. Armed with this deadly weapon I began the assault, only to meet defeat. The grubs only went through the bark to the newly forming wood and not into the body of the tree, and they were there by the hundreds, from the newly hatched worm to the full grown grub, about one-half inch long, and I was at my wits' end.

Now about this time kerosene was coming into general use for lighting purposes, also highly recommended as a mothers' remedy for sore throat, diphtheria and kindred troubles. Why not a remedy for tree troubles? "But," said a neighbor orchardist, "kerosene is powerful stuff; it will kill your trees." "Well, just as well kill them with doctoring as to let them die of disease." "Yes," was the rejoinder "burn your barn to get rid of the rats." But the kerosene went on just the same, poured it on out of a gallon can, no spraying, soaked all suspicious parts thoroughly, and to the surprise of everybody, myself included the trees did not die nor show any injury whatever, but the bugs were dead, every one. The trees improved rapidly and in a year or so showed no signs of worm depredations, nor was I ever seriously troubled with them again.

Built As Well As We Know How

THE Goodyear Cord Tire is tangible evidence of our belief in the triumph of manufactured goodness.

It is the very finest tire that we know how to build—much finer than we could have built five, three or even two years ago.

It is built thus finely in the simple conviction that the most people want that kind of a tire.

There is considerably less conscience or idealism in this policy than of what may be taken as sound business sense.

The Goodyear Cord Tire travels smoothly and surely, and it lasts uncommonly long.

Among users it has aroused an expectancy of mileage easily double that of four years ago.

Its reputation and employment are steadily and swiftly growing as word of its advantages becomes more widely spread.

Today it is standard equipment on a pronounced majority of the finest motor cars built in this country.

The Goodyear Cord Tire costs more money to buy than do tires of an earlier type.

Its additional cost represents additional material and labor that are actually embodied in the tire.

It is the experience of users that despite their somewhat higher purchase price, Goodyear Cords cost less in the end.

Our factories have succeeded in attaining normal production and Goodyear Tires are now available everywhere.

THE GOODYEAR TIRE & RUBBER COMPANY, AKRON, OHIO

Help the Tractor Help You

By Rush Hamilton

WHEN purchasing a tractor the buyer will invariably investigate several makes and several types before making his selection; he will carefully compare costs, quality of work, time saved, service promised, past performances, and almost everything else that can be investigated, because he is making a business investment and considers his time and effort well spent.

With the decision made and the new tractor on the farm, the tendency in many cases is to now put it all up to the tractor. Results have been promised, results have been paid for, and results are expected—but unless the same care, thought and judgment is carried on to the operation and maintenance of the tractor, results will not be obtained.

We can all remember what the tractor promised to do for us: cheaper work, better work and at a great saving of time, but what did we promise to do for the tractor? Right now is a good time to get out that little book that came in the tool box and read over some of the promises you have made. Have you drained the crankcase oil? Have you cleaned the clarifier? Have you oiled and greased where necessary?

There are, however, many little points, mostly taught by Old Man Experience himself, which will aid you in getting capacity work out of your tractor.

First, be sure of your hitch. The wrong hitch may increase your draw bar pull as much as 100 per cent.

Then do not overload. A load so heavy as to cause slippage or occasional stopping is fatal to real results. More work will be done by sundown if your tractor has been running along all day at an average speed and a normal load, and you will have the added satisfaction of knowing that you can expect the same amount of work to be done the next day. One breakdown during your busy season would eat up a lot of time gained by "war time" methods.

Keep your plow points sharp—it won't cost much in either time nor money, not nearly so much as tractor "feed."

When plowing in orchard or vineyard divide the side draft equally between plow and tractor. Enough side draft should be allowed to throw the soil up to the tree or to take away the soil as close as possible without injury to the tree. The tractor should be far enough away to clear the limbs. When these positions have been determined it will not be necessary for the operator to watch his plows continuously.

The plow should be level to avoid high and low furrows and adjusted so the first bottoms will cut the proper width each time around.

A little oil on the plow lift helps, and the lifting spring should be at the proper tension. A tremendous amount of time can be lost on the turns if these points are overlooked.

Stiff hitches should be used—often it is a big advantage to be able to back up—even the Germans found that to be true.

And so it goes, on down the line. Save ten minutes here, five minutes there, and 15 minutes some place else. The day is done and so is your work.

But—the tractor alone did not do it, and probably no tractor ever will. It's the combination of man and tractor that got the results.

FAULTY IRRIGATION

Continued from Page 475

plete saturation of the surface. In this where the surface was not made wet it plowed and harrowed in such fine condition that the mouse could be traced over the surface. The low part at the other end where it was made so wet was hard and lumpy, making it difficult to trace the oxen across.

On this same piece were two strips of corn planted the whole length (planted to draw the worms away from the tomatoes). The corn was cultivated after each irrigation. This part showed good cultural conditions all the way through.

The other one of the two pieces referred to all had a good slope for irrigation. It was in tomatoes and could not be cultivated after the last two irrigations. While it was well irrigated none of the surface was made wet. It worked remarkably fine in the recent plowing and harrowing. About one-half of this tract was a tomato seed bed and was saturated to the surface the last two irrigations and without cultivation. This plowed up very lumpy, and the bottom of the furrow wore the plow points like a grindstone. All of this piece had a good stand of burr clover eight to twelve inches high. The only difference that can be given is the difference in the surface irrigation. There was at the lower end of the rows on the other part a little rise so the water could not flow away and wet all the surace, the water even standing on the surface for a few feet. This was very hard also.

These are simply facts stated as they were found. The conditions were more apparent on account of the slightly dry soil. This opens a big subject in irrigation management of soils that needs more attention. We are well aware that many do not consider they have a good wetting of the soil until the surface is wet or as some say will bog a saddle blanket. Yet there is much evidence that such treatment of clay soils lacks much of being followed by the best results. Along this line we have much to learn to our advantage before we can call ourselves experts in handling soils.

LESS TROUBLE WITH TRACTORS

It takes about two and a half gallons of fuel an acre to run a tractor for plowing in the Dakotas, acording to reports from several hundred farmers. These reports, summarized in Farmers' Bulletin 1035, cover two, three, four and five plow tractors of various makes.

Slight differences in fuel consumption are found between machines of different makes, and there is usually a slightly lower consumption where gasoline is used than where kerosene is used. These differences, however, are so small that the average of two and a half gallons may be taken as coming very close to the actual acre consumption for any type or size of machine.

The more recent reports received in this regard indicate that farmers are having much less trouble than formerly in handling kerosene burning tractors. Nearly two-thirds of the tractors on the Dakota farms reporting burn kerosene, and the results are apparently satisfactory, particularly in view of the fact that the present price of kerosene is but half that of gasoline. However, the advantage of gasoline in ease of operation and in the additional assurance it gives that the engine will keep running steadily makes many men prefer the more expensive fuel.

Questions and Answers

ANSWERS BY EDITOR AND STAFF

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Damaged Flour for Poultry Feed

It is my custom to have before my hens at all times a dry mash in a self feeder and same consists of a formula quantity of bran, middlings, beef scrap, egg layer and salt.

Since I am now unable to obtain middlings, I desire to use some white wheat flour that has been disturbed by mice but not stained. They have run over it and the good housewife is "set" against using it and I wish your expert would advise what quantity of same I can use with the above and not constipate the hens and pullets. I am of the opinion that the flour will be more costive than the middlings, hence the necessity of using a lesser quantity in proportion to the bulk of mash mixture and I will thank you for your advice in the matter.—Subscriber, Reno, Nevada.

I do not know the nutritive ration of the flour you wish to use but it is probably not far from that of low grade or feed flour, which is given in Professor Jaffa's tables as 1:8. As the nutritive ration of wheat bran is 1:3.4, and that of the average beef scrap about 1:0.5, a mixture of four parts bran (by measure), two parts flour, and one part beef scrap will give you a mash the nutritive ratio of which is 1:5. If you find this constipating, make the proportion of bran a little greater. It would be better if you could add corn meal or ground barley to your mash. A formula used by the Maine station consists of 100 pounds bran, 50 pounds corn meal, 50 pounds low grade flour and 100 pounds meat scrap.—J. A. K.

Defoliating Citrus Stock

In shipping citrus stock is defoliation required as a protection from scale or is it done simply because it is best to insure growth?—J. F. C., San Diego, County.

Defoliation is not required in this state excepting in one county and that is Tulare. However, many prefer that it is done so that trees dipped in insecticide may be reasonably free from any infestation. Where trees are not to be shipped, and where it is positive they are free from all insects, we would prefer trees on which foliage is allowed to remain.

Napier Grass

What is the right time to plant Napier or Elephant grass? Should it be planted in rows or hills and how far apart? Can it be fed to horses as well as to cows?—Subscriber, Soledad.

Experience with Napier in this state is as yet too limited to give definite instructions as to growing from seed. In fact we have seen growers of Napier grass who claim that it could only be grown from cuttings. However, we see no reason why it should not be grown from seed and presume the present is as good a time as any in the year, though in cold soil it would perhaps be better to hold until warmer and longer days before planting.

Skim Milk for Baby Chicks

Kindly inform me through your columns whether you consider milk (skimmed but not "separator") as a good food for baby chicks. If so, when and how is the best method to feed it?—Subscriber, San Diego.

Skim milk is one of the very best feeds for baby chicks. It is often given in fountains instead of water before the chicks have had any other food. Because of the lactic acid which develops in the process of souring, it is considered rather more wholesome, besides being more easily fed, if it is allowed to sour before feeding. The practice, quite general on farms, of setting a pan of milk on the ground and letting the chickens help themselves has several objections. A good deal is wasted, for one thing, and for another, this method of feeding is believed by some to encourage the growth of intestinal worms. In any case the milk soon becomes filthy and unfit for use. The best methods of feeding are either to let it thicken and then use to moisten the mash two or three times a day or to make into cottage cheese and feed alone or with rolled oats or a regular dry mash mixture. If I had an unlimited supply of sour milk I should keep a mash moistened with it before my chicks most of the time after the first three weeks, omitting the dry mash. Chicks that have all the sour milk mash they will eat make a very rapid growth.—J. A. K.

Soft Shelled Eggs

Will you please tell me what makes chickens lay soft shelled eggs? I feed them milo maize, rolled barley, dry egg mash, and oyster shells they have before them all the time. I occasionally feed them green feed once or twice a day.—Subscriber, Carpinteria.

Soft shells are due to lack of lime, as a rule, but sometimes overfat hens lay soft shelled eggs even when they have plenty of lime. If your hens are not overfat and are laying soft shelled eggs in spite of having oyster shell before them, try giving them coarse grit or bits of granite rock to pick at. Hens that are on decomposed granite soil do not often lay soft shelled eggs. If they are on adobe or a soft loam they need more lime to make up for what the soil lacks. There is a difference in breeds in this respect. Hens of the heavy breeds as a rule will lay harder shelled eggs with less lime than some of the lighter breeds.—J. A. K.

Cropbound Turkey

Can you tell me what was the trouble with a seven months old turkey tom? At first seemed to have diarrhoea, then indigestion. He died in about ten days. Weighed 26 pounds. I opened the crop and all around the entrance was just hard like the inside of a gizzard, a place as large as the palm of one's hand. The food could not pass from the crop. He ran on green alfalfa and was fed corn.

The cropbound condition of the turkey tom would explain his death. It was probably the result of inflammation due to too generous a diet in his infancy. Had you examined the liver, I suspect you would have found on it the yellow spots that indicate blackhead.—J. A. K.

Sorghum—Milo

What is the food value of grain sorghum? Is it to be compared with milo maize?—Subscriber, Bakersfield.

The value of grain sorghums is practically the same as that of Indian corn, and in the sorghums are included, milo, kafir, feterita, the duras, and many other grains. Henry's "Feeds and Feeding" says that though less palatable than corn their nutritive value ranges from fully equal to this grain to 15 per cent less. The table of digestible nutrients shows milo to contain 8.7 protein, 66.2 carbohydrates, 2.2 fats, a nutritive rato of 1:8.2. By nutritive ratio is meant the ratio that exists in any given feeding stuff between the digestible crude protein and the combined digestible carbohydrates and fats. In feeding corn, the sorghum grains or barley it is to be remembered that they are comparatively low in protein, especially when compared to wheat, the ratio of which is 7.7. Hence in feeding these grains more meat or other feed rich in protein must be supplied. We hardly know what the inquirer means by the value of grain sorghum as compared with milo. If she means the ordinary sweet sorghum, we find no analysis but presume it is materially the same as the other grain sorghums.

Composition of Beans

Kindly let me know the percentage of nitrogen, phosphoric acid and potash contained in Blackeye beans. If ground and used as fertilizer how much would be available as plant food?—Subscriber, Fullerton.

Put this bin on your farm

CALCO METAL GRAIN BINS are made to **save** grain. They save by preventing waste at its starting point—in the field.

A Calco Grain Bin on your farm will starve out the rats and gophers that cost you so much. It will protect your grain from the rain, the sun and the winds.

It will do away with costly sacks and needless extra help.

When your grain has gone to market, store your seed grain in a Calco Grain Bin. Or, protect your fodder, your other perishable produce, or your tools in a Calco Bin.

It pays for itself quickly

A Calco Grain Bin on your farm will pay for itself almost before you realize it. After that it lasts years—and costs not a single penny.

Two men can erect a Calco Grain Bin very quickly with hammers and monkey wrenches. The Armco galvanized sheets come to you already punched and shaped to fit—with strong, galvanized bolts ready to hold them together. It's easy to follow the simple printed instructions for erection.

Calco Grain Bins are made in capacities from 600 bushels to 5450 bushels: Send TODAY for the Calco Grain Bin price list.

Why farmers everywhere are buying the GRANT SIX

There is a big demand for the GRANT SIX from business farmers all over the country. A generous proportion of our sales for the past four years has been to owners of farms. We have tried to analyze the reason.

It is easily determined that price alone has nothing to do with this preference. Even during war times, when high prices obtained, a steady stream of business from rural districts poured into the Grant factory.

Nor is it traceable to our distribution for we are equally well represented in the big cities where the sales are constantly growing.

Inquiry amongst hundreds of purchasers as to the cause of this preference for the GRANT SIX shows some perfectly natural and obvious reasons —based on common sense.

First, they say the GRANT SIX is neither too large nor too small. It has speed. It operates smoothly. It rides easily. It is comfortable, stylish and well finished, and its mechanism is simple, accessible and easily cared for by anybody.

Again, operating cost is low. There is plenty of gasoline to be had, but when one can do better than 20 miles to the gallon in comfort, why be content with 7 to 10 miles? GRANT SIX owners average 900 miles to the gallon of oil. At present prices that means a big advantage. And GRANT SIX owners average 7,000 miles to the set of tires. And the GRANT SIX is built to stand hard service. These same facts are certain to lead you to choose the GRANT SIX.

Bean seed, which is presumably average of various kinds of beans, has shown under analysis that 25 bushel crop will yield 60 pounds nitrogen, 18 pounds phosphoric acid and 19.5 pounds potash. The above is according to one table in "Fertilizers and Crops" by Van Slyke. Another table in the same book gives in pounds per hundred or percentage, nitrogen, 4; phosphoric acid, 1.20; potash, 1.30.

Caustic for Dehorning

Will you please tell me how to properly apply caustic potash to prevent the growth of horns on young calves? —Subscriber, El Centro.

The latest edition of "Diseases of Cattle" issued by the department of agriculture gives the following instruction: "A calf should be treated not later than one week after it is born, preferably when it is from three to five days old. The agent to be used may be either caustic soda or potash in the form of sticks about the thickness of an ordinary lead pencil. These caustics must be handled with care, as they dissolve the cuticle and may make the hands or fingers sore. The preparation of the calf first consists in clipping the hair from the parts, washing clean with soap and warm water, and thoroughly drying with a cloth or towel. The stick of caustic should be wrapped in a piece of paper to protect the hands and fingers, leaving one end of the stick uncovered. Moisten the uncovered end slightly and rub it on the horn buttons or little points which may be left on the calf's head—first on one, then on the other—two or three times, allowing the caustic to dry after each application. Be careful to apply the caustic to the horn button only, for if it is brought in contact with the surrounding skin it will cause pain. Too much moisture on the stick of caustic will allow the application to spread to the surrounding skin. After treatment keep the calf protected from rain, as water on the head after application of the caustic will cause it to run down over the face."

Ants and Bees

Can you tell me how to keep ants out of bee hives? The hives stand on legs about one and one-half feet from the ground in cans filled with water and kerosene. Rags soaked in kerosene and tied around the legs of the hives seem to have little effect. Have moved the hives but the ants are still on the job.—Subscriber, Santa Barbara.

Certainly these ants enjoyed their kerosene bath. Would suggest clearing away absolutely every weed and all the grass which may be near the hives, then make careful inspection of every foot of ground within a hundred yards of hives, and by using gasoline, carbon bisulphide or even boiling water, destroy every ant colony. If this is done we do not think there will be any further trouble. One beekeeper has recommended the finding of the trail followed by the ants in coming to the hive and using the ordinary ant poisons offered at nearly every store. Of course these poisons should be covered so that the bees will not readily find them.

Bugs

Please tell me the name of these bugs and how to get rid of them? They crawl on the outside of the house and enter through the windows. I notice holes are eaten in the curtains, carpets and clothing. I can find six or eight at one time on the side of the house on a warm day, and after burning can find almost as many the second time.—Subscriber, Orosi.

Think our subscriber is mistaken as to the injury to clothing, curtains and rugs by this insect. We have been unable to get the specific name of the insect but it was sent to Harry S. Smith, superintendent of the state insectary at Sacramento, and he writes:

"There are numerous species of this kind of insect and only a specialist can distinguish them. They belong to the same order as the Harlequin cabbage bug, the squash bug, etc., and feed only on living plants. I rather imagine that crickets are responsible for the holes in the curtains, carpet and clothing, at least we have a great deal of difficulty of that kind here. Until we can ascertain just what in-

In addition we may add that it may be well to look for Buffalo bugs which may be a serious pest.

When to Cut Rye for Hay

In a late number of the Cultivator I saw an inquiry about rye hay for cows wherein inquirer was advised to cut it when in the dough. Now I have had considerable experience with rye as hay and have learned that it should be cut just before blooming to be of much value as cow feed. I have cut it in the dough and had the pleasure(?) of using it for bedding as no stock will eat it. One year ago this last winter I fed a large quantity of it cut before blooming to my herd of cows and although they had full rations of corn silage they ate it greedily. It is an established fact, I believe, that all plants lose their protein content very rapidly after the blooming stage, and as protein is the desirable content for the production of milk we should so handle our crops as to retain all of it possible.

Another reason for cutting it at the right stage of growth is to secure palatability. No feed, however valuable in nutritive content, will give satisfaction unless it is relished by the animals to which it is fed. Your correspondent may not secure quite so many pounds of cured hay cut before blooming but will secure more pounds of butter or gallons of milk from the same acreage.—A. P. Martin, Petaluma.

Kidney Beans

Will you tell in your paper whether kidney beans will do well in this part of the state and if there is any market for them here, also where to get best seed?—Subscriber, Monrovia.

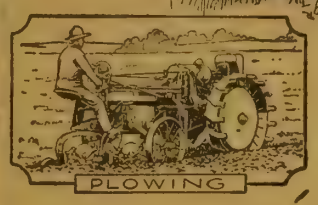
This question was referred to H. L. Musser, and he answers:

"We presume your writer means the Red Kidney which is sold at nearly all grocery stores. This was probably the most profitable bean in the commercial world prior to the introduction of the pink beans, but because it is of excellent flavor and keeping qualities it still finds a ready sale among the grocery trade although it is a larger bean than is generally desired for cooking purposes. It grows to perfection in Southern California and quite a large acreage was grown at Norwalk last year. Some years ago there was a large acreage grown at Sierra Madre with satisfactory results. This bean is also a good variety to plant in the late fall for string beans; it will withstand light frosts and is much hardier than the ordinary string bean. As there are many varieties of kidney beans it is possible that your correspondent means something else, but we have described the one commonly known as the Red Kidney."

Flame for Gophers

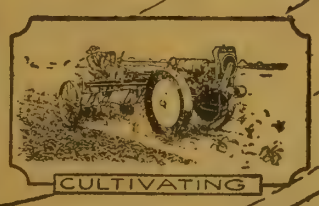
What is liquid flame? I see it is recommended for killing squirrels and gophers. How is it produced and applied?—Subscriber, Los Angeles.

This liquid flame is more in the nature of a blast torch which has been tested out by a deputy of the state horticultural commission. It is an apparatus equipped with a steel pressure tank and two lines of hose feeding the burners. With slugs and surface pests its application is easy and results absolute. The application of carbon bisulphide on waste balls and exploding in the burrows of gophers and squirrels is also sometimes practiced.



MONKEY HABITS

"An untrained boy and a monkey are very much alike in their habits," says Dan Beard in his "How to Make" articles in Boys' Life for March. "Give a monkey some object in which he is interested and as long as his interest lasts he will hold the object in his hands; the moment his interest wanes he will loosen his grasp and allow the object to fall just where he happens to be at the moment. An untrained boy will do exactly the same thing, and so will an untrained man, for that matter."



One Man Harvests 40 Acres a Day with this Outfit

MOLINE UNIVERSAL TRACTOR
and the new Moline 10 Foot Grain Binder

This new Moline 10-ft. tractor binder attached to a Moline-Universal Tractor running 3¼ miles per hour, with one man in control of both tractor and binder, will cut 40 acres of grain in a ten-hour day. This is more than 2 men and 8 horses with two 8-ft. binders can do; and more than 3 men with any other tractor pulling two 8-ft. binders can do.

Considering the amount of work it will do, and the saving in expense, the Moline 10-ft. binder is the lowest priced binder ever made, and it will last twice as long as any other. But of greater importance is the fact that you can now harvest your grain when it is ready in half the time you ever did before—this may save you the price of the entire outfit any rainy season.

The Moline 10-ft. Binder is made to work with the Moline-Universal Tractor. One man controls both tractor and binder from the seat of the binder. The entire outfit is easily and quickly backed to turn square corners so that a full width of cut can always be maintained. The new Moline Binder is constructed heavier throughout and has much greater capacity than any horse drawn binder.

Equipped With Hyatt Roller Bearings

Important bearings, 32 in all, are equipped with Hyatt roller bearings. These bearings double the life of the binder, allow it to run at much faster speeds, make lighter draft and require only one oiling a season. This feature alone saves one hour or more a day. Elevator gears are enclosed and packed in grease. There are many other features about this binder which enable you to harvest faster, cheaper and better than you ever did before.

A header attachment is provided so that the Moline Binder can be easily, and at small expense, converted into a header.

If you have only 20 acres of grain to cut, it will pay to own this outfit. You will pay for binder cutting your own and neighbor's grain.

Moline Tractor Works Year 'Round

After harvesting you can use your Moline-Universal Tractor to run a small separator and do all the threshing in your neighborhood. There is no end of uses for the Moline-Universal Tractor. You can plow, disc, seed, cultivate, mow, harvest, etc., and do all your belt work with it.

The Moline-Universal Tractor does all farm work *including cultivating*, and one man controls both tractor and implement from the seat of the implement.

Thousands of farmers in all parts of the country are proving every day that the Moline-Universal is the most practical, economical and efficient tractor made, that it practically doubles a man's results and reduces expense.

It will pay you to use the Moline-Universal Tractor and Moline Grain Binder this year. See your Moline Tractor Dealer now or write us for full information.

Get Your *Irrigated* Farm From the Canadian Pacific

IN a climate not excelled by any agricultural area in America you can own a fine, rich farm of your own. The Canadian Pacific Railway offers you this opportunity to achieve independence and grow rich—in Western Canada. The lands offered are in the largest and most substantial irrigation undertaking in the Continent. The price is only $50 an acre—some for less.

Twenty Years to Pay
You pay down 10% and have 20 years in which to pay the remainder. The first crop is often worth more than the total cost of the lands.

$2,000 Loaned to Farmer
Loans of $2,000 in improvements are made to approved settlers on irrigated farms with no security except the land itself. You can take 20 years to repay this loan at 6% interest.

Irrigation, Crop Insurance
This land is not arid but production can be greatly increased by irrigation. There is an unfailing supply of water which is administered under the direction of the Canadian Government. The provinces have no control over it and there is no conflict of law or authority over its use. The water is free, the only charge being a fee of from 50c to $1.25 per acre for the maintenance of the system and the delivery of the water. Irrigation here is *not* an experiment.

Why an *Irrigated* Farm?
Because irrigation in Southern Alberta
—insures crops every year
—increases crops every year
—makes you practically independent of weather conditions
—produces great quantities of coarse grains, pasture, alfalfa, roots, thus developing the live stock industry which is safer and ultimately more profitable than wheat farming
—tends toward close settlement, well cultivated farms, good neighbors, good roads, schools, churches, telephones, mail delivery, co-operative marketing, and a high standard of community life.

The Opportunity for You
The Canadian Pacific Railway knows that its prosperity depends on the prosperity of the settlers along its lines. Because it wants good settlers it is willing to sell its lands at these remarkable prices and terms.

Send for special railway rates and special booklet fully describing all lands and giving all details.

This Month in the Ornamental Garder

Northern California

By A. R. Gould

DURING the month our gardens will continue the bulb display and many other spring flowers will be out as well as the best of the flowering trees and shrubs. In planning a garden one should include some of these and select them according to their period of flowering. Flowering peaches, apples, cherries, magnolias, the Judas tree, lilacs, spireas, weigelas, all contribute their share through the coming weeks.

The roses should have been put in shape toward the end of the month and all new plantings completed. All climbing roses should be tied in and dead wood removed. Farm yard manure or an artificial fertilizer should be dug in at the roots. Apply sulphur at the first sign of mildew and spray with Blackleaf 40 for aphis which are usually very troublesome at this time.

The Wild Garden

No spot in the garden can be made to look more charming than the wild or informal garden. Foxgloves, or digitalis, grouped around among the trees give a natural touch with their tall spikes of spotted pink and white flowers, and after flowering, if left undisturbed, they very quickly reseed themselves, and all the attention they need is a little thinning out as the seedlings become of suitable size. Ferns may also be planted at the base of the trees in a mound of leaf soil. In various open spaces seeds of Nemophlia insignis, "Baby Blue Eyes", Clarkia elegans, Collinsia, and Blazing Star, all native wild flowers, may be sown. Lupins also add color to the scene and may be secured in various colors. One new type, Lupinus Paynei, discovered and introduced by a well known Los Angeles seedsman, is quite an acquisition and grows four to eight feet high. Seeds of these should be soaked in water before being sown where the plants are to remain.

Salvias

There are quite a number of these. The red flowering type most commonly known is Salvia splendens. A beautiful deep blue is Salvia patens, and another very useful herbaceous perennial type is S. uliginossa, which has flowers of pale blue very valuable for cut flowers. Secure plants now from your nurseryman for planting in the beds or borders for the summer and fall display.

Phacelia Campanularia

This beautiful native blue flower is worthy of a place in every garden, having quantities of intense blue flowers. Seed should be sown on a well prepared border and the seedlings thinned out when several inches high.

Low Growing Plants

Silene pendula, a hardy annual, and portulaca in yellow, white and scarlet are fine subjects for carpeting flower beds. Seed should be sown at once broadcast.

Asters and Schizanthus

These should be sown this month to secure flowering plants for the summer display. Sow in boxes of fine soil and transplant.

Plants for Window Boxes

For large sized window boxes plant a few dwarf evergreen shrubs such as box or Aucuba japonica, and in between marigolds, French dwarf, myosotis and coreopsis may be placed. For trailing effects use ivy geranium, lobelia gracilis, asparagus sprengeri and lotus peliorhyncus. These boxes should be at least 14 inches deep and well drained, the soil of good garden loam mixed with manure.

Cyclamen and Begonias

Secure tubers of these and start them into growth in a warm but shaded frame. They will eventually prove valuable for planting in a shady place and flower throughout the summer. Begonias of the tuberous type may be secured in various colors, single and double.

Dahlias

These popular flowers which provide us with summer and fall bloom may be planted this month. The soil should first be deeply trenched with well rotted manure and the tubers planted with at least two or three shoots or eyes. Seeds may also be sown at once under glass and the resulting seedlings will flower this season.

Southern California

WAR gardening has resulted in one good feature in some city churches, which it appeals to us might give results in rural churches, farm bureaus, farm clubs or other organizations. As carried out in some city churches this has resulted in plant, bulb and seed exchange day. One member who is long on choice geraniums, Shasta daisy plants, iris, or other desirable additions to the home garden proceeds to the church or gathering place and exchanges her wares for dahlias, amaryllis or other desired plants or bulbs.

The nitrate of soda or other fertilizer put on the lawn at the beginning of last month has resulted in a wonderful growth of green. It is surprising how quickly nitrate of soda shows in new lawn growth. Presumably its application was preceded by a good raking and possibly rolling—although that is not so necessary in California as in the East—and now the problem is to keep the lawn bright and green and well clipped. Weekly or at least bi-weekly clippings are necessary if a good looking lawn is to be maintained. The lawn looks better where the catcher is used and the clippings fed to the poultry, but I believe more permanent growth may be secured by allowing the clippings to fall on the plants. Of course, if fed to the poultry and the poultry manure returned to the lawn, so much the better. If the rains fail to come with reasonable regularity be sure to keep the sprinkler going on the lawn, and those who did not fertilize, as suggested last month, should either make application of commercial fertilizer or apply well rotted manure which may be well washed into the soil and after remaining on the lawn for a few days raked off and carted to the compost heap.

Watch for aphis; they will be on almost every plant that grows. Liberal use of tobacco dust acts as a repellent and will destroy many of the pests. It

kept down entirely during this month and weeds around the place destroyed so as not to afford breeding place for them the infestation is so reduced that control is comparatively easy.

In bulbs, divide the cannas, calladiums, cyclamen, and if dahlias were not taken up and put into the basement as they should have been in the fall, they may be divided. They are already sending out little stalks. Be careful in dividing that the stems are not broken off, for these tubers, unlike the potato, have no eyes excepting at the stem end.

Continue sowing annuals and perennials. This is a good month for sowing the seed of columbines, foxgloves, daisies, gaillardias, coreopsis and snapdragons. Hollyhocks may be planted also, and, while a little late, larkspurs may also be planted. Goldenrod, golden-glow, or rudbeckia, and Shasta daisies may be divided.

This Month in the Vegetable Garden

Northern California

By A. R. Gould

APRIL should be the progressive month this year after the somewhat cold weather we have experienced during the past few months. We have now reached that stage in the season when growth will be rapid; our seeds will germinate more quickly and we shall also be kept busy destroying weeds. The rainfall is now above the average in most districts and prospects for the season are extremely bright. See that the tools are in good shape, the spade and hoe kept sharp, as dull tools do poor work.

Potatoes

You may continue to plant this month, and if the tubers have been sprouted, as we advised last month, before planting earlier crops will result. For complete planting directions see our notes in the issue for March 1. When the plants show several inches growth above the ground they should be "earthed up," which term implies that the soil must be drawn up toward the plant in the row to act as a support and protection to the young growth. At the first appearance of aphis, green or black fly, spray with Blackleaf 40, at the strength advised by the manufacturer.

Peas, Garden and Field

Continue to sow Little Marvel and Stratagem, for maintaining a supply. Hoe or cultivate between the lines of those sown earlier and conserve all the moisture possible. Cow peas may also be sown for cover crops in the orchard and for green manuring. These may be drilled in after the ground has been put into shape and at the end of the season will be more than valuable as they will have increased the supply of nitrogen in the soil and will also provide green manure when plowed under. Very few as yet have realized the value of these methods of enriching the soil in their orchards and it is absolutely essential for best results. Sow 60 pounds of cow peas to the acre.

Parsnips

Sow seeds of the variety Hollow Crown in rows 18 to 24 inches apart. The soil should have been well prepared and deeply trenched with manure.

Tomatoes

Complete the planting of this crop towards the end of this month. The young seedlings should now be making good progress in the frames. When planting out avoid the heat of the day; evening or early morning is the most suitable time and the plants should be watered until they become established. Those who failed to sow early enough may secure plants from the nurserymen.

Squash and Pumpkins

It will be safe to sow these now in mounds about four feet apart. Three or four seeds to the mound should be sown and watered in. The best varieties of squash are Early White Bush Scallop, Boston Marrow and Hubbard, a good winter variety. The Vegetable Marrow is also popular, and besides being a good vegetable makes an excellent preserve. Among the pumpkins, California Field, Morse's Marrow and New England Pie.

Melons and Cucumbers

Culture of these is practically the same as for squash. They require fairly rich soil and a warm, protected position as well as a moderate water supply. The best muskmelons are Gold Line Rocky Ford, Extra Early Citron and Fordhook, the last named being of small size but of delicious flavor. Watermelons; Florida Favorite, Harris Earliest for districts where the season is short, and Klondyke. Golden Beauty is the best casaba as a winter keeper. Cucumbers; Long Green for general use and Early short green for pickling. Lemon is a small round type now very popular.

Lettuce

Make successional sowings of White Paris Cos, Los Angeles and May King. Sow very thinly in rows and do not waste good seed on poor ground.

Beans, Dwarf and Pole

During this month both types may be sown, but in the colder sections make the first sowing during the last week in the month. For dwarf varieties we advise Golden Wax, Davis White Wax, an excellent shelled bean, Canadian Wonder, Stringless Green Pod and Refugee, a most prolific bean and very hardy. It will take one pound of seed to sow 100 feet in rows which should be about 24 inches apart. The same cultural directions apply to pole beans, but these of course need support. There are both green and wax podded varieties. First and foremost is Kentucky Wonder, a green podded type, and another very good type

80 truckloads of cabbage in your pants pocket—yes sir!

Sounds improbable—you say? Not at all! Listen: a one-half pound bag of Morse's cabbage seed will slip into your pants pocket. And that amount of Morse's Seed can easily produce on four acres of average soil, 80 truck loads (10 carloads) of cabbage—worth at least $75 a truck.

Good seed—Morse's Seed—is the concentrated equivalent of big crops. And big crops in a big price year, such as 1919 now promises to be, mean real money to you.

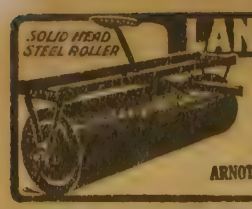
So why take needless risks by planting seeds other than those of proved quality, germination and vitality, and trueness-to-name?

Take Morse's Seeds for example. Their quality is the result of our 45 years of seed growing experience on our California seed farms—the largest in the world.

Their vitality or germinating power is proved by actual soil tests so thorough as to exceed the requirements set by all pure seed laws.

Their trueness-to-name or type is determined by *other* soil tests made under actual field conditions in special trial grounds.

Every one of Morse's Seeds—field, vegetable or flower—is pure-bred and pedigreed.



Whatever your seed requirements, Morse can fill them. Write or wire for prices by the pound, 100 pounds, or ton. Ask for our 1919 Garden Guide. It tells you all about all our seeds—and it's *free!*

H. P.—10 on drawbar. 20 on belt pulley.
NORMAL DRAWBAR PULL—3,200 pounds.
TOTAL LENGTH—118 inches.
TOTAL WIDTH—63 inches.
TOTAL HEIGHT—52 inches.
WEIGHT—4,200 lbs.
MOTOR—Galloway—4-cyl., 4¼-inch bore, and 5½-inch stroke. High duty. Slow speed.
SPEED OF MOTOR—900 R. P. M.
MOTOR BEARINGS—Very large. All are bronze backed, babbitt lined.
GOVERNOR—Galloway. Enclosed fly ball running in oil and on ball bearings.
FUEL—Distillate, Kerosene or Gasoline.
CARBURETOR—Holley, 1¼-inch.
FUEL TANKS—One 15-gal. and one auxiliary tank of one gallon capacity.
AIR CLEANER—Bennett dry air.
RADIATOR—Perfex, 8-gal. capacity.
WATER PUMP—Centrifugal, 450 R. P. M.
COOLING FAN—Oakes. High duty.
IGNITION—Dixie high tension—impulse starter.
CLUTCH—Borg and Beck, dry plate.
TRANSMISSION—Enclosed sliding gear, three speeds forward, one reverse; gears high-speed steel.
SPEED—Low, 1½ M. P. H. Int., 2¾ to 3 M. P. H. High, 6 M. P. H.
REAR AXLE—Full floating worm drive.
DRIVE WHEELS—Height 40 inches. Face 10 inches.
BEARINGS — Rear axle, Timken throughout. Transmission, Hyatt high duty. Front axle, Timken.
BELT PULLEY—8-inch diameter, 8-inch face, 900 R. P. M.
SUSPENSION—Three-point, mounted on spring in front to take all shocks.
WHEEL BASE—78 inches.
TURNING RADIUS—10½ feet.
DRAWBAR—Special design for California; very wide; roller hitch can be used if desired.
STEERING GEAR—Gemmer irreversible, with 18 inch hand wheel. Spark and throttle control levers directly under wheel.
DRIVER'S SEAT—Situated on right of tractor; very convenient position for watching tools and work.

green pod stringless is Burger's Green Pod Stringless. Scarlet Runner is a good standard variety having large green pods. Lima beans rarely do well in Northern California. One more important bean of the dwarf type is the Small White Tepary, a useful bean for dry territory. It yields heavily and is now well known in the market as a dry shell bean and should be grown in every home garden.

Soya Beans

This bean, largely grown in the orient and of recent years in many parts of the tropics, has been grown recently in California. It is rich in nitrogen and can be grown as green fodder or for the silo. The beans yield an excellent flour which is now on the market and has been used as a wheat substitute. Furthermore an oil has been extracted from the bean. They may be used in soups, etc., and are adapted to home garden requirements. Sow as directed for dwarf bean culture and make the first sowing about the middle of the month.

Celery

Complete the sowing of this crop for fall and winter use and also preparation of the trenches for planting out.

Beets

Sow Improved Blood Turnip beet or Long Smooth Dark Blood in soil which has been richly manured.

VEGETABLE PLANTING CALENDAR FOR APRIL IN SOUTHERN CALIFORNIA

By D. F. Reichard

THE rains of the past month have put the ground in excellent condition for gardening and now the warm days coming will heat the soil and cause all vegetation to grow in leaps and bounds. It will be necessary to keep the moisture where young plants can easily get it. This is attained by keeping the surface well mulched with the cultivator, or if your soil is one that is porous and dries out quickly irrigation will have to be resorted to if timely rains do not occur. Always be sure to work up your ground well as soon after each irrigation or rain as it can be handled without making it clod. Above all things keep the weeds down as they drink more water and take up more good plant food than one would realize.

Planting for April extends over almost the whole list of vegetables, the exceptions being peas and potatoes. On account of the lack of humidity and warm weather peas do not do well in Southern California generally when planted after the first of April. Potatoes planted after the middle of April fail to develop properly.

It is safe in all sections to plant all the more tender varieties such as beans, corn, cucumbers, melons, squash, and the plants of peppers, tomatoes, egg plant and sweet potatoes.

CAN YOU BEAT IT!

Lawyers seem to get most out of the law. As Rodger Dolan says: "I'd rather be the lawyer of an estate than one of the heirs."

The other day a butcher of Mount Vernon, Ohio, walked into a law office and put this question to an attorney: "If a dog comes into my shop and steals a hunk of meat can I make the owner of the dog pay for it?"

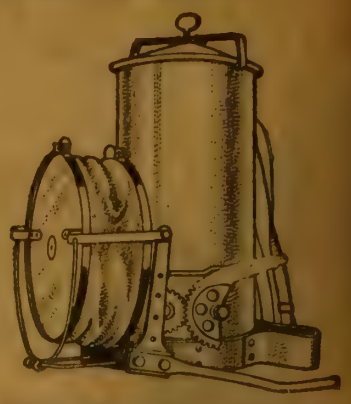
"Why, yes, certainly," said the lawyer.

"Well, then," said the butcher, "give me five dollars, for it was your dog."

The lawyer promptly complied.

A few days later the butcher got a bill of five dollars for legal advice rendered in the dog case, and which he promptly and good naturedly paid.

The butcher was out the price of the meat.



The lawyer was out nothing.

CHANGED HIS COLOR

"Don't you know I tol' yo' not to go swimmin' wid no white trash chillun, eh?" sternly asked Sambo Johnsing.

"But he wa'n'a white before he went in," replied Sambo's small son.—Boy's Life.

WATCH FOR POTATO WART

Wart, one of the most dangerous diseases of potatoes which has made its appearance in the United States, exists only in a limited section of Pennsylvania, according to the latest information obtained by the United States department of agriculture. The infested territory embraces 27 comparatively small mining towns. But experts of the department have given warning that the infestation may have reached other sections in the same way that it reached the Pennsylvania mining towns, and vigilance is urged to discover and report it, if it does exist elsewhere, as well as to guard against a possible spread of infestation.

The wart disease is thought to have been brought to Pennsylvania in 1912 in potatoes imported from Europe. The potato crop in the United States was short that year, and European potatoes are known to have gone to Pennsylvania and other places over the country where there was demand for a cheap supply. The discovery of the disease in Pennsylvania was made only last year and there is a possibility that it may be present but not yet recognized in other places.

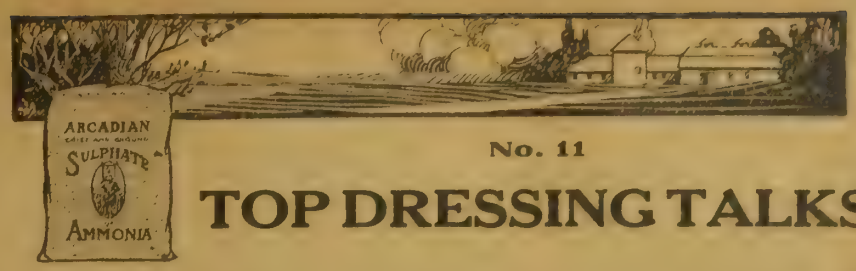
Wart disease is caused by a parasitic fungus and manifests itself by warty outgrowths on the underground portions of the plant. The warts vary in size, and sometimes the entire tuber is converted into a spongy, warty mass. Many of the warted potatoes rot in the ground, but if the warts are small and the season favorable, the diseased tissues may dry down and the tubers keep through the winter.

Damage resulting from wart varies, but it is always severe and in some cases no edible potatoes at all can be grown. This was true in many of the Pennsylvania gardens last year. The fungus is carried over from year to year not only in the potato but in the soil. If the same ground is planted to potatoes year after year, the infestation becomes so severe that the growing of potatoes is rendered impossible. Where long-time rotation is practiced, comparatively little damage is done.

Once the fungus is established in the soil, there is no means of eradicating it except by preventing the growth of potatoes on the infested ground, and it is known to be able to retain its vitality through a period of at least eight years.

"Immune" Varieties Abroad

Potatoes can be successfully grown on badly infested soil only by the use of resistant varieties. While nothing has been done in this country toward the development of such varieties, some of the European countries which have been ravaged by the disease were forced to undertake it several years ago. A considerable measure of success has been attained, the English and Scotch authorities going so far as to refer to some of their varieties as immune. The English government last year contracted for the growing of 1,000 acres of "immune" potatoes in Scotland, the seed from which will be available this spring.



STATE FORESTER

A great fund of information as to California forest resources is given in the seventh biennial report of the state forester of California. The first remark in the book is rather surprising in this that it states that California makes no appropriation for controlling the many fires which annually destroy grain, range and timber. The federal government maintains a system of forest patrol and various counties make small appropriations and volunteer departments aid in fire control in many communities, but the state should aid in this work to protect its own interests. Ordinarily the season is very short, from May 15 to October 15.

The officers are G. M. Homans, state forester; M. B. Pratt, deputy; Messrs. Schooler and Hunter, assistants, and W. J. Moody, secretary. This report is a book of something over 100 pages and is worth preserving in any library.

A "Better Fruit Drive" is soon to be started by the Florida college of agriculture, aided by progressive growers over the state.

Citrus fruit growers of the Murray Valley, South Australia, have formed a cooperative marketing association.

No. 11

TOP DRESSING TALKS

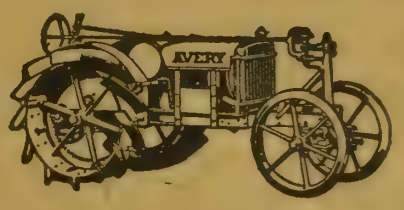
ARCADIAN Sulphate of Ammonia supplies quick-acting nitrogen. Does it afford any other element of plant food? Yes, it contains sulphur, which is highly beneficial on certain soils. Experiment stations have shown that sulphur plays a more important part in plant growth than was previously conceded. Work conducted by Prof. C. B. Lipman and W. F. Gericke is summed up in the following:

> "The superiority of Sulphate of Ammonia over other readily available nitrogenous fertilizers, for barley on the Oakley blow sand as demonstrated in early experiments, is confirmed in a new series of tests."

The cause of such superiority of Sulphate of Ammonia was sought for, and believed to be the sulphur content.

Arcadian Sulphate of Ammonia

ARCADIAN Sulphate of Ammonia is the well-known standard article that has done you good service in your mixed fertilizers for years past. Especially kiln-dried and ground to make it fine and dry. Ammonia 25¼ per cent. Made in U. S. A.



The Great American Ammoniate

Costs Less To Buy

Costs Less To Operate

Avery 5-10 H.P. Special Orchard Tractor

Avery Tractors

(MADE IN SEVEN SIZES)

If You Own and Are Farming---

From 5 to 40 acres of ORCHARD, and do not already own one of the small AVERY Tractors you certainly owe it to yourself to investigate this wonderful little Orchard Tractor for yourself and find out how economically Avery owners are doing their work.

It Will Do---

What you could formerly do with FOUR HORSES,—Only weighs as much as two horses—Less than half as high as one horse, and costs less than half to operate and maintain in repair, than it does to feed one horse the same length of time.

You Can Do---

EVERYTHING there is to be done on your ranch.—Plow, double disc, harrow, cultivate, make your irrigation furrows, and then haul your fruit to the packing house.

It Is Equipped With---

A 4-cyl. motor, extra heavy crank shaft, and connecting rods, enclosed governor, K. W. High Tension Magneto, three speed selective type transmission, equipped with Hyatt roller bearings, DUST PROOF. VERY LOW—45 in. Turns very short,—out of one row right into the next. COME IN AND LET US DEMONSTRATE TO YOU.

The Day of the Pure Bred Bull

By R. P. Royce

NOT long ago a cattleman who was visiting this state for the first time remarked that while he found that the top herds of pure bred cattle compared very favorably with the better herds in other sections of the country he was impressed with the rather inferior quality of our range cattle and stated that for the most part they did not show that they had had the advantage of good bulls.

The same observation has been made by others, and there is a deal of fact in it. There is wide room for improvement in our cattle, and this improvement must come if many outfits continue in the business. There are too many cattle operators "asleep at the switch." Too many are running their outfits as they did 25 or 30 years ago and have failed to keep step with the march of time. Too many still insist that "$150 is enough for any bull." Most of these men pride themselves that they are "practical cowmen." We wonder if they are as practical as they imagine themselves to be.

It is rather poor form to remark that times have changed—the fact is too obvious — but nevertheless they have. The good old days of vast herds of Spanish cattle grazing on California hills have gone. In those days beef could be produced very cheaply, labor wasn't a factor, the investment in cattle and land proportionately low and the question of better bulls wasn't a very vital one in the old cowman's scheme of operating. It's different now. Every item that enters into cattle production has increased to a point where it requires careful figuring to really show a profit. Most outfits have progressed — to a degree. There is still much to be accomplished in range control. They have instituted better methods of counting, grading, marketing and disease control. The majority have come to appreciate the value of a full calf crop and have accordingly put out more bulls with their cow herds. The big thing that most have overlooked is the certain possibility of improving their stuff by the use of good bulls. The bull factor in their operations has been—if not discounted — neglected. To many a bull is a bull; to others a bull is a bull—if he is red—and the price is right!—say $100 to $150.

Here, then, exists a strange situation. The most potent factor in improving a herd of cattle, and thereby increasing the profit, is a bull. Bulls are the basic units of herd improvement. It makes no difference how well bred the cow herd might be, the quality and value of the calf crop depends on bulls to a greater extent than any other factor. One does not have to go far afield to prove that statement.

The very fact that most of these "practical" cowmen, when in the market for bulls, insist on a "high grade" is an acknowledgment on their part that breeding does count. A "high grade" bull is better than a plainer bred bull because of the fact that pure bred bulls are back of him. Following out this fact then—why not cut corners, so to speak, and put into your herd the kind of bulls that were responsible for the kind you buy? If your cow herd is better today than it was 10 or 15 years ago—what made it? Scrub bulls? It's better because you used bulls of stronger breeding than your original cows. There is no other explanation.

There is no sound argument against the pure bred bull. The most common argument heard relates to the cost, many cowmen claiming that they can not afford to pay over $100 to $150 for a bull (many will put in cheaper stuff), the chief consideration with them is to buy a bull as cheap as possible—figuring that the cheaper they buy the shrewder they are and consequently the more money they make. As a matter of fact, the cheaper they buy the more money they lose—when it comes to bulls!

There isn't a cowman in California but will admit that on the average the cattle stock of this state registers an improvement over the cattle of 30 years ago. What made them better? Well bred bulls! That fact can not be controverted. It must be admitted, and, if it is admitted, there is little ground left on which to stand when arguing against pure bred bulls.

Far be it from the writer to urge that range men buy $1000 bulls to turn on the range, but he does urge that they discard the old idea that a bull is a bull and adopt a policy of each year adding a better class of bulls, basing their selections on the real beef qualities of the bull rather than on how cheap they can buy. Get entirely away from the $100 to $150 idea. Seek out better bulls and be willing to pay a reasonable price. No one can very accurately set the value of a well bred bull. What is a few dollars—$25, $50 or even $100 or $200—difference in price, when it is certain that the better bull will add pounds to every steer sold, will increase the quality of the steer and reduce the age at which he is marketed?

Another thing—some cattlemen, alleged "practical," have an inborn prejudice against a bull "with papers"—the mere fact that he is registered and has "the papers" to them smacks of "fanciness." And because of their very "practical" natures they disdain to use a "fancy" bred bull. As a matter of fact a well bred bull, backed up by a good ancestry, is the most practical adjunct to a cow outfit. A practical thing is a profitable thing. A pure bred bull that will make one money ought certainly to be practical and not "fancy".

Many cowmen insist that our coast markets are such that the use of pure bred bulls is not encouraged. They claim, and it is undoubtedly true, that there is not a wide enough spread on our markets between the riff-raff and trash that finds its way to the killer and the stuff showing more quality and finish. They maintain that as long as buyers will take stuff of canner quality at a price almost equal to what is offered for cattle of quality that cowmen will continue to pay slight attention to the sort of bulls used.

These men may be right; perhaps they have reached the conclusion after practical observation, but the writer finds it difficult to agree for these reasons:

Granting that a thin-fleshed, light-dressing, thick-hided "hat-rack" will sell for nearly as much per pound as a better bred steer, this fact should be kept in mind—the better bred steer will reach the market at a younger age and go over the scales at a heavier weight. It would therefore appear that the man who raises the better sorts can market more pounds of beef at an earlier age than his less progressive neighbor and therefore has an advantage, even if he has to take about the same price.

But cattlemen in California can be certain that they will have a better market. The intolerable situation that exists now is not going to persist. Through the work of the California Cattlemen's Association the producers are being formed into an organization that will be strong enough to force a change in our present cumbersome marketing system — and that is one thing that they propose to do. In every live stock producing section of the country the question of better markets is a live and vital problem. Apparently, too, the United States government is about to take some action that will touch every market.

Cattlemen of California should adopt a more forward looking policy. The man who makes the greatest success is the man who looks far into the future and anticipates the correct trend of the times and orders his operations accordingly—he is the man who usually "arrives" about the same time new conditions develop.

Now is the time for a great many outfits to anticipate the time when our markets will be better and when increased cost of production will make necessary the adoption of every cost reducing factor.

Better bulls will be powerful factors in reducing the cost of production.

MAGNANIMOUS

One day little Flora was taken to have an aching tooth removed. That night, while she was saying her prayers, her mother was surprised to hear her say: "And forgive us our debts as we forgive our dentists."

Healthy Teats and Udder

HELP THE MILK FLOW

Have you ever noticed how the milk flow falls off if a cow is troubled with a diseased or irritated condition of the teats or udder?

You can save your cows all such annoyance and keep the milk production up to normal by keeping on hand constantly a package of *Bag Balm*, the great healing ointment. Its penetrating and healing properties are so prompt and positive that you need have no udder troubles in any of your cows.

Caked Bag is quickly relieved and eliminated by applying *Bag Balm*. Be sure to have a package on hand when cows freshen. Very valuable in treating Bunches, too.

Sold in liberal 60c packages by feed dealers and druggists.

BAG BALM
MADE BY THE KOW-KURE PEOPLE

Flush Cows After Calving

Protect your herd against Contagious Abortion and Barrenness.

Barrenness or Sterility, like Abortion; Retention of After-birth and Premature Birth, is nearly always caused by infection of the reproductive organs by the germs of Contagious Abortion. Unless this infection is promptly overcome by the use of a powerful but safe antiseptic, it may permanently affect the reproductive organs so that the cow will continually fail to stick.

Every time a cow drops a calf—whether alive or dead—by premature birth or aborting, whether the after-birth is retained or not, her reproductive organs should be flushed out, because that is where the infection is developing.

B-K, the powerful non-poisonous antiseptic, is scientifically correct for this work. Used as a douche for the uterus, it quickly brings the after-birth, dissolves the slimy albuminous matter, kills the germs, stops discharges and controls the infection. B-K does not cause straining, but is soothing and heals the tissues.

Send for "evidence" and free Bulletin No. 52 "Contagious Abortion." If your dealer does not have B-K send us his name

COMBINING POUNDS WITH QUALITY

By Frank D. Tomson

WHEN the feeder goes to market he finds that the premium prices are offered for the quality which his consignment may or may not carry. He observes a very considerable range between the values offered for the steers, or whatever the shipments represent, that have the something that is called quality, and those that lack this desirable possession. If he follows this up he will find that it is the presence of good breeding that has created this quality. He will find that the larger the percentage of good breeding the more evident the quality. The pure bred sire has played his part, and if there are several generations of pure bred sires of the pure bred standard the quality will be all the more pronounced.

Then there is the matter of weight that increases the cash return. This harks back to the pure bred sire also, and when this weight is combined with quality there is a double advantage to the seller as he receives more per pound and more pounds. It is frequently the case that all of the profit is wrapped up in these added pounds and the quality. Many a shipper has journeyed homeward minus a single dollar of profit, in fact often sustaining an actual loss, just for the lack of this quality and the extra pounds. It is an old story—and a true one.

There are times when a feeder can put in a load or more of inferior bred cattle and make a profit, but that is because he bought them low—too low for the producer's welfare. It is the producer who is chiefly concerned about the presence of quality and adequate weight. He is the one who profits when these are present and loses when they are lacking, and he is the one who can provide both. It is up to the producer to see that his standard corresponds with the requirements of the market. It costs money now to grow an animal to maturity. It costs money to finish an animal for the market whether as baby beef or at any older age. There must be a response on the part of the animal that will offset these increased costs. This responsiveness is only assured by an approach to the standard of the pure bred which comes through the continued use of pure bred sires. There is nothing theoretical about this. The lesson is taught every day on every important market. There is only one way to safeguard the producer and that is in the adoption of higher standards, and the nearer that standard approaches the pure bred type the more certain the profit of the grower.

Count the cost of things, Mr. Cattleman, that have a part in the maintenance of your herd and the finishing of your beeves. Whether it is feed, labor, land, or any other item—it is higher.

Not long ago a load of well bred Shorthorn steers sold on the open market at Chicago for $20.50 per hundred weight because they were well bred and adhered to the well bred type. Because of this they finished well. If these were marketed by their producer there is no denying that he had a considerable profit. Previous to that a load of two of Montana range bred steers went onto the Chicago market at $18, a record range price. They were by pure bred Shorthorn bulls and had both the weight and the quality desired. They both count. They are the sources of profit. It takes them both to make adequate returns. It calls for the pure bred bull that will supply both.

BEEF CATTLE FOR VALLEY FARMS

By W. S. Guilford

THE good valley and foothill pastures of the Sacramento Valley have produced excellent grass beef ever since the settlement of California. A number of wealthy outfits own pastures in the hills which they use in winter and in the lower lands subject to overflow in winter but which afford excellent summer feed. Some of these concerns own beef cattle herds that are of exceptional excellence, the Henry Compton herd for instance. This herd has been bred for nearly 40 years under one management. The animals are all reds and as uniform as peas. The foundation stock was red Shorthorns, and some Devons have been used during the past few years.

These big pastures in the hills, with the stubble feed and valley pastures to supplement them, will always produce large quantities of high class beef.

Just how much will the production of beef be increased on the smaller farms in the valley?

There are many grain farmers who are planting alfalfa on a part of their lands and who could easily grow corn for silage. These men do not take kindly to dairying but they could easily grow one or more carloads of baby beef every year. They have stubble and volunteer feed for the cows and calves during a part of the year and this would need to be supplemented a part of the time with silage and alfalfa, but the whole situation could be handled with comparatively small labor cost.

Then dairy Shorthorns for the small irrigated farms are growing in favor. Good red or roan cows that will milk pretty well and produce a calf that will make good beef appeal to many who grow some alfalfa, a few sheep and hogs and have some orchard trees coming on.

For this same situation Hon. E. H. Grubb believes the Lincoln Red cow, a big dual purpose animal that has been popular in England for years, will some day be used. He hopes to see some of these imported next year.

Another big factor in the beef cattle situation in the Sacramento Valley will be the comparatively large number of herds of registered cattle maintained to supply bulls for the range herds.

The men who grow beef on the ranges and big pastures of Northern California are big progressive people; they know the value of good blood and are willing to pay for it.

A lot of good herds are being established in the Sacramento Valley, and more will follow.

And all of them will be needed to supply the demand that now exists for high class bulls.

SHORTHORN SALE

For the Shorthorn sale to be held at Davis on the afternoon of April 8, at which Auctioneer Reppert will preside, there are in all 48 entries, 24 cows and heifers and 24 bulls.

The well known Pacheco Cattle Company has entered five bulls bred by them and all sired by the splendid bull True Dale, by Double Dale, by Avon Dale.

The University of California will sell a bull and heifer, both sired by Sultan Mayflower, he by Sultan Stamp, by Whitehall Sultan. The name of the bull calf is California Model and his dam the wonderful cow which produced the great steer, California Favorite.

A granddaughter of Villager has been entered by the Jack London Estate of Glen Ellen, which is also putting in their herd bull, Roselawn Choice. A great opportunity is afforded anyone desiring a herd header in the offer of this fine animal. There are also two heifers by Roselawn

Why does Swift & Company sell poultry, eggs, and butter?

For the same reason, Mr. Farmer, that your R. F. D. postman now brings your packages as well as your letters.

He used to bring only letters; but since he makes his rounds every day and has the necessary rig or "flivver," Uncle Sam decided to use more fully his time and equipment by handling parcels.

Years ago Swift & Company built up a nation-wide distributing organization, including thousands of refrigerator cars and hundreds of branch houses with refrigerator equipment, for the marketing of meats. And none of this equipment was being used to maximum capacity.

What more natural than that Swift & Company should take on other perishable products, such as poultry, butter, and eggs?

Also—those products are sold by the same salesmen that sell our meats; they are hauled in the same delivery wagons; the same clerks make out the bills; and they go to the same class of retail dealers.

Also—these retailers are equipped to handle perishable products and want to be able to buy poultry, butter, and eggs, of us. And consumers like to buy them from the same retailer that sells meat.

As a result, our vast organization is more economically utilized—and at the same time we render a valuable service to you, Mr. Farmer.

We make the cash market for your poultry, butter, and eggs more steady.

We broaden the outlet for your goods, because our organization reaches every important consuming center in the country.

Swift & Company, U. S. A.

Established 1868

A nation-wide organization owned by more than 25,000 stockholders

Guaranteed break-proof

Don't waste your time tinkering with a plug that goes out of business with a broken porcelain.

Splitdorf plugs are guaranteed not to break—The Green Jacket can be broken and we'll replace any that may be smashed—but Splitdorf Plugs continue to fire regardless of Jacket condition.

Why? Just look at the illustration. Thin sheets of India ruby mica are wound lengthwise around a core-shaped electrode. This forms the insulation of Splitdorf Plugs and you can't break it.

Although Splitdorf Plugs cost the manufacturer more than any other plug they'll cost YOU no more than the ordinary plug. All Splitdorf Standard Plugs, except Specials, $1.00 (In Canada $1.25.)

There is a type of Splitdorf Plug best suited to every engine. Our booklet will tell you the exactly right type for YOUR engine. Write for it TODAY.

Mfg. by Z. A. MACABEE, Los Gatos, Cal.

Choice 81st and a choicely bred Crookshank animal by Selection.

Oxford is a bull calf sired by Royal Silver, 387283, out of Maud 2nd, consigned by T. T. Miller, who now maintains his herd at Hollister.

E. H. and H. L. Murphy of Perkins are putting in the sale Holden Boy 497945. This bull was calved September 1915 and is sired by Allaraine out of Golden Girl.

In succeeding issues a description will be given of the other entries.

The ever growing interest among cattlemen of the state, both in quality of cattle and breeding, warrants their attention at this sale.

At the present prices for beef the old time prejudice against paying a reasonable price for a worthy animal has disappeared and it is acknowledged among cattlemen that the better the parent the more profitable the offspring.

GUARANTY SALE

Continued from Page 473

King Abbekerk Johanna Segis, consigned by Bridgford Co., Knightsen. This bull was sired by King Segis Alcartra Abbekerk and out of the highest record cow (41.03 pounds butter) on the Pacific Coast, Adirondac Wietske Dairy Maid. All day the crowd had anxiously awaited his appearance in the ring and the moment he was led in, one might have heard a pin drop on the tan bark. What would he bring? Finally, after the crowd composed themselves, he was started at $1500. Gradually he was sent to $2000. $2500, $3000, $3500, and finally Mitchell outlasted his competing bidders and at $5000 became the owner of the highest record bull on the Pacific Coast.

Other sensational prices happened with such regularity that they became rather commonplace. For some time the heifer Korndyke Model Hartog 3d, consigned by Albert E. Smith of Sumas, Washington, and purchased by Toyon Farm Association, Los Altos, for $2600, stood as the top female, but when King Hengerveld Honriette, a 30 pound senior four year old granddaughter of old Hengerveld De Kol, out of Honriette Wayne, consigned by A. W. Morris & Sons of Woodland, came in the most spirited bidding of the day occurred and was not stopped until she became the property of E. D. Barry, Jr., of Daggett at $4000—$900 more than the top cow in the 1917 sale.

Barry made his initial purchases at the 1917 Guaranty Sale when he secured two daughters of Prince Gelsche Walker at $1400 each and one daughter of King Mead of Riverside. In this sale he secured three daughters and a grandson of Prince Gelsche Walker. Incidentally, he was the runner up on the second highest priced female.

Toyon Farm Association made a rare selection when they secured Nos. 1, 2 and 3—Ava Model Hengerveld 2d, a 30 pound cow, her daughter, Ava Hartog Pieterje, and her granddaughter, Korndyke Model Hertog 3d. The family cost $6100. They also selected Princess Jonge Buckeye, 24.9 pounds butter, at $1000, and beautiful heifer Ruby Pierterje of Forrest Hill 2d, bred to the $106.000 bull, Carnation King Sylvia, at $2250.

The Carnation Stock Farms, Seattle, secured the great 37.5 pound Bridgford cow, Boweda, at $2400; the 32.4 pound Sarah Topsy De Kol, from the same herd at $1400, and Stratford Segis Blanche De Kol, 30.54 pound daughter of Sir Segis Hengerveld De Kol, consigned by A. J. Stalder, Riverside.

J. E. Peck, Calexico, was one of the best buyers at the sale, selecting five head at a total of $4800. Included in the Peck buys was the 27.8 pound Jessie Hengerveld Johanna from the Smith herd and bred to Carnation King Sylvia, and Miss Pontiac Nudine of Springvale, a 31 pound cow from the McAlister herd.

The top 10 head averaged $2040, seven bringing over $2000. Six bulls averaged $1600 and the 55 head of females averaged $992.

The complete list of sales follows:

Albert C. Smith, Sumas, Washington.

1. Ava Model Hengerveld 2d, Oct., 1911, 30.53 pounds. Toyon Farms Association, Los Altos; $2050.
2. Ava Hartog Pieterje, Jan., 1917, Toyon Farms; $1450.
3. Korndyke Model Hartog 3d, Jan., 1917, Toyon Farms; $2600.
4. De Kol Butter Boy Belle 2d, Oct., 1911, 28.09 pounds; H. J. Long, Mason, Nevada; $975.

4½. Calf, 1919, Toyon Farms, $325.

ORLAND JERSEY BREEDERS' ANNUAL MEETING

The annual meeting of the Orland Jersey Cattle Club was held in Orland the evening of March 26.

Following the election of officers Dr. H. W. Hand, president of the state association, delivered an address on the high producing qualities of Jerseys, illustrating his talk by colored slides.

During the doctor's remarks he stated it was the duty of every Jersey breeder to try and place a registered bull at the head of any grade herd in the community even if it was necessary to make a discount on the price of the animal.

He also stated he was willing to do this at any time and hoped other breeders would do likewise, as this would soon convince the owner of grades of the wisdom of adopting pure breds.

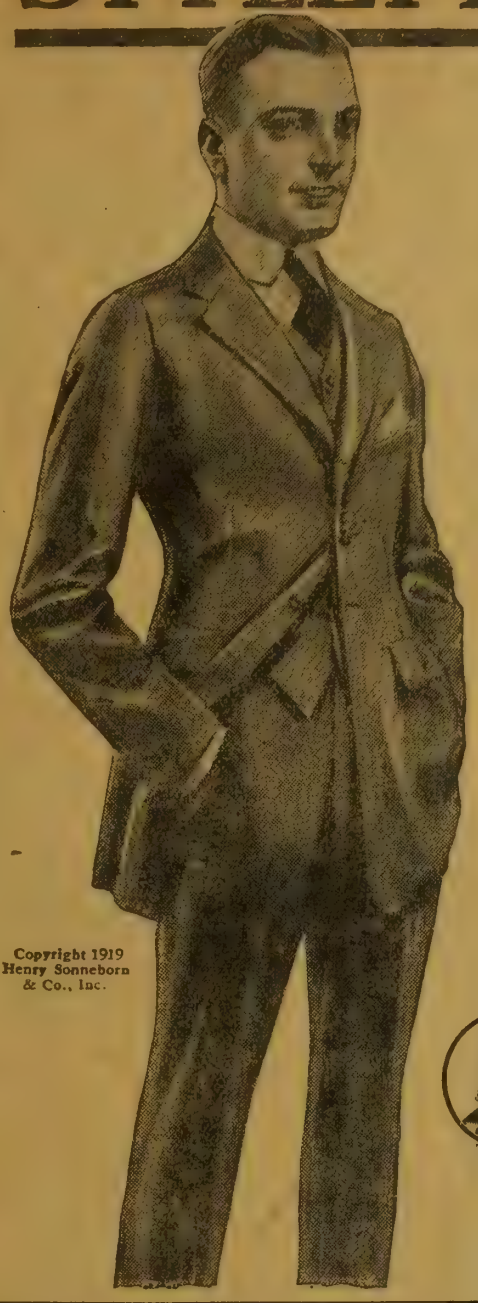
Prof. E. C. Voorhies of the state university gave a very interesting talk on the Jersey, its possibilities in this state and the opportunities offered breeders. He called special attention to the success obtained in other communities where the breeding operations were confined to the same blood lines as much as possible.

H. West of Scappoose, Oregon, who has been breeding Jerseys for 30 years, spoke briefly regarding some of his importations.

At the conclusion of the program light refreshments were served by the lady members of the club. The following officers were elected for the ensuing year: President, D. Nickel; vice president, C. A. Whitsett; secretary, Mrs. Nickel; treasurer, A. J. Morly.

ANCHORAGE BERKSHIRE SALES

Mrs. Ruth Hardy of Anchorage Farms, Orland, writes that since March 1 the following fine list of sales has been made. Practically all of the sales represent the blood of the noted boar Star Leader and indicate the esteem accorded him by buyers. The sales follow:



George P. Upham, Martinez, one daughter of Star Leader and one bred gilt; M. G. Algots, Los Angeles, four bred gilts, two bred to sons of Star Leader, one to a son of Ames Rival 70th, and one to a son of Baron Duke 261; D. D. Wilson, Loomis, two bred gilts; H. Tracy, Corning, four mature sows and a son of Star Leader; F. Fuller, Taylorville, one sow pig; Wm. M. Walsh, two bred gilts, bred to a son of Star Leader; Mr. Ondres, Orland, one young boar; M. Morey, Orland, two bred gilts and one sow pig; R. Ryerson, Holtville, one boar pig, grandson of Star Leader; C. K. Robinson, Sacramento, a daughter of Star Leader; Pig Club, Redding, three sow pigs; E. N. Eibe, Glenn, two bred sows; M. Fortini, Orland, one bred gilt; J. F. Nahas, Merced, one bred gilt and one sow pig; Gee Brothers, Corning, two bred gilts; Long & Sons, Nevada City, two bred gilts; Joseph Gassoway, Grass Valley, one bred gilt; G. R. Holcomb Estate Company, Reno, Nevada, one bred gilt; Glenn Pettay, Redding, one boar pig.

Slocum Buying Top Durocs

In a letter written from Cincinnati, Ohio, Clayton N. Slocum, junior member of the Duroc breeding, establishment, H. P. Slocum & Son, Willows, says: "I am seeing a lot of good Durocs on this trip. I have visited the leading herds in Nebraska, Kentucky and Ohio. I find prices ruling very high on the kind of stuff I want, but I am determined to get some of the best for California. Among my selections to date are four gilts from the Ira Jackson herd. A brother to these gilts sold for $7500. Last week I bought a litter mate to Mammoth Sensation, a boar that the owners have refused to sell for $10,000. My new boar is a half brother to Great Sensation, which his owner, Ed M. Kern of Nebraska, values at $50,000.

"Before returning home I expect to visit herds in Michigan, Illinois, Iowa and Missouri and I believe that with the stuff I intend to buy we will have the best lot of herd boars on the Pacific Coast. We will have the blood lines that will put California on the map."

STYLEPLUS CLOTHES

Copyright 1919 Henry Sonneborn & Co., Inc.

You know they are worth their price!

You know Styleplus Clothes are stylish because they are worn the nation over.

You know they have the right quality, because thousands of America's well-dressed men buy them regularly every season.

Styleplus Clothes are guaranteed. They are made of the kind of goods that stand up under wear and yet keep their good appearance.

Our special manufacturing method (concentration of volume) makes possible such exceptional values at medium prices.

It pays to buy your clothes at a store—where you can *see* and *try on* the clothes before you buy them. At the Styleplus Store you get *known* quality at *known* prices.

Sold by one leading clothing merchant in most cities and towns. Write us (Dept. AB) for Styleplus booklet and name of local dealer.

Notes on the Hereford Sale University Farm, April 9

For the second annual sale under the auspices of the Pacific Coast Hereford Breeders' Association, eight herds have been drawn on for 80 head, consisting of 58 females and 26 bulls. The offering as a whole is easily the choicest collection of Herefords ever assembled for sale on the Coast and will afford a rare opportunity for the established breeder, the beginner and the range man to make selections that will add strength to their herds.

The Herefords have won their way to popularity on sheer merit alone. In the early days of the breed in this country every possible obstacle was thrown against them and at times their supporters had to literally fight for recognition. Gradually the inherent merits of the breed were demonstrated and the movement to the great ranges set in. There has never been a halt. Each year more territory was invaded and the ground captured was held. Gradually the great herds of cattle throughout the West and Southwest began to show white faces. Today every range section has its Herefords and all cattlemen — even the supporters of other breeds — stand ready to acknowledge the beef making qualities of the breed, and to admit that under many conditions the Hereford is the range breed par excellence. California has not always been regarded as a Hereford stronghold, but in recent years a number of excellent herds have been established and there is a growing interest in the breed. It is expected that the approaching sale will develop more interest and result in the establishment of several new herds.

Part of the offering has been selected with special regard to the need of the range man.

One of the largest consignments comes from the Nevada herd of J. H. Cazier & Sons, Wells. This firm maintains one of the best known herds in the West. Their herd was established in 1904 on a foundation secured from the famous Alamo herd of the late Governor Sparks of Nevada, the Halleck Land and Cattle Company and the Hereford Corporation of Wyoming. For the past several years the chief herd bulls in service have been Harris Standard 2nd, a grandson of Bonnie Brae 8th out of a Distributor dam; and Debonair 64th, by Debonair 26th, by Debonair, and out of a granddaughter of Beau Donald. Within the month one of the best bulls of the breed has been installed at the head of the herd. This bull, Beau Blanchard 76th, was purchased from Jesse Engle & Sons, Sheridan, Missouri, for $10,000. He was calved October 6, 1917, and was sired by the noted Beau Blanchard, counted one of the strongest breeding bulls of the present day, and is out of Petrolea 12th by Domino, second dam by Beau Donorous, third dam by Militant and fourth dam by Beau Brummel.

Beau Blanchard 76th headed the second prize young herd at Kansas City last fall. The bringing of this bull to Nevada will mean much to the Hereford interests of California and it is to be hoped that some of the progressive breeders of this state will be as enterprising.

The 22 females, with the possible exception of one heifer, are bred or will have calves at foot to the service of Harris Standard 2nd, Debonair 64th, or Mystic Debonair, a son of Debonair 26th. Among the list are two daughters of McCord by Precursor.

The seven bulls include the three year old Mystic Debonair; an 18 months old son of Beau Perfection by Perfection, the sire of the famous Woodford and Perfection Fairfax. Five yearling bulls, all by Harris Standard 2nd, will sell.

W. D. Duke, whose Alamo herd of Herefords on his ranch near Likely is one of the largest in California, is sending forward 25 head, nine bulls and 16 females.

The Duke herd is founded almost entirely on Sparks breeding. In this connection it might be well to state that the old Alamo herd of Governor Sparks was counted one of the top collections in the West and probably exerted as wide influence on the cattle of the West as any herd.

Twelve of the Duke females are just turning two and most of them are bred to Alamo Reuben, the top bull, $1350, in the 1918 Davis sale. He is a son of Harris Standard 2d, and his dam is Rubena 22d, a daughter of the imported bull Rufus.

Valley Pastures are Rich

Pure bred Hereford bulls from this herd were recently shipped to the Hawaiian Islands. This is part of the breeding herd maintained by H. H. Gable, president Pacific Coast Hereford Breeders' Association.

Five of the bulls, junior yearlings, are out of Mr. Perfection dams and are sired by Picador, a grandson of Peerless Wilton, out of a Hesiod dam, or by Gus, a son of Mr. Perfection out of a Beau Donald 31st dam. Two heifers are by Gus and out of Beau Dale 2d dams. A senior yearling by a son of Mr. Perfection out of a Beau Dale 2nd dam, and a two year old by Majestic Folly, a son of Young Beau Brummel, are also catalogued.

W. J. Bemmerly of Woodland, who has just returned from a tour of Eastern Hereford establishments, is contributing 11 head, consisting of ten females and one bull.

Four of the females, three junior yearlings and a senior yearling, are sired by the Chandler bred bull, New Era 2nd, a son of Debonair out of a Beau Donald 33d dam. The dams of these heifers are by Mr. Perfection by Perfection 2nd, a full brother to the sire of Perfection Fairfax, and Woodford, and by Beau Donald 31st, one of the good breeding sons of the famous Beau Donald. Three heifers are by Mr. Perfection out of Beau Donald 31st dams. Bemmerly is also selling a young junior yearling heifer by Panama 33d by Cuba's Panama, the bull that has been responsible for so many of the good Herefords shown by A. B. Cook of Montana; a junior yearling heifer by Beau Donald 103d, a son of Beau Donald and out of a Beau Donald 40th dam, and the coming three year old cow by Maxwell out of Lady Barendo 190th. The bull from this herd is a junior yearling by New Era 2d, out of Mollie Hope by Beau Donald 31st, second dam Bright Hope by Lord Prettyface. Bright Hope was grand champion at the Lewis and Clark exposition and was never defeated.

The one of strictly bull consignments comes from Chas. Rule, Jenner, who is consigning seven head that in point of good breeding rank with the best to be sold. All are junior yearlings. Five are sired by Sonoma by Beau Perfection 9th by Perfection. The dam of Sonoma was Elvira by Romulus by Militant. The dams of two of the Sonoma bulls were by Beau Picture, a son of Beau President; one by Bright Stanway, one of the really good bulls of the breed

Shear the Modern Way

You wouldn't allow 15 per cent of any crop to go unharvested. So why stick to old-time methods of sheep and goat shearing? Shear the modern way, with a Stewart Machine. Gets more wool easier and more quickly. These are hand operated machines and larger ones. Price of Stewart No. 9 only $14. Send $2—pay balance on arrival. Write for catalog.

CHICAGO FLEXIBLE SHAFT COMPANY
Dept. B 101, 12th St. and Central Ave., Chicago, Ill.

one is by Simoon 5th, a grandson of Simoon; one is by Beau Randolph by Beau President. Two bulls are by Simoon 5th, referred to above—out of dams by Beau Picture and Beau Dandy by Beau Brummel.

H. M. Barngrover of Santa Clara, proprietor of the Veramont Stock Farm in Plumas County, will sell two cows and four bulls. It will be recalled that Barngrover recently purchased the bull Don Woodford 4th from Walter L. Yost of Kansas City, to assist his herd sire, Patrician 5th. Patrician 5th is an extremely well bred bull. He was sired by Patrician 4th by Paragon 12th. Paragon 12th was the bull that made the W. A. Dallmeyer herd in Missouri famous. Last year Paragon 12th was sold at a long price to the Parker Ranch in Hawaii. The dam of Patrician 5th was A Plum Erling by the great Lord Erling out of Armour Plum. With two such well bred bulls it is expected that the Vermont Herefords will be factors in the development of the breed on this coast. Four of the bulls listed, three senior yearlings and a junior yearling, are by Patrician 5th and are out of some of the best cows in the herd.

The two cows, both by Mr. Perfection, one out of a Beau Donald 31st dam, the other out of a Columbia cow, will prove attractions.

John A. Bunting of Mission San Jose is putting in only one entry—a two year old heifer. Bunting says that he is too anxious to build his herd up to sizeable proportions to go into his herd any deeper. She carries the service of California Prince Donald, grand champion at the 1918 California State Fair.

Mrs. D. O. Lively of San Francisco is the only woman consignor. She is selling a two year old heifer by Majestic Folly out of a dam by Mr. Perfection.

The University of California will sell the aged bull, Hopeful Prince 2nd. He is by Prince Lad 11th by Prime Lad 9th, and his dam is Bright Hope, an undefeated daughter of Lord Prettyface and counted one of the best cows on the Coast today.

Hopeful Prince 2nd was reserve champion at the P. P. I. E. and is a half brother to the grand champion steer of 1916.

EASTERN POLLED HEREFORDS TO SELL AT SACRAMENTO

April 10, the day following the Pacific Coast Hereford Breeders Association sale at the University Farm, Davis, the American Polled Hereford Breeders' Association will hold their first California "Breed Promotion" sale at the State Fair Grounds, Sacramento. This sale is one of a series that the association is holding this spring throughout the country and has as its object the advertising of the Polled Hereford.

Polled Herefords are a comparatively new development. They are true Herefords and the breed was really started when Warren Gammon, father of the present secretary, made inquiry among Hereford breeders as to whether they had any naturally polled calves in their herds. Polled calves were not unheard of, as from time to time naturally hornless calves appeared in various herds. He was successful in locating a few of both sexes and from that start the breed has been built up and has made considerable progress. During the past few years some highly satisfactory animals have been developed.

The sale at Sacramento will consist of 25 head of carefully selected bulls and females from the herds of the following consignors:

J. E. and Geo. Kirstin, Clarion, Iowa; Kerr Bros., Muscatine, Iowa; Harry Smith, Arcadia, Iowa; Fred Reppert, Decatur, Indiana; H. L. Schooley, West Liberty, Iowa; S. F. Haley, Tiskilwa, Illinois; D. O. Eddy, Wesington Springs, South Dakota; C. E. Brown, Rushville, Illinois; N. M. Leonard, Waukee, Iowa; H. B. Thomsfeldt, Lamars, Iowa; Hodgson Bros., Ottawa, Illinois; G. E. Pettigrew & Sons, Flandreau, South Dakota, and W. T. Nolin, Milford, Illinois.

The sale will be managed by B. O. Gammon and H. L. Schooley. Fred Reppert will be the auctioneer.

Lactein

What Is Lactein?

Lactein is a scientific condensed milk product for poultry and hogs. Made from pure buttermilk and whey, by our own process which retains all the health giving food values and a uniform acidity without the useless bulk of water.

Largest Poultry Farm in the World Recommends Lactein

Corless Bros., Mammoth Poultry Farm of thirty thousand laying hens and now making elaborate preparations for an additional twenty thousand more, and by far the largest poultry farm in the world, says:

"We have used Lactein and we are satisfied that it is a first class article, a fine tonic and egg producer. For baby chicks we consider the feeding of Lactein indispensable. You may refer anybody to us and we will heartily recommend Lactein."

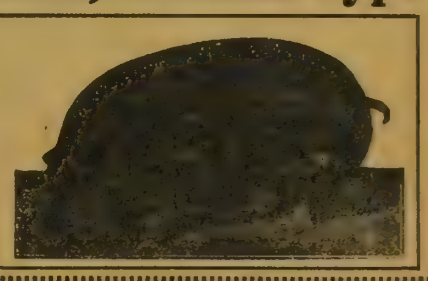
Swine Breeders' Association Recommends Lactein For Hogs

A resolution urging every resident in the county to "keep a pig" was adopted by the Stanislaus Duroc-Jersey Swine Breeders' Association yesterday afternoon. The action was taken in view of the appeal of the government to increase the supply of hogs.

The association also declared itself as favoring the use of Lactein, manufactured by the Lactein Company, for the feeding of hogs. Several directors who stated they had used the Lactein for hog feeding highly recommend its use.—Modesto Herald.

LACTEIN is put up in wood barrels holding: five, ten, twenty-five and fifty-two gallons. Should your local feed dealer not have Lactein, write us direct and we will see that you are supplied without delay, or better still send us $3.50 and we will ship you a five gallon trial order by express prepaid. This, when diluted with water as per directions, makes 150 gallons of feeding solution, and is sufficient to acquaint you with the wonderful merits of Lactein. The price in fifty-two gallon barrels is 50 cents per gallon, or about 1½ cents a gallon when water necessary for feeding is added. Write for our booklet "MAKING EVERY CHICK A CHICKEN."

Lactein Company,
Modesto, California.



CALIFORNIA CHAMPION HAMPSHIRES

As good as the best and better than the rest. A boar or a sow pig sired by my great herd boar Director, and out of one of my choice sows will add prestige to your herd. I am booking orders now for the pigs of March and April farrow. Write now and place your order.

L. A. DENKER
Boquet Canyon Saugus, Cal.

Poland Chinas, Medium Type

Choice breeding stock, both sexes from Panama-Pacific International Exposition prize winning strain; 12 firsts, Junior Champion and Reserve Grand Champion Boar. Junior and Senior and Grand Champion Sows, $2145 cash awards. Write to

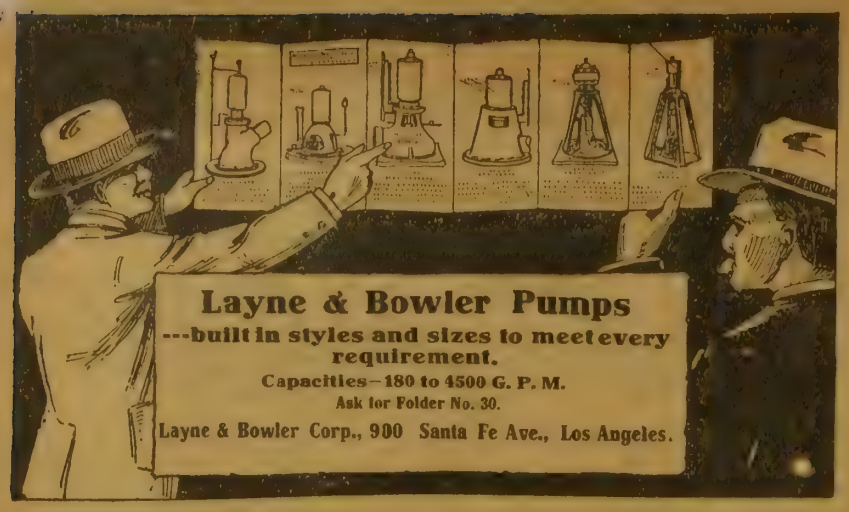
M. Bassett
Hanford, Kings County, Cal.

Uneeda Glenn County Herd
The Key Herd of Duroc-Jerseys

This herd produced more champions at the 1918 California and Oregon state fairs than any herd on the coast.

For sale now: Boars; gilts, bred or open; bred sows and a few weanling pigs of either sex.

Glenn County for Durocs
H. P. Slocum and Son
Willows, California



Prince Hiske Walker

He is by Prince Gelsche Walker and out of Hiske of Riverside, being therefore full brother to Lady Hiske Walker, 34.25 pounds butter in seven days as a junior four year old, former state record in class.

His offspring are uniformly straight, vigorous, and well marked. A few of his young sons for sale.

Packwood Farm

Notes on the Guaranty Sale

A smoker was tendered the visitors by the California Holstein-Friesian Association the evening before the sale. President Kiesel presided and called on about every one present for a few remarks.

Frederick Stimpson, proprietor of the Hollywood Farms, Hollywood, Washington, urged that the Holstein breeders of the Western States make every effort to have a Western member of the board of directors.

President Kiesel was appointed as delegate to the annual meeting to be held at Philadelphia this summer and O. W. Morris was appointed as alternate.

Resolutions were passed indorsing the pure feed bill now before the legislature in amended form.

A vote of thanks was also given Chas. Paine, Secretary of the State Board of Agriculture, for the many courtesies extended to assist the success of the sale.

During the smoker, Frank L. Morris announced that they were considering sending Tilly Alcartra, the world's greatest cow, to the court of Carnation King Sylvia, the $106,000 bull owned by the Carnation Stock Farms. What would a bull resulting from such a mating be worth?

Albert E. Smith of Sumas, Washington, who brought down a highly attractive lot of cattle, was enthusiastic over the appurtenances he found in this state for dairying. Three cows, a mother, daughter and granddaughter, from his herd, sold for $6100.

O. M. Plummer, general manager of the Portland International Live Stock Show, was on hand during the sale. Plummer states that his directors will offer a $65,000 prize list this year. The State of Washington has recently appropriated $10,000 to be distributed among Washington exhibitors at the Portland show and Plummer is endeavoring to induce the legislature of this state to do as much. The money will only be given California exhibitors.

E. C. Schroeder, whose herd of Holsteins at Moorhead, Minn., is counted one of the strong collections of the breed, attended the sale and announced that he was seriously considering moving his herd to this state. Such a herd would mean much to the Holstein interests of California.

The Carnation Stock Farms, Seattle, Washington, was represented by R. D. Kinger, who is the Pacific Coast manager of the Carnation Company. Kinger comes from a prominent family in live stock affairs. R. J. Kinger, a cousin, is secretary of the American Hereford Breeders' Association and J. C. Kinger, now in France, was manager of the celebrated Hereford Farms of Col. E. H. Taylor in Kentucky.

The honor of topping the sale goes to the Bridgford Company at Knightsen. It was from their herd that the $5000 yearling bull, the highest record bull on the Pacific Coast, came. Six head from this herd averaged $1884.

J. E. Peck of Calexico was one of the most persistent bidders on the choicer lots and succeeded in buying a particularly strong lot of females for his ranch in the Imperial Valley. Peck believes that the valley is destined to be one of the greatest dairy sections of the West and states that there is a real demand for good cattle.

E. M. Barry, Jr., Daggett, received many compliments on the discriminating manner in which he is assembling his herd. He is building on the blood of Prince Gelsche Walker and when stuff of that breeding came in the ring he kept nodding to the auctioneer until he had the last bid.

It is doubtful if Col. Ben A. Rhoades ever made a stronger sale. Starting with the first lot at 11 o'clock and with scarce an hour for lunch, he remained in the box until the last animal was sold at 8:40 p. m. and he was business all the time.

R. F. Bradley of San Bernardino secured many of the attractive females in the offering. Bradley expects to develop one of the good herds in Southern California.

Another good buyer from South of the Tehachapi was Geo. A. Brown of the Burr Company, Los Angeles. Brown selected four heifers of splendid breeding and nice individuality.

W. F. Mitchell of Visalia can count himself rather lucky to have the highest record bull on the Pacific Coast at the head of his herd at a cost of only $5000.

While the bull was selling breeders pledged 12 cows to be bred at $100 each—nearly 25 per cent on the investment to start with.

Gottshall & Magruder, Ripon, bought three daughters of the McAlister bull, It, for an average of $950. For one, It Idyl Segis, a daughter of the 35.66-pound cow, K. P. Idyl Segis, they paid $1450.

H. J. Long of Mason, Nevada, usually bid on the better sorts and succeeded in landing two—one a 28-pound from the Smith consignment, and one a fourth prize heifer at the National Dairy Show from the Carnation herd.

E. M. Marrow of Modesto confined his buying to tested cows and picked five with records from 18.1 pounds to 26 pounds. Included in his purchase was Belle Faskie Hengerveld De Kol 2d, grand champion at the 1918 California State Fair. She is bred to King Segis Alcartra Prilly, twice grand champion at Sacramento.

Toyon Farms Association, Los Altos, bought five head for an average of $1870. All were from Washington herds—four from Smith and one from Carnation. The Carnation cow, Ruby Pieterje of Forest Hill 2d, sold bred to the $106,000 bull and at the time of selling the consigners made an offer of $1200 for her calf in case it was a heifer. It was this firm that purchased the family of three from Smith for $6100.

Every cow or heifer that sold bred to Carnation King Sylvia, the $106,000 bull, was purchased by California breeders. J. E. Peck, Calexico; Toyon Farms, Association, Los Altos; J. M. Campbell, Escalon; J. D. Patterson, Patterson, and F. J. Gist of Tulare, each secured one.

One of the most critical buyers at the sale was W. J. Higdon of Tulare, whose success with Holsteins the past few years has been so conspicuous. The 30.32-pound Sir Skylark Ormsby Hengerveld Pet 2d, was taken at $1700 and two heifers, one bred to Judge Segis at $750, and one a daughter of Hollywood Homestead Veeman.

Col. H. C. Cranke of Nez Perce, Idaho, made his initial appearance in a California sale ring and his work was of a highly satisfactory character. Cranke was another visitor who said he was seriously considering coming to California to locate. This was his first visit to the state and he said he had never seen a section that offered such live stock possibilities.

SAVE CALIFORNIA'S DAIRY INDUSTRY

Pure feeds are essential, or if they are to be adulterated or "filled" with roughage, let that fact be stated so that the dairyman may buy with eyes open. Let every believer in the state's welfare write his assemblyman and senator and appeal for the passage of Assembly Bill 480 by Cummings or of the Higdon Senate Bill 93 with Cummings amendments. If this can be secured the live stock and poultry interests will be protected, and no honest miller wronged. Corn cobs and grain hulls may be fine for roughage but not wanted in concentrates.

STRENGTH!

Like this mammoth crane, Samson Tires are built to carry the load.

Every ounce of material that goes into their construction is tested for strength and endurance. That's why Samson Tires stand up under the severest strains of rough going.

The name "Samson" stands high in the estimation of the man who knows tire values.

Samson Tire & Rubber Corp.
Compton, California

Live Stock News Notes

Nevada Bull, Hereford Attraction

C. L. Hughes, manager for the sale of Herefords to be held under the auspices of the Pacific Coast Hereford Breeders' Association at Davis, April 9, states that he has just been informed by J. H. Cazier & Sons, Wells, Nev., that in order to increase the attractiveness of the offering, they have decided to substitute two bulls for two females originally catalogued. Both are attractive bulls, but one is especially outstanding. This bull, just turned two years old, is Brave Lad by Beau Monarch, a grandson of Beau President. The dam of Beau Monarch is a granddaughter of Beau Brummel. His own dam is also a granddaughter of Beau Brummel, thus making him a rather intensely bred Anxiety.

The Caziers speak very highly of this bull and assert that he will be an added attraction to their own consignment and the sale in general.

Dibblee Barn Burns

Quite recently the large horse barn on the San Julian Rancho, near Santa Barbara, owned by the Dibblee Estate, was destroyed by fire. At the time about 26 horses were in the barn but fortunately all but one were saved.

McCarty Strengthens His Poland Herd

Alex D. McCarty of San Francisco, who maintains a select herd of Poland Chinas at his Riverside Farms near Modesto, has recently received a bred gilt from Robinson Bros. of Norton, Illinois. She was sired by Fashion Masterpiece and is out of a Big Bob dam and bred to Expansion King, junior champion at Illinois and the National. McCarty is making plans for his debut as a Poland breeder at the forthcoming state fair.

Buys Jersey Bull

A. J. Morly, Jersey breeder of Orland, has purchased a young bull from H. West, Scappoose, Oregon.

The youngster is by Fussy Ferns Noble, a son of the $25,000 bull Golden Ferns Noble and out of an imported cow.

Establishing Duroc Herd

F. D. Burr of San Francisco, who has a large alfalfa farm near Orland, is establishing a herd of Duroc-Jerseys. Some 40 sows and several boars now comprise the herd. From these sows and litters will be developed the permanent herd with the addition of some new blood from the East.

The Burr purchases were chiefly from the Lamb and Slocum herds.

Receives Polands From East

R. J. Yates, Poland-China breeder of Orland, has recently received from the East a sow by Miller's Chief, bred to Miller's A. Wonder, and a gilt by Big Bone Leader bred to Big Bob's Leader.

Mr. Yates states he is entirely sold out with the exception of a few young pigs. Recent sales include 11 gilts, four sows and a boar to E. F. Hale, Orland; two gilts to R. P. Frisby, Napa; sow and gilt to Mrs. H. M. Goodfellow, Williams; boar and sow to J. H. Hartman, Del Paso Heights; boar to James McCampbell and a sow to John Merzwick, Geyserville.

Mr. Yates says that he has never known such a keen demand for pure bred hogs as exists at the present time.

Expect Big Year for Berkshires

Quite a number of improvements are under way in the swine department of the Mills Orchard Corporation, Hamilton City.

A large alfalfa field is being cut up into small lots for their Berkshire sows and litters and for their breeding animals.

The feed lots used for fattening hogs are being graded with a slope from the center to the sides along which are concrete drains. These lots will be graveled and oiled, thereby eliminating the mud during the rainy season. Concrete hog wallows and drinking troughs are also being installed. Over 75 sows have farrowed during the past six weeks, with 130 more expected during the next month.

Since the first of the year four cars of fat hogs have been sent to market with two more just fininshing off.

Mr. Mills states that the total sales from the swine department this year will run close to $50,000.

Recent sales of pure bred Berkshires are: Bred gilt to A. A. Harris, Strathmore; bred gilt to Roy Gooch, Cedarville; bred gilt to Mrs. Clede W. Bliss, Pazo; sow to H. S. Norman, Visalia; boars to Mendocino State Hospital, Ukiah; Preston Reform School, Ione; Walter Pfeffner, Chico, and Thomas Dairy, Calistoga.

Will Show Durocs

W. T. Hollingshead & Sons of Orland are among the newer firms entering the fold of Duroc-Jersey breeders. They are developing two young boars, one by King's Model, the other by Bates' Orion King. Both will be shown this fall along with their futurity candidates.

This firm made their first show last year at the California State Fair with stock secured from the Slocum herd.

Farmers and dairymen of New York are said to be disappointed that the daylight saving law was not repealed.

Rule's Herefords

Sonoma No. 625000, 2465 pound bull at four years old—after two years hard service.

He is by Beau Perfection 9th No. 368012. A full brother to the great Woodford $50,000. Over 200 in herd. Foundation stock Gudgell & Simpson Anxiety bred cows. See my consignment at Hereford Sale, April 9th at Davis. Nine of them are by Sonoma, including four show yearlings.

Four Hundred Hens in Limited Space

By Jean A. Koethen

IT IS a difficult matter by any other system, and fraught with many chances of failure, but by the Philo system one can keep a good many hens in very limited space if only he is not afraid of work. L. Stratton of Glendale has proved this, and while he admits that the labor required increases as space decreases, he also insists that production is increased by close confinement.

The Philo system is based on the principle that a few hens in a small coop will lay more eggs and require less room than a large number of hens in one flock in a large house. Mr. Stratton has modified the Philo system to suit his own ideas of what California climate demands and has evolved a smaller and more simply constructed coop. The coops in which his 400 hens are housed are modeled after the Philo chick coop, but are higher, and those which are most satisfactory are also larger on the ground. The Philo chick coop is three by six, and one foot high. Mr. Stratton's coops are 30 inches high. His earlier models are of the same size on the ground as the Philo coop, but those of later design are four by eight instead of three by six. This allows each of the 12 hens in the coop two and a half instead of one and a half square feet.

As is shown by the picture, a characteristic feature of Mr. Stratton's coop is the open strip along the front, covered with wire, which permits the sun to enter the coop as long as it shines. In addition to the hinged roof or lid, which may be held at any angle by the notched stick which supports it, the coop is covered partly with wire and partly with a frame covered with canvas. This makes it possible to adjust the ventilation of the coop to suit any kind of weather.

Absolute cleanliness is essential in keeping fowls by this method. Mr. Stratton cleans the droppings from the bottom of the coop, which is the ground itself, every day, and moves the coops to new ground every few months. The more perfectly clean the coops are kept, the longer can they be kept in one place. The 30-odd coops which house Mr. Stratton's 400 Buff Leghorns and Rhode Island Reds are placed in rows fronting south and cover an area of not more than 2500 square feet.

Mr. Stratton's chick coop is far simpler than the Philo model. It consists of a frame three by four and two feet high, covered with tarred paper. Across a portion of the top are wooden slats on which the piece of tarred paper which serves for a roof is laid. A small section of the top is covered with wire over which may be laid, when it is needed, a long pane of glass. When the chicks are first out of the incubator the top is entirely covered with paper and glass. As they grow older the glass is removed and part or all the top left open according as the weather is warm or chilly. When the chicks are five weeks old they are moved to the smaller laying coops.

Last year Mr. Stratton caponized a hundred of his Rhode Island Red cockerels. In February of this year they weighed from nine to ten pounds apiece.

Multum In Parvo

Philo coops lend themselves to cramped positions or where it has been impossible to give space to larger houses and runways.

AMERICAN EGG LAYING CONTEST

By Russell F. Palmer, American Poultry School, Leavenworth, Kansas

In spite of the sudden changeable weather conditions here in February we secured a very high average egg yield from all the standard bred pullets in the American Egg Laying Contest. Understand, please, these pullets are not only standard bred, but every one was scored by a general licensed American Poultry Association judge and any bird that did not score up to a point to make it worthy of rec-

THE POULTRYMAN'S CALENDAR—APRIL, THE GROWING MONTH

Keep the chicks growing steadily these cool days. If there are late hatches they ought to get a splendid start, possibly even overtaking the March chicks if they are well cared for.

The secret of keeping chicks growing is never to let them stop for a minute. There must be no colds, no indigestion, no slack crops at night, no lice, no mites, no lack of greens or protein.

Remember, a chick a month old needs stronger food than one a week old. As the chick grows older, mash and scratch grain should be modified to suit its age. At Cornell, chicks are given this dry mash from the fifth day on: Three pounds each of bran, corn meal, middlings and beef scrap. After four weeks the grain ration is changed to three pounds whole wheat, two pounds cracked corn, one pound hulled oats. The mash is moistened with sour skim milk at first, but gradually more and more of it is given dry. At Storrs, after the first week the mash consists of two parts by weight of bran, and one each of corn meal, flour middlings, ground oats and beef scrap.

Set hens on turkey eggs any time this month.

ognition in any show room was disqualified from this contest.

Judging by the February work of the pullets in this contest it is going to be very difficult to even guess what single pullets or whose pen is likely to be the winner at the end of the year. It is just as hard at this time to even guess what variety or breed will contain the winners.

One thing that this and other contests have clearly proven—something worthy of thought and a matter the interested poultry public deserves and desires more information on and that is this: No one breed or no one variety can claim the best layers. Instead we find that more depends upon the family or strain of a variety than upon any particular variety. For instance a general idea prevails that White Leghorns are wonderful layers—they are. Still we find some families or strains of White Leghorns are decidedly poor layers while other strains are good layers. This has been found true with almost all varieties. In so far as the birds themselves are concerned high egg production depends altogether upon breeding and selection first; upon housing, feeding, systematic care and cleanliness second.

Including the substitutes there are 382 females in the contest. However, we find that all 384 of these fine standard bred pullets averaged an even 20 eggs each for the 28 days of February.

The five high pullets at the end of the fourth month were as follows: Silver Wyandotte, Buff Orpington, White Orpington, White Wyandotte and Buff Minorcas. These five are closely followed by a Buff and a White Leghorn. A pen of five S. C. White Leghorn pullets are easily leading on March 1, though second place for the pen record is in a tie between a pen of Barred Plymouth Rocks and a pen of White Wyandottes closely followed by a pen of White Orpingtons.

The averages and high totals made by the different varieties for the month of February were as follows:

Variety—	Feb. Best Pen Leader. Eggs	for Feb. Eggs
Brown Leghorn	23	99
White Leghorn	28	129
Buff Leghorn	26	99
Anconas	25	92
Buff Minorcas	25	101
W. Plymouth Rocks	26	97
Buff Rocks	28	122
Barred Rocks	28	94
S. C. Reds	28	136
R. C. Reds	26	89
White Wyandottes	27	116
Silver Wyandottes	23	99
White Orpingtons	26	116
Buff Orpingtons	28	110

PEEPS AND CLUCKS

Be sure the sitting hen is in a dry place these wet days, but let her get off every day to eat and run a little. See that corn is always within her reach.

Do you scald your chick fountains occasionally? Not every day but now and then, to make sure they are reasonably clean? A chick would rather drink from a puddle than anything else, but that is no reason for giving him a filthy fountain.

Don't skimp the feed of baby chicks. A chick, like a baby, is more easily underfed than overfed.

When you want to add variety to your chick ration, try a dish of plain bread and milk. Chopped cooked meat is a splendid appetizer also.

When the chicks in the brooder lie around comfortable near the edge of the hover the temperature is right. If they go far outside the hover, see if your heat is not too high.

Don't forget to put a little charcoal in the chick mash. Not all chicks feed it, but they all like it, and it may prevent digestive troubles.

A good ration for chicks the first four weeks is a mash consisting of wheat bran, four parts; alfalfa meal, two parts; corn meal, three parts; middlings, three parts; sifted beef scrap, four parts; ground bone, one part. The beef scrap is hopper fed; the other ingredients are moistened with skim or sour milk and fed three times a day. With this mash is fed a grain ration of three parts cracked wheat, two parts finely cracked corn, one part pinhead oat meal.

Don't expect the chicks to be free from lice if the hen is lousy. Devil's dust or some other good louse powder rubbed into her feathers every two or three weeks will keep them all clean.

Mites will always find their way into a brooder or brood coop sooner or later if means are not taken to keep them out. Go over the inside of your coop every week after the warm days come with crude carbolic acid and kerosene (one part acid to from five to ten of kerosene). Disinfect the brooders before each new hatch is put in and oftener if you suspect the presence of mites.

Chicks that are on a sandy or adobe soil must have chick grit constantly before them. Those on granite soil usually do very well without grit.

If you see a droopy chick, get out the louse powder.

POULTRY AND THE WOMEN FOLK

From earliest times the care of the poultry on the farm has devolved on its women. The egg money has belonged to the farmer's wife and she has been recognized head of the poultry department. Now that interest in poultry has extended into the city, it is the women everywhere who are most enthusiastic. No woman who has room for them can afford to ignore this most useful fad. Looking back at my own early married days, when no woman who considered herself anybody kept chickens or talked about them, and comparing them with these days when the most charming and cultured women I know, wives of college professors and ministers, often call me up for advice about their chickens and hens, I am amazed at the increasing respectability and distinction of the poultry industry. The farm woman who thinks city women have advantages she cannot share should congratulate herself that there is one fad, and that the most useful and healthful of all, which she may share with the women of the whole world. The farm girl, coming to maturity without her fling at the amusements of the city, may congratulate herself on having the opportunity for which thousands of city folks are longing. The farm boy, privileged to learn the care of stock and poultry and rotation of crops before he goes to college, has a chance which many city boys envy him. Are we coming back to the land? It looks so, and there is no better place for any boy or girl to begin than in the care of hens and chicks.

Prevent White Diarrhea From Killing Off Your Baby Chicks

Mayer's Six Weeks Baby Chick Developer is guaranteed to prevent White Diarrhea and raise 95 per cent of all your chicks or your money back—but it does still more than this—it is a tonic—a food—a builder of tissue, blood and bone. It is a scientifically prepared chick food that accomplishes the same wonderful results as the scientific foods that are used for babies the world over.

Raise All Your Chicks

White Diarrhea, the national poultry plague, kills millions of baby chicks every year. The poultry raiser's loss from this dreadful disease is tremendous. It's a crime against the poultry raiser's efforts and his labors. Stop losing from 30 to 55 per cent of your spring hatch. Prevent White Diarrhea by using Mayer's Six Weeks Baby Chick Developer.

This Big $2 Sack Will Last Six Weeks

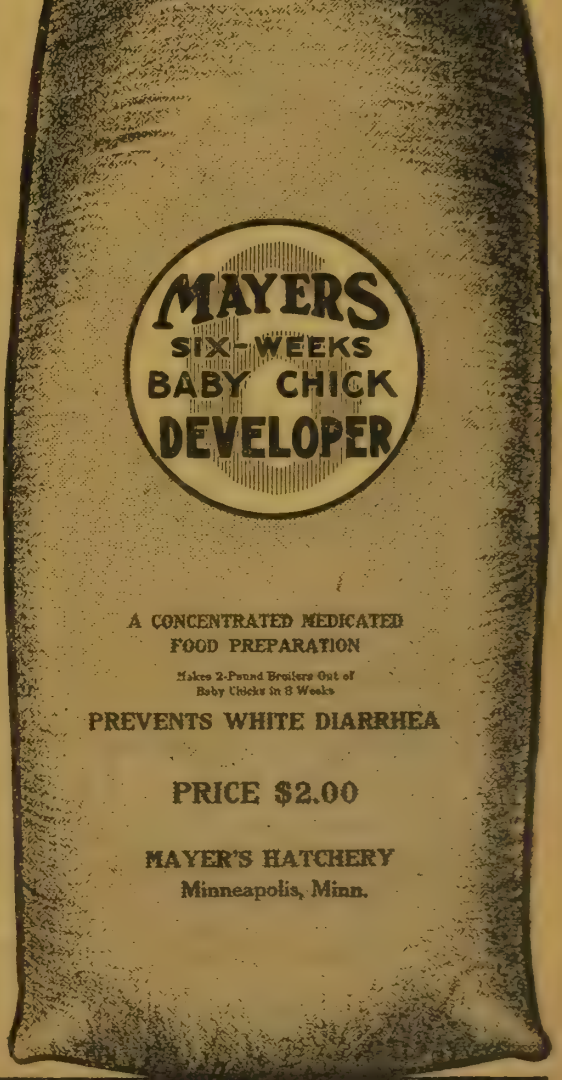
Mayer's Six Weeks is put up in sealed sacks only. One sack will last an ordinary flock of 140 chicks for six weeks. Don't confuse our sacks with the ordinary four to six-ounce package, because it is entirely different. It contains no filler and is made up entirely of concentrated medicine and food.

Special Half Price Offer

A Regular $2 Sack, Prepaid, Only .. $1.00

Dealers' and Agents' Price: 12 $2 Sacks, $8.50

I am making you a special half-price offer on my regular $2.00 sack of Mayer's Six Weeks Baby Chick Developer for only $1.00 and I am paying the carrying charges myself. Order now direct from this ad and save exactly one-half. Prevent White Diarrhea—develop two-pound broilers in eight to ten weeks and start your pullets laying early. One big sack of this wonderful chick tonic and developer for only $1.00. Send the coupon now.



Is a Chick's Life Worth One Cent?

Think this over—what are you doing for your chicks? Are you giving them a chance to earn a big profit for you? For less than one cent you can make sure of raising 95 per cent of your hatch or your money back. The big sack that I am offering you here will last 140 chicks six weeks. Our grandfathers used to say "An ounce of prevention is worth a pound of cure." This old saying is as true today as it ever was. Raise all your chicks. Use Mayer's Six Weeks Baby Chick Developer.

Money Back Guarantee Every sack of Mayer's Six Weeks Baby Chick Developer is sold under an absolute guarantee. If you are not perfectly satisfied, you get your money back.

Order Today Thousands of successful poultry raisers are now using Mayer's Six Weeks. Every raiser should be using it. You should have a sack on hand all the time. Here is a chance to save one-half. Mail your order now. Just enclose $1.00 with the coupon.

CATTLE

HOLSTEINS AT AUCTION
On Saturday, May 3rd, Napa State Hospital, Napa, California, will sell from its noted herd of grade Holsteins 20 fresh and springing cows; 50 bred heifers, about 20 of them springers; 30 unbred heifers. The 117 milking females in the herd, including many 2 year-olds with first calf, average 11,503.6 pounds milk last year. Some of these cows, and daughters of the best cows in the herd, bred to the great Napa State Hospital herd bulls, including a son of the world's record cow, Raphaella Johanna Aaggie 3d, will be sold. Registered sires used in the herd for the past 14 years; herd tuberculin tested for ten years. Eight choice registered Holstein bulls will also be sold, out of dams with official records up to over 29 pounds butter in seven days. Everything over six months of age tuberculin tested. Sales manager, C. L. Hughes, Sacramento; auctioneer, Col. Ben A. Rhoades, Los Angeles.

We have one or two Guernsey bull calves left old enough for service and several youngsters. All out of A. R. cows with big records and sired by the best blood in the country. You need a Guernsey bull to put color, flavor and butter fat in your milk. Herd free of tuberculosis by state test. Write for full information. Elliott-Brant Rancho, Owensmouth, California.

THE MAN WHO STICKS

The man who sticks has this lesson learned:
Success doesn't come by chance — it's earned
By pounding away; for good hard knocks
Will make stepping stones of the stumbling blocks;
He knows in his heart that he cannot fail,
That no ill-fortune can make him quail
While his will is strong and his courage high,
For he's always good for another try.
He doesn't expect by a single stride
To jump to the front; he is satisfied
To do every day his level best,
And let the future take care of the rest.
For the man who sticks has the sense to see
He can make himself what he wants to be,
If he'll off with his coat and pitch right in—
Why, the man who sticks can't help but win.

—Oakland Enquirer.

STEREOSCOPE PLAYED A BIG PART IN WAR

By Douglas Reid in Popular Mechanics

BESIDE the plush album on the center table in the parlor of half the homes in America rests one of the deadliest weapons of this war. And yet, in all of American preparedness plans, in all the arming of a nation, not one voice lifted itself to suggest that a million citizen soldiers spring up overnight with stereoscopes in their hands.

The old fashioned stereoscope through which Uncle Elmer, Aunt Hetty, and little Chester—Sunday visitors—used to gaze so breathlessly upon marvelous views of the Mammoth Cave, Lincoln's Funeral, and Sardine Fishers off Brittany; this quaint semiridiculous old instrument of Sabbath entertainment carried roaring, smashing hell to the Huns of Wilhelm, the "scourge of the world".

It was the stereoscope that proved to be the greatest single aid to the detectives of the aerial photography corps of the Allies in their discovery of the expertly hidden batteries of the Germans. It was the stereoscope that penetrated the best battery camouflage that German artillerymen ever devised. Further than that, it removed the one great obstacle to the correct reading of aerial prints—lack of the proper perspective. The camera in the air shoots directly downward; in its pictures the height of objects is lost, and an entirely new viewpoint on the world given the observer. The familiar objects of life become mysterious to him when he cannot see their dimensions in the common fashion.

The camera looks with one eye. A man looks with two eyes, and these two eyes, being a few inches apart, inform the brain that the object looked at has length, breadth and depth. A one-eyed man looking at the front of a house would say it was a wall, but if he had another eye it would see a little of the side of the house and signal the information to the brain that the object had three dimensions.

Now the aerial photographers applied this truth as follows: They knew that two photographs taken of the same object with an ordinary stereoscopic camera, in which the lenses are 2¾ inches apart, would not produce the sterescopic effect, since the object photographed would be miles below, too far for the camera to catch its dimensions and make them apparent in a picture.

However, the photographers bethought themselves that if they put 100 yards between the two pictures—snapped a trench from one elevation, moved 100 yards ahead on a level, then shot again—it would be as though a giant with 100 yards between his eyes were looking at the object.

So they tried this, mounting the resultant photographs on cardboard and looking at them through an old-fashioned steroscope. The result was better than their anticipations; the depth and height of objects were tremendously exaggerated. A cottage looked like a tower, a bucket like a well, a trench like a canyon, a hill like a mountain. But they soon learned to translate these eccentricities into common sense—the great thing had been done, the landscape was made to assume reality in picturees.

Roadside ditches in which men might lie in insufficient shelter could now be told from high walls behind which there was ample shelter—an extremely important thing to know when men are to charge into such territory. Steep slopes up which the men were to charge, and which had been in ordinary photographs flat as water, now showed themselves in their true nature—death traps—and the discovery of the fact saved the lives of the attackers.

SOME TEXAS RECIPES

We read the Cultivator every week with much pleasure and profit and I am going to send you some Texas recipes for the household department.

Whole Wheat Biscuit

One pint sour milk, one teaspoon soda, one teaspoon baking powder, one teaspoon salt, one tablespoon sugar, two tablespoons shortening, enough whole wheat flour to make a firm dough. Roll them, cut out and bake in a hot oven. We buy wheat (when we can) and have our flour ground in a grist mill and have a better quality than commercial graham or whole wheat flour. We like it ground coarse like corn meal and use no other kind of flour except "when company comes."

Hoover Stew

One cup Lima beans, season with bacon or butter, cook two hours, then add one and a half cups raw diced potatoes and one cup raw chopped onions. Salt to taste and cook slowly one and a half hours. When nearly done add one cup sweet milk and thicken the soup with a little flour and water. Serve hot.

Custard Pie

One tablespoon butter, one-half cup sugar, two eggs beaten separately, adding the yellows first, then the whites, one cup of sweet milk and flavoring to taste. Heat nearly to the boiling point and pour into pan lined with uncooked pastry. Use only one crust and bake until firm and brown. This recipe can be used in various combinations. Adding a cup of cocoanut or pineapple makes a delicious pie. Or fill the crust half full of stewed dried apples, currants or seedless raisins and finish filling with the custard. This amount of custard will make two fruit custards.—Mrs. C. S. C., Labinal, Texas.

"A USE EVERYTHING IDEA"—THE HANDY STOCKING

I have read with interest a number of articles in the California Cultivator on making use of everything.

Here is another idea which may help us to let nothing go to waste in these days when so many are in dire need.

What shall we do with our stockings? When they are new, begin to watch them carefully and darn each small hole. They will wear twice as long. Take the money thus saved and send it to our unfortunate neighbors across the ocean for some good warm stockings. When ours are no longer fit to darn we may foot them.

Now if we have started out with good stockings the legs or parts of them may still be used in many ways.

Cut the top of the stocking off eight or nine inches in length, or the desired length according to the age of the child, gather or pleat at the cut end, sew on a pretty tassel and you have a good stocking cap for a child's play cap. If the stocking is a silk one, this makes a good auto cap for the child.

Did you ever try stocking tops for half sleeves? They are excellent. Put a little band around the wrist part and rubber at the top.

The next time you burn your finger on a hot kettle, sit down and fold together six or more thicknesses of an old stocking top—perhaps four and one-half by six and one-half inches or any size to suit—stitch around the edge without turning under for hem and several times back and forth across the holder, sew a tape hanger on and you have a kettle lifter in a few minutes. Hang several of these on a nail by the stove and you will be surprised to find how handy they are.

A good firm piece of a stocking top may be used to mend black petticoats and other ready-made garments of which you have no scraps.

Sew across the bottom of the cut end of another stocking top, tack a piece of tape or shoestring (long enough to tie around the top) at bottom of the hem of the upper part, and you have a convenient bag for twine, scraps and many things.

My favorite dust cloths are made of several stocking tops quilted together. I sprinkle these with 3-in-1 oil, and they may be used on the finest pieces of furniture. Put these dust cloths in a covered tin can or box for a few days after sprinkling with oil and they are ready for use. These may be clamped into a mop and used as you would a dollar dustless mop.

Other uses for the stocking will be sure to suggest themselves to you if you give it a little thought.—Subscriber.

SOME ECONOMY HINTS

By Mrs. A. W. Black

Cooking Economy

Noticing good economy hints from another I suggest these. Left over oatmeal mixed with eggs and fried resembles fried brains. Beat the eggs well and add a little milk. Left over cornmeal improves muffins greatly, just balance by extra baking powder. Left over meat, either raw or cooked, even fried, is appetizing if cut in small pieces, seasoned and cooked with curry powder and onions, the latter added shortly before serving so as to be slightly crisp. This should contain plenty of gravy which is best thickened a little. About a teaspoon curry is right for average size family. This curry preparation is to be served with rice freshly boiled with a little salt and most people relish it. Try it. A little left over rice, corn meal or gravy go in the soup pot. Bake your left over rice with milk, raisins and sugar. Milk baked into rice adds greatly to its nourishment, though water can be used. Don't use alum baking powder.

More Sack Uses

Many good suggestions have been given here for sacks of all kinds. I also have found them useful. Am now bleaching strong smooth flour sacks to make everyday rompers for the baby. Two-piece rompers buttoning at the bottom are simplest. My main suggestion is the use of rice or sugar sacks, which are very firm burlap, sewed together to form porch curtains for a sleeping porch. These will admit a subdued light preferable to canvas, except in cases in which one wishes to exclude light entirely. Cement sacks do very well in that case.

Chest Protector

Take outgrown white wool stockings and, if baby's, sew two together after cutting them from the top to the toe, cutting the heel in the middle. Then cut slightly to shape for the neck. Don't cut off the feet as you'll need these to obtain good length.

Simple Dyes

Blueing or diluted inks serve very well to dye cheesecloth for comforts, flimsy waist material and faded dainty things.

Honey Spice Cake (Original Recipe)

One cup white flour, one-half cup graham flour, three teaspoons baking powder, one-half teaspoon salt, one scant cup sugar, one-half teaspoon nutmeg, one-eighth teaspoon ginger, two teaspoons cinnamon. Sift these together and then add: Two tablespoons honey, two tablespoons shortening, one cup milk, two egg yolks, beaten, one-half cup nut meats.

Bake in two small layer pans in moderate oven and frost with white frosting, using two egg whites stiffly beaten into syrup made of one cup sugar cooked with one-half cup water till it forms soft ball in cold water. Add one teaspoon vanilla, one teaspoon baking powder, beat well and apply to cake.

PAINT THE SCREENS

The life of the screens over windows and doors may be more than doubled if they are painted at least once a year. A screen paint should be used or else a light or thin mixture. Too thick a paint fills the holes and gums up so that it practically destroys the screen.

A SCRAP OF RIBBON

August, 1914. The late days of August. The "Little Contemptibles" in retreat. With the "Little Contemptibles" bles" and under their protection, the inhabitants of Belgian villages, sleeping, eating, marching, bivouacking side by side with their protectors.

For days, from the moment when he had appeared as her shield and champion, Marie-Claire had never left the big, silent Englishman. They ate and drank from the same mess-kit. At night his blanket covered her, while he went without. During the day they marched. In all the gloom and strain of that retreat he remained unchanged. She saw him mounting guard, going without food, without sleep, at the business of war, going in and coming out of action. He was always the same.

To Marie-Claire, too, he was always the same—gentle, respectful, chivalrous. In days like those, miracles were always happening. In the heart of Marie-Claire, one happened—the miracle of love.

One day, after the battle, a general took from his coat the scarlet ribbon of the Legion of Honor and pinned it on the tunic of a British private. Marie-Claire heard the big man beside her catch his breath.

"I'd give my life-blood for such a bit of ribbon," he said. Marie-Claire looked at him. There was light like a glare on his face and a bayonet-flash in his eyes. In that moment, Marie-Claire, was glad, for she had read his heart's desire.

At the Marne she lost him. Then, a comrade straggled into the village where she had taken refuge, and told her the last of him. No line, no cross, above him. No scarlet symbol for him. His only the glory that was the Marne.

Two years later. After Verdun. A Belgian nurse stands before a general at the prise d'armes and receives along with the salute, a red ribbon for her wearing. She hears of her devotion and daring in the dark days at Verdun, from the general's lips. For the words that he reads she substitutes others.

An English breakfast table. A foreign letter. The white-haired mother opens the letter and first curiously takes out of the tissue-paper a bit of scarlet ribbon with a cross attached. Wondering, she reads:

"I want you to know, this is not mine, but his. This ribbon is his life-blood. My life is only his monument."
—Red Cross Bulletin.

HANG UP BROOM AND CLEANING IMPLEMENTS

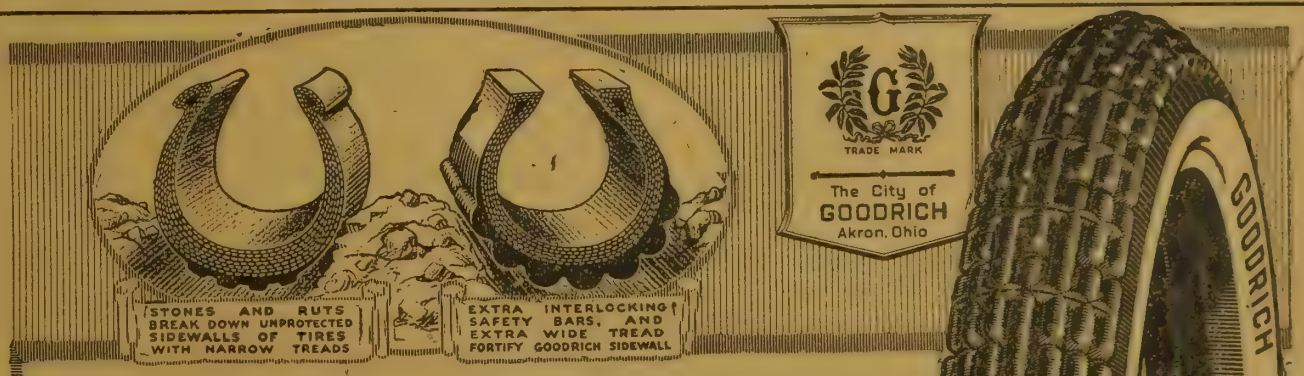
Brooms which are suspended from nails, instead of standing in some corner, never become one-sided. The uneven wear of brooms is not due—as so many persons think—to the fact that the broom is used more on one side; it is because when unused it is allowed to rest sidewise against a wall with the bristles all bent in one direction. Then no amount of changing or turning while using can correct the bending. I have a broom which has been in constant use for nearly two years and as it is always hung up when not in use it is as free from the common one-sidedness as when it was bought. Soft brooms are also kept in much better condition when not allowed to rest on the bristles. Put up a row of nails in the shed, or wherever you keep the sweeping things, and see how much more room you have if you hang up brooms, mops and carpet-sweeper. Use the shed walls, too, for hanging the clotheshorse, the ironing-board, the clothes basket and market baskets. Get everything out of the way but still within reach. By using the walls in this way many more things can be kept nearer the places where they are used, because of the smaller amount of space which they occupy.

AIRSHIPS

By Alice E. Allen in Youth's Companion

You want to buy an airship?
Which make do you prefer?
The Dandelion's out of style,
But Thistle makes a stir.

Some fairies choose the Milkweed—
It carries quite a load;
I knew one who Witch Hazel bought,
Then found it would explode!



You want to travel swiftly?
To see the loveliest things?
And go quite safely? Seems to me
I'd try the Swallow's Wings.

Save 1-2 on Fuel

CHEAPEST HEAT YOU CAN BUY

The Sievert Oil Burner burns distillate costing only 7½ cents per gallon in cook stoves, heaters, furnaces, pasteurizers, boilers, etc. Absolutely safe, odorless, very convenient and low priced. MAKES HEAT AT HALF WHAT WOOD AND COAL COSTS. Install it yourself. Write for circular and prices on different sizes, address Sievert Oil Burner Co., 710 North Main St., Los Angeles.

Rut Riding, and the Goodrich Sidewall

BETWEEN your farm and town is at least one stretch where you either drive in the groove of wagon trucks—or ride the bumps beside them. Without arguing which you do—or which is better for your tires—it is enough to say the ruts grow deeper day by day—and their sides of sand and gravel bits grind busily away at the sidewalls of your tires.

Turn now to Goodrich Tires, and see how the interlocking safety bars of Goodrich's thick, practical *safety tread* spread beyond the ball of the tire to the sides of it. And examine how the extra wide tread carries on up the sides beneath the side strips, and fortifies the inside of the tire with an extra shield of tough tread rubber.

That's the Goodrich answer to rut riding. It is one reason why Goodrich Tires meet the demands of farm service as if they were designed expressly for it.

For a Ford Car, Goodrich's "Three Seventy-five" Tire—a bigger Ford size—makes a super-Ford out of your car.

For a high power car, Goodrich Silvertown Cord Tires deliver a special high power service. Remember that whether you need pneumatic tires or truck tires, a farm on a Goodrich basis is saving money on its tires.

Buy Goodrich Tires from a Dealer

GOODRICH
TIRES
"BEST IN THE LONG RUN"

TALK about smokes, Prince Albert is geared to a joyhand-out standard that just lavishes smokehappiness on every man game enough to make a bee line for a tidy red tin and a jimmy pipe—old or new!

Get it straight that what you've hankered for in pipe or cigarette makin's smokes you'll find aplenty in P. A. It never yet fell short for any other man, and, it'll hand you such smokesatisfaction you'll think it's your birthday every time you fire up! *That's because P. A. has the quality!*

You can't any more make Prince Albert bite your tongue or parch your throat than you can make a horse drink when he's off the water! Bite and parch are cut out by our exclusive patented process!

You just lay back like a regular fellow and puff to beat the cards and wonder why in samhill you didn't nail a section in the P. A. smokepasture longer than you care to remember back!

Buy Prince Albert everywhere tobacco is sold. Toppy red bags, tidy red tins, handsome pound and half pound tin humidors—and —that clever, practical pound crystal glass humidor with sponge moistener top that keeps the tobacco in such perfect condition.

Belgian hares 18.

LIVE STOCK

By F. P. Allen, Bureau of Markets, Los Angeles

Live steers are daily becoming more of a drug on the market than for many months. Wholesalers have had to reduce their prices on dressed steers a dollar per hundred pounds in an effort to move accumulated supplies. Further declines are anticipated. Cows are fully steady owing largely to the light supply. Hogs are strong. Spring and fall lambs are steady. Ewes are firm.

The following prices for classes and grades of live stock represent those being paid by local killers f. o. b. Los Angeles County point prices are usually $1.00 to $1.50 less than these figures dependent upon the distance from this city.

Good steers .....13.00@13.50
Medium steers .....11.00@12.00
Common steers .....9.50@10.50
Good cows .....11.00@12.00
Medium cows .....9.00@10.50
Common cows .....6.00@7.50
Hogs No. 1, 175-225 lb. .....17.75@18.00
Hogs No. 2, 250-400 lb. .....16.50@17.00
Feeder hogs .....14.00@14.50

Above prices are for grain fed hogs in carload lots, f. o. b. Los Angeles.

Lambs No. 1, 55-70 lb. .....16.50@17.00
Lambs No. 2, 65-80 lb. .....15.00@15.50
Wethers No. 1, ...11.00@12.50
Ewes No. 1 .....9.00@10.50

Citrus Fruit Market

Los Angeles, April 2, 1919.

There has been slight shading of prices in some markets but exceptionally fine returns are still being made. There are still something over 3000 cars of navels to be shipped but these will be largely cleaned up during this month. Seedlings, sweets and St. Mikes will also clean up about the same time, after which Valencias will have the board through the summer.

The lemon market is no better. Indifferent or poor fruit is liable to command less than packing and freight charges. First class stock occasionally commands close up to $4.00. There are large quantities of foreigns being received.

Shipments

Shipments of citrus fruits to date since November 1, 1918: Southern California, oranges 13,000 cars, lemons 3163, total 16,163. To same date last season; oranges 6209, lemons 1644, total 7853. Central California this season; oranges 2993, lemons 354, total 3347. Last season to same date; oranges 1998, lemons 113, total 2111. Northern California; oranges 244, lemons 202 last year same date.

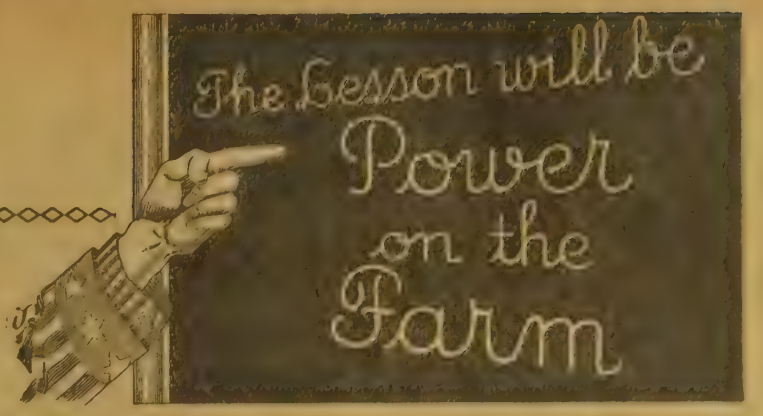
AT THE AUCTION

March 31

New York: 44 oranges, 4 lemons. Nav., 2.40-5.70. Seeds., 3.60-5.00. Sweets, 3.85 4.35. Mikes., 4.50-4.65. Lem., 2.30-3.80.

Cleveland: 10 oranges, 2 lemons. Nav., 3.40-5.50. Bloods, halves, 2.55-2.60; whole, 5.15. Lem., 2.65-3.25.

Philadelphia: 9 oranges, 2 lemons. Nav., 3.50-5.25. Bloods, 5.35. Lem., 2.40-3.90. Tang., halves, 2.35-3.00.



St. Louis: 7 oranges, 1 lemons. Nav., 3.95-5.20. Seeds., 5.00. Bloods, 5.00-5.05. Sweets, 5.00. Mikes, 5.00. Lem., 3.45

Boston: 22 oranges, 2 lemons. Nav., 3.60-5.30. Lem., 2.50-4.00. Bloods, 4.30-5.30.

Power Drives The Farm

The Second Annual Tractor Demonstration Will Be Held at Sacramento, May 6th--11, 1919. It Will Be a Six-Day Lesson on Power on the Farm.

It Will Be the Largest Exhibit Ever Held on the Pacific Coast

Tractors
Power Farming Machinery
Accessories

Tractors with 4 wheels, tractors with 3 wheels.
Tractors with 2 wheels, tractors with 2 tracks.
Tractors with 2 tracks and 1 wheel.
Tractors with 2 tracks and 2 wheels.
Tractors with 1 track and 2 wheels.
Tractors with one-cylinder engine.
Tractors with two-cylinder engine.
Tractors with four-cylinder engine.
Tractors with eight-cylinder engine.

—of upright, horizontal, single opposed, double opposed, valve-in-head, T-type and L-type—in fact all the types of engine construction.

See them pulling mould-board plows, disc plows, harrows, scrapers and all kinds of farm implements. Remember, there's nothing quite like seeing. At this demonstration there will be tractors to meet every demand for the big and little ranches, for the orchard, grove and vineyard, for hauling, for the pulley.

You will see these tractors at work, doing exactly what they will do for you on your farm. There's no telling equal to seeing. Come to see for yourself. Compare all these power farming tools while they are at work. See them in action as they would be if they were on your farm.

Free Admission. Free Auto Parking. Free Camping Grounds Nearby.

Excellent Restaurant Fully Equipped. Additional Information Upon Request.

California Tractor and Implement Association,

Hotel Land, Sacramento, California.

Cleveland Tractor

DOES MORE THAN PLOW

THE CLEVELAND TRACTOR pulls **rocks out of the** ground, not **itself.**

THE CLEVELAND TRACTOR, because of its track laying construction, travels **on top** of the ground; it plows; it sows; it cultivates; it reaps, and does other work on ranch or road, in **less** time, and at less cost, than with horses or mules.

THE CLEVELAND TRACTOR uses its power to **pull the implement**—not to pull **itself out of the ground.** That is one reason why it operates on so little fuel.

Send for "The Story of Cleveland Tractor Company," illustrated. Free as long as our supply lasts.

"THIRTY MINUTES FROM SERVICE." What it means to the grower when "time is money." It means that in our tractor organization, the **largest** and most **efficient** in Southern California, we have representatives so located throughout all of Southern California and Arizona that nearly every **CLEVELAND TRACTOR** user is within 30 minutes from one of them. Send for his name and address.

Mr. C. E. Everett of North Cambridge St., Orange, Calif., writes under date of March 17th, 1919:

"**My Cleveland Tractor,** bought in June, 1918, has given me every satisfaction. In my opinion it is the only tractor on the market suitable for orchard work, being easily handled, gets closer to the trees, without injury, than with horses. So far my upkeep expense is negligible, while the cost of operation is surprisingly low."

REO

"Oh! You'll Get There All Right —With That Reo!"

A CERTAIN LADY—you know a large percentage of Reo owners and drivers are women—a certain Reo Lady was making a long, cross-country trip accompanied by three other ladies.

WEATHER WAS AWFUL—no other word would describe it. Roads accordingly.

AT MANY PLACES there were detours where modern roads were being built.

YOU KNOW THE KIND—a mile to the south, then a mile to the west, north a mile again to the main road.

HEAVY TRAFFIC on what was never a road, but only a trail, cut ruts hub-deep in the slippery clay and sticky mud.

AND IN THE RUTS were chuck-holes that, concealed from view by mud and slush, had to be ever guarded against.

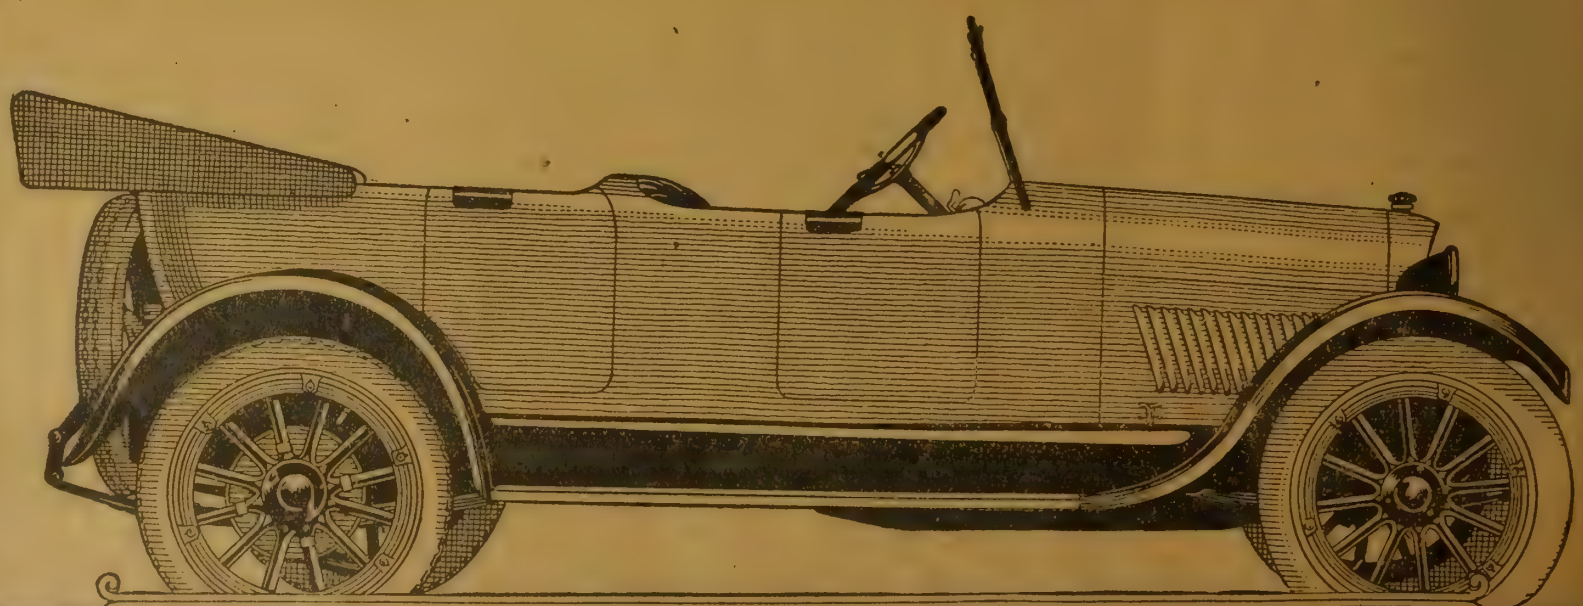
TO HIT ONE at speed were to throw the passengers out of the seats. To drive at more than a snail's pace were to take risks.

TO MAKE MATTERS WORSE, she frequently had to drive off the road and into the ditch in order to pass other cars that were hopelessly stalled.

AT TIMES OUR LADY was dismayed by the look of things ahead, and as she plowed through, drip-pan awash and gears in low, she would stop and ask other wayfarers if it was any worse ahead.

INVARIABLY—so fond are most folk of imparting bad news!—they would say, "Oh, yes—what you have gone through is good beside that next clay hill!"

THEN, CRITICALLY LOOKING at the car, the informant would exclaim confidently, "But you'll get through all right—with that Reo!"



EVERY ONE SHE ASKED knew the Reo on sight—and every one voiced the conviction that, with her Reo, she'd get through all right regardless of how great the distance or how bad the roads.

AND SHE DID, which is merely to chronicle what every Reo owner knows and every owner of every other car concedes.

YOU'LL ALWAYS GET THROUGH—if you have a Reo.

"THERE ARE LOTS of good automobiles —but the man who owns a Reo is lucky."

Reo Motor Car Company, Lansing, Michigan

The Farm Separator: Its Care and Handling

By E. H. Hagemann

ALL separator manufacturers issue books of instructions giving rules and directions for setting up and operating their particular type of machine, which, if followed, will insure good care and successful operation. Some purchasers do not heed these instructions or advice and think they know more about the separator and how it should be handled than does the manufacturer, but such are usually taught expensive lessons. A separator is a very finely made piece of work, and no machinery used on the farm should have better care.

Handling

The operator should aim to secure two things if he expects the separator to do good work: First, a perfectly true motion of the bowl, and second, a sufficient uniform speed. If the bowl or separator shakes or vibrates while skimming there will be some remixing of the milk and cream and poor skimming will be the result. It is one of the first objects of the manufacturers to design a separator which is thoroughly balanced, and smooth in operation.

Any noticeable shaking or vibrating of the machine will invariably cause unnecessary loss of butter fat and shorten the life of the machine materially, and if the vibration becomes too violent at the high speed of skimming, it may be the cause of material damage as well.

In order to have a true motion of the bowl, the machine must be set level, be kept clean and well oiled. The oil should be thin, such as is recommended by the manufacturers. All bearings should be frequently flushed with coal oil to keep the parts free from gum, grit, etc. The separator should be set up on a good solid floor on foundation, so that it cannot move when operated.

Principle of Separation

It has long been known that centrifugal force would separate two substances of different specific gravities. The simplest way of demonstrating the principle of centrifugal cream separation is by rapidly spinning a pail filled with milk or other liquid. It will be noticed that the milk will climb upwards at the sides and sink away in the center. The force which makes the milk bank up against the sides of the pail is centrifugal force, and this, in holding the milk to the sides of the pail, of course exerts considerable pressure. Now then, if the pail were covered at the top so that the milk could not flow over the edges and it could be turned as fast as a separator bowl, none of the milk would remain in the bottom but would form a wall from top to bottom all around the inside of the pail. The pressure of the milk would become very great and the light cream particles would be squeezed out of place by the heavier skim-milk particles and a layer of cream extending from top to bottom of the pail would form on the inside of the wall of liquid. The cream particles fall back to the inside simply because they are lighter than the skim-milk particles and cannot hold their position in the body of milk against the great pressure of the heavier skim-milk particles.

Speed of Machine

Uniform speed such as is indicated in the instruction book packed with each machine should be kept up during the entire run. Much careless work is done in not keeping up a uniform speed. Too many guess at the speed, or the operator becomes tired or careless and unconsciously slacks up on the crank, and poor skimming is the result. If a separator is turned by hand the crank should be turned a given number of times per minute, and if run by engine see that all belts are tight at all times. If a separator is run at low speed the separation will be incomplete and the cream will be thin, also there will be a loss of butter fat in the skim milk. The bowl of the separator should be up to full speed before turning in the milk. Each machine has a rated capacity, and more milk than the capacity should not be crowded through. When purchasing a separator it is better to get one a little larger than necessary, than one too small.

The faster the milk passes through the bowl, the shorter the period in which the centrifugal force acts on it and the less complete is the separation. On the other hand the less milk going through the thicker will be the cream and the cleaner the separation.

Temperature of the Milk

The warmer the milk the more fluid. Cold milk is more viscous or less fluid than warm milk and the cream will not separate so readily. The milk should be separated as quickly as possible after milking or at a temperature not less than 84 to 86 degrees Fahrenheit. Then the skimming will be cleanest and the skim milk and cream better.

Use of the Cream Screw

The test of the cream varies with the speed of the bowl, the temperature of the milk, the amount of milk passing through the bowl, and the change of season when the cows are fresh and become strippers. These factors are usually overcome by adjusting the cream screw to make allowance for these changes.

Sanitary Condition of Separator

Much cream gets its start of fermentation and souring by skimming with an unclean separator. Many dairymen do not realize how quickly milk or cream can become unfit for a food article if it is not kept clean and handled in clean vessels. The slime and solid particles of dirt and unclean matter in the milk that are caught and held in the bowl are at just the right temperature to decay, and an evil smell develops in a few minutes. It is therefore evident that the milk must not pass over this decayed sour matter in the bowl from a second milking before it has been thoroughly cleansed. Dish cloths should not be used for washing dairy utensils. A good brush and a soda washing powder are best. Have plenty of hot water and scrub every part. Pour boiling hot water over bowl parts, scrubbing them and place them in the sun or dry place to drain.

When the bowl parts are again assembled for the next skimming care should be used that they are properly put together, and that all internal devices of the bowl, discs or other parts, are assembled according to number or other marks. No bowl parts should receive rough handling, allowing them to drop to the floor, etc. Such carelessness will soon cause the separator bowl to get out of balance.

Hard Work, Fun and Information

A HALF a hundred alleged automobiles, with dust covered occupants full of interrogation marks, moving from county to county, caused some little comment during the past few weeks. These men were all farm bureau directors or the advisers of various counties from Shasta to San Diego. They had met in Davis, later in Berkeley, had discussed the problems of the farmer and the best means of aiding in the solving of these problems. Then, in order to fill up on information which would aid in the trouble shooting game they drove from Berkeley down the east side of the bay and through Santa Clara County, thence south through other Coast counties to Santa Barbara, Ventura, Los Angeles, Orange, San Bernardino, Riverside. At nearly every county line they were met by delegations loaded with oranges.

The farm bureaus in each county vied with each other in giving a good time and incidentally advice as to the best county on earth in which to settle. Luncheons, dinners and banquets were provided so that good things were to be obtained. In Los Angeles County special arrangements were made by the farm bureau for luncheon on the Santa Anita ranch, after a forenoon in the San Fernando valley. Later the Holstein cattle were used by Mr. Scribner of the Los Angeles County farm bureau to teach the lesson of proper dairy cow selection Adjournment was then had to the piggery where Banker's Boy and other pure bred Poland-Chinas were used to demonstrate hog values.

Farm Advisers Getting Advised

This is one of several dozen such features which were staged during the farm bureau traveling convention which started at Berkeley and reached to Riverside. This is pruning demonstration and lecture given in North Whittier, Los Angeles County. The man holding the chart, his face just appearing above it, is Farm Adviser Coit, while the man dressed in galluses is Assistant Hodgson addressing the conference. After the short preliminary talk, a lemon tree in need of pruning was thoroughly pruned, with reason given for each cut made.

Later in the afternoon on the way to Orange County stop was made at North Whittier Heights, where Adviser Hodgson demonstrated and explained methods of lemon pruning, then over Turnbull Canyon, through Whittier and La Habra Valley, to Fullerton, where dinner was served in the high school cafeteria. The evening was given over to discussion of farm bureau matters and talks on marketing and to selection of root stocks for citrus trees.

After this session lasting until nearly midnight the entire bunch was ready for bugle call at six the next morning, and Orange County, a portion of Los Angeles County again and San Bernardino County were done the following day. The event ended with session at the citrus experiment station at Riverside and a banquet at Mission Inn.

At this last banquet those participating in the trip united in presenting to Walter E. Packard, assistant leader for the South, a beautiful gold chain and gold knife attached.

This because of service rendered and in honor of his departure for France, where he is to serve the federal government in giving agricultural instruction and information as to federal land settlement to soldiers still serving abroad.

Dean Hunt accompanied the party as far south as Ventura and claimed his share of the dust and travel stain. State Leader Crocheron was dad to the whole bunch.

Assistant Leaders Nelson and Ha-

Agricultural News Notes of the Pacific Coast

Northern California

Quincy, Plumas County, is increasing its pure bred dairy herds.

A Yolo County farmer is discussing the matter of tobacco culture.

The area planted to rice in Yolo County this season will exceed 30,000 acres.

Commissioner Cody of Santa Clara reports slight damage to prunes this season from thrips.

One concern in Eldorado County has finished planting 8000 pear trees on its property near Five-Mile House.

Bullard, the Yolo County sheep grower, has just received 100 head of choice Rambouillets from South Africa.

Squirrel control people the state over are planning for a big spring drive. Shasta County's began on March 17.

Commissioner Stoupe of Shasta County has purchased 200 ounces of strychnine to distribute in squirred fighting campaign.

Community grazing is being discussed by cattlemen near Grass Valley, Nevada County. Three hundred head have been pledged.

The Delta section is planning for its biggest and best asparagus crop. The cannery at Rio Vista has greatly increased its capacity.

George Compere, formerly with the state horticultural commission, is now with the federal horticultural board and serving at New Orleans.

San Joaquin County farm center meetings: Tracy, April 11; Directors' meeting, Stockton, 12; Lockeford, 14; Ripon, 17; Manteca, 18; Escalon, 21; Live Oak, 28.

Harry Stabler, horticultural commissioner of Sutter County, has prevented entrance to the county of several shipments of meally bugs on ornamental plants.

W. I. Newcomb of Sonoma County has been making inspections for the state horticultural commissioner and reports outlook in Sacramento Valley as fine for immense crops.

County Horticultural Commissioner Norton of Nevada County reports less than one per cent of last year's pears were found to be infested with scab. The spraying campaign accounts for the success.

Eldorado County farm bureau is advocating a "Clean-up of Home Grounds Week." Prizes will be awarded for cleanest home grounds in town, on the farm, the best painted house and the best whitewashed barn.

The litigation between the Holt Manufacturing Company and the Daniel Best Manufacturing Company has been ended and the Holt Manufacturing Company has been declared the rightful owner of the Caterpillar patents.

President Rieker of the Associated Swine Breeders, Inc., is being sought under warrant charging passing of worthless check. This association has no connection with the California Swine Breeders which is a Simon-pure cooperative association.

Horticultural Commissioner Dutton of Mendocino County made this season a specially strong campaign against pear scab. Commissioner Hecke announces the April Monthly Bulletin will have authorized estimates of California's fruit crop.

Central California

April 5 was Blossom Day in the Santa Clara Valley.

The Modesto farm bureau will hold a fat hog auction April 18.

Kings County's first rabbit drive was held Sunday, March 30.

Tegner, Stanislaus County, recently held a rabbit drive netting about 200 rabbits.

John W. Dixon has been appointed horticultural commissioner of Inyo County.

Kings County grapes are already being contracted for for next fall's delivery.

Oakdale, Stanislaus County, has shipped several cars of prime steers to Los Angeles.

Kings County fair directors met in Hanford Monday to discuss next season's fair dates.

The state's $40,000,000 road bond campaign has enthusiastic support in the San Joaquin Valley.

J. M. Bomberger, the Tulare County alfalfa seed grower, has disposed of his ranch and his pure bred stock.

Fresno County's good roads association has formally launched a campaign for a $4,600,000 county highway fund.

The California Peach Growers, Incorporated, is signing up with the growers the new three year contract.

Members of the Turlock and Modesto irrigation districts are urging the passage of the Broughton power bill.

San Joaquin County plans organization of a county branch of The Farm Owners and Operators National Association.

County Commissioner Rutherford of Stanislaus County is appealing for general observation of the noxious weed drive.

Sealers of weights and measures in the central part of the state will soon take charge of the weighing in of milk and cream.

The money invested in California lands devoted to cattle culture and in the cattle is now estimated to aggregate $350,000,000.

County Horticultural Commissioner Rutherford of Stanislaus reports satisfactory control of the grasshopper pest by blackbirds.

Deciduous fruit growers of Madera County have organized association for packing and selling fresh fruits. Headquarters are at Madera.

Fred Howard, horticultural commissioner of Kings County, has been chosen general manager of the California Honey Producers Cooperative Exchange.

Kings County's semi-monthly fat hog sale resulted in some sales at 40 cents above quotations in San Francisco and Los Angeles. Seventy-nine of the hogs average $18.40.

County Horticultural Commissioner Fred K. Howard of Kings County has been cooperating with Prof. Barrett of the Riverside experiment station in an investigation of apricot gummosis in Kings County.

County Horticultural Commissioner Collins of Tulare has issued a bulletin covering noxious insects, plant diseases and rodent control in Tulare County. San Luis Obispo County has a new horticultural commissioner, Harold E. Alley.

Southern California

The Santa Ana Walnut Association has a large cracking plant .

Fullerton district reports very light planting of potatoes as yet.

Orange County walnut groves produced over 4000 tons of walnuts last year.

Large plantings of date offshoots are reported being made in the Coachella Valley.

The Winningstadt cabbage crop in the San Fernando Valley is practically cleaned up.

Apricot growers of Nuevo, Riverside County, have formed a marketing association.

J. H. Peck of Calexico has purchased several fine Holsteins at the Guaranty Sale at Sacramento.

President Turner of the California Bean Growers' Association has gone to New York to start a campaign to sell beans.

Navels, Seedlings and varieties of oranges other than Valencias will practically all be shipped before the end of April.

Announcement has been made that the new bean pool has fixed starting selling prices at $6.75 for limas and $6.50 for Bush Henderson.

Farmers of the Imperial Valley have formed a cooperative organization. Questions of irrigation and labor will be among the first taken up.

The Cuyama road, to connect Santa Barbara with Bakersfield, has some strong backers who are working in the legislature for an appropriation for its construction.

Manager Coykendall and H. C. Dunlap of the California Prune and Apricot Growers' Association have been in Santa Ana talking with growers as to marketing problems.

W. E. Packard, for years in charge of the experiment farm in the Imperial Valley, has been appointed to the army educational commission and will soon go to Europe to lecture before our soldiers on farm settlement.

The bee men of San Bernardino County have formed an organization of which H. T. Wagner of Redlands has been elected president, H. S. Burnham of Mentone, vice-President, and J. A. Mack of Bloomington, secretary.

The bean growers' pool, recently formed at Oxnard, appointed a committee to name prices at which selling should be started. The committee is J. M. Waterman, A. Levy, R. L. Churchill, Charles Donlon, C. C. Teague, W. J. Petit, A. J. Cruikshank, Roger G. Edwards and A. Camarillo.

Effort is being made in Ventura County to form a big Lima bean pool to take in the independent growers and dealers. By the provisions of the pool members may not dispose of beans outside the pool until after September 1, when they may withdraw if they have given 30 days written notice.

Rhubarb is moving out in carloads to the East, but prices are abnormally high,—about 30 per cent higher than this time last year, which is caused by active competition between buyers. Indications are, however, that receipts will be more liberal during the coming week and if Eastern demand falls off, which is probable, and if southern Illinois begins to ship, prices will decline materially.

The Coast and General

Florida "pineapple" oranges have sold in New York as high as $8.00 per box.

Cherry growers of The Dalles, Oregon, have formed a marketing association.

Chandler, Arizona, claims to have the leading agricultural high school in the state.

Hood River Valley, Oregon, reports apple and pear trees in fine condition and blossoms indicating average crop.

Producers of asparagus in Yakima, Washington, are experimenting largely this season in the use of nitrate of soda in asparagus production.

Beekeepers of Bellingham, Washington, have organized a marketing association. The annual output of the district is about 30,000 pounds honey.

Eighteen to 20 carloads of apples daily are being shipped from the Wenatchee district of Washington. More than 8000 carloads have already been sent out.

The farms of the United States have 3,000,000 hired men. As the census reports 12,500,000 engaged in agriculture, it is to be presumed that most of us are land owners.

The Rogue River Valley, Oregon, is hoping for a new irrigation district which will cover about 8000 acres. The Medford irrigation district has about 20,000 acres under water.

New York bean browers are charging that in filling government orders for beans purchases were made only from a "favored few" through the offices of interested "dollar a year" men.

Ten cars loaded with apples and equipped with the new heating appliances being tested out by the United States bureau of markets have left Wenatchee for the East, accompanied by expert observers.

The farmers of Graham County, using water from the Gila River, are at last organized as the Gila River Valley Water Users' Association. The primary purpose of this organization is to secure government assistance in building a storage reservoir on the upper Gila, Arizona.

Final returns to members of the Apple Growers' Association of Hood River, Oregon, will exceed $1,225,000 for the apple and pear crop and with the return from cherries and strawberries, the net business of 1918 is more than $1,500,000. This is the first year since 1911 that collections have all been made by this date.

The Oregon legislature has appropriated $4000 annually for maintenance of an experiment station to be located in the Hood River Valley. Hood River County will purchase a tract of land suitable for the home of the institution, and a permanent experiment station will be erected. The station will be administered by the Oregon agricultural college.

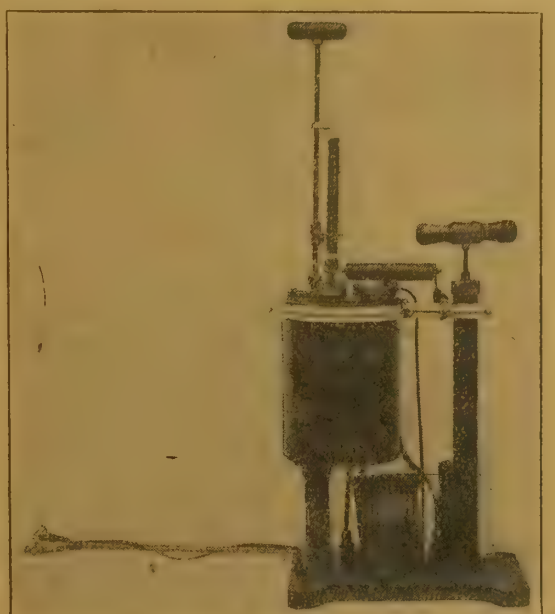
Florida dairymen have held the first annual meeting of their new association. The work as planned for the coming year includes a campaign for statewide eradication of cattle fever ticks; energetic effort to prevent any changes in present regulations governing manufacture, sale and distribution of oleomargarine and the securing of an appropriation by the legislature for an experienced dairy extension worker.

Fumigation With Liquid Hydrocyanic Acid

Address by R. S. Woglum Before American Association of Economic Entomologists

THE fumigation of citrus trees with hydrocyanic acid gas has been performed in California for more than 30 years, and during this period more radical changes in apparatus and methods have occurred than is to be found in the annals of any other insecticide either in this state or elsewhere. The original so-called "dry gas" process in which undiluted sulphuric acid was poured slowly into a cyanid solution, the resultant gas passing through a sulphuric acid bath, gave way in 1890 to the "pot method," which consists of placing dry cyanid with diluted sulphuric acid in an open vessel beneath the tented tree. In 1912 a simplified portable machine for generating cyanid gas outside the tent was invented, and this method of application rapidly and sucessfully displaced the "pot method." The latest development, liquid hydrocyanic acid, has proved the most revolutionary of all changes in field fumigation, promising ultimately to completely supersede current practices.

In 1915 C. W. Mally, working in South Africa. prepared and experimented with liquid hydrocyanic acid. It happened that William Dingle of Los Angeles, one of the inventors of the machine method of generation, began to develop simultaneously but entirely independently, the same method and in the early spring of 1916 publicly demonstrated the fumigation of citrus trees with liquid hydrocyanic acid.



Liquid hydrocyanic acid is by no means new, having been known to chemists for many years. In its pure state it is a colorless liquid with a specific gravity of .70 at 65 degrees Fahrenheit. The high volatility of this substance (it boils at 80 degrees Fahrenheit) produces easy gasification at the ordinary temperatures of fumigation. If impure it decomposes rapidly.

The application of this gas to the tented tree is extremely simple. A tank, suitably vented, holding about two gallons, is mounted on a platform with a measuring device and a pump (see figure). The liquid hydrocyanic acid, after measurement into storage coils, is forcibly discharged through a short rod fitted with a mist type of spray nozzle and quickly disappears as an invisible gas.

During the season of 1917 approximately 540,000 pounds of solid sodium cyanid were converted into liquid hydrocyanic acid for the use of 30 fumigation outfits. So far this year more than one million pounds of sodium cyanid have been similarly treated for the use of 94 fumigation crews. A very much greater amount would have been used could it have been produced.

Gas Distribution

It has been the writer's belief for many years that gas distribution is influenced by the method of application or generation and in 1908 this led to the invention of a cover device for deflecting the rise of gas from a generating vessel. In pot fumigation a dense column of gas rises rapidly from the generator until deflected by the branches, foliage and ultimately the tent. The spreading of the gas through the lower part of the tree follows the forcing downward of the diffused column after contact with the tent top. This initial condition would point to the top of the tent receiving maximum gas distribution sooner than the bottom. Furthermore, the effect of the rise of gas would tend to cause a greater concentration toward the top, although in a non-gastight enclosure such as a tented tree, various factors, as yet little understood, are constantly exerting important influences, changes in which must alter the movement of the gas particles to no little extent. The diffusion through the tenting is most important and unquestionably is modified by such factors as texture, its condition as to moisture, chemical treatment and accumulation of dirt particles. Furthermore, atmospheric conditions during the exposure have been proven to influence scale-kill, thus probably affecting tent leakage. Factors acting wholly within the tent, yet believed to affect gas concentration to some extent, are absorption and adsorption of the foliage and the physical condition of the soil.

For Application of Liquid Hydrocyanic Acid Gas

This is the best type of pump or machine for applying liquid gas, and is the one pump used almost exclusively in 1918. Liquid gas has many advantages, and will be used more the coming season than ever.

The violence of the reaction in an open generating vessel affects the denseness and velocity of the rising column of hydrocyanic acid gas. When the reaction is rapid the initial maximum gas concentration must needs follow more quickly than when the generation takes place over a protracted period. Furthermore, consideration of the fact that leakage occurs immediately on contact of the gas with the tent surface, injects a factor that might alter the maximum gas density attained between a slow or rapid generation. Such a view would signify a difference, possibly very slight, in pot generated gas from potassium and sodium cyanid respectively, for solid potassium cyanid produces a violent reaction practically complete within one to three minutes. Solid sodium cyanid, on the other hand, is much slower in generation and low grade material used in California to a limited extent several years ago was observed in some cases to require fully 15 minutes for complete liberation of gas.

The gas evolved from fumigating machines is in the form of a dense cloud injected with much force at one edge of the tent along the ground. The evolution of the gas is almost instantaneous and in a different initial direction to that of pot generation. Thus the condition surrounding the concentration and distribution of this gas, in differing from that generated in vessels within the tented tree, gives grounds for possible difference in results between the two methods.

After this brief discussion of gas distribution in pot and machine practice, let us consider liquid hydrocyanic acid. This latter is injected at the edge of the tent with a small amount of force, as a mist, which on evaporating is left with little initial momentum. The result is a gas somewhat distributed toward the bottom of the tent, having much less initial velocity than in the case of gas generated under former methods. Furthermore, the gas from liquid hydrocyanic acid is cooled almost to the freezing point on formation and consequently is decidedly heavier than the hot machine or pot generated product (temperature of pot generated gas is 100 degrees to 153 degrees in accordance with dosage).

Since the molecular activity of gases increases proportionately as the temperature, it is evident that we have a very differently acting product in the new than in the old practice. The molecular activity of gas from liquid hydrocyanic acid is least when first generated but increases as it attains the temperature of the air, while in pot or machine generated gas quite the inverse is true, the initial molecular velocity of these being the greatest and decreasing as the gas cools to the lower air temperature. Thus it is evident that initial diffusion would be slower in the case of liquid hydrocyanic acid, and attained throughout the bottom of the tent sooner than the top. Differences in diffusion and molecular activity would signify a difference in tent leakage between the generated and atomized gas and that such takes place under field conditions is readily detectable by careful observation.

The destruction of scale pests on citrus trees is proportional to gas concentration and hydrocyanic acid gas being lighter than air, it is natural to presume that the greatest density, signifying the best scale kill, is toward the top of the tent. This presumption has been supported by the observation of practical fumigators and the experiments of investigators, of whom one of the first to give definite proof in support of this condition was Morrill in 1908, working in Florida with the citrus white fly, Dialeurodes citri. More recently Quayle conducted tests under tent forms with the bean weevil (Acanthoscelides obtectus) and the granary weevil (Calandra granaria) arriving at the same general conclusion, that the highest mortality is toward the top of the tent. Quayle, however, concluded that the percentage killed in the case of a tall tree is better toward the center than the top, a conclusion not in keeping with the data presented.

The writer has been conducting an investigation of the use of liquid hydrocyanic acid with special reference to dosage requirements and during the past season has closely followed the fumigation of more than 500 acres of citrus trees. It was felt that the difference in physical properties between gas obtained from liquid and field generated hydrocyanic acid is sufficient to demand a careful revision of the dosage schedule originally prepared for pot generated gas, but subsequently also adopted for machine and liquid hydrocyanic acid fumigation.

Accordingly gas diffusion was one of the first problems taken up, the determination of which was undertaken entomologically by obtaining data on scale-kill in different parts of tented trees.

The results of these experiments demonstrate that the scale-kill with liquid hyrocyanic acid as at present used is decidedly better toward the lower part of the tent than toward the top. This result was plainly shown in each of the trees which comprised these tests as well as in the totals. Scale infested units within a few inches of the ground showed a higher mortality than units in the tops of tall trees.

By the use of liquid hydrocyanic acid gas it was found that 91.15 per cent of the scale insects were killed in the top of the tree, while in the bottom of the tree 96.59 per cent were killed. In contrast experiments have by Morrill with pot generated gas showed 71 per cent kill in the top and 64 per cent in the bottom, and experiments by Quayle showed 65.6 per cent kill in top and 38.8 in bottom.

A striking difference between these results and those with liquid hydrocyanic acid is shown, the mortality with the latter being decidedly the greatest toward the bottom of the tent. In fact the percentage of mortality for liquid hydrocyanic acid in favor of the bottom of the tent is almost inversely proportionate to Morrill's results with pot fumigation for the top. It should be noted that the experiments with liquid hydrocyanic acid were carried on at comparatively high temperatures. Fumigation at very low temperatures would tend to develop even greater differences in scale-kill at various distances from the ground.

This greater density of gas toward the bottom of the tent with corresponding increased efficiency will necessitate changes in the present dosage schedule based on pot generation. A dosage schedule for liquid hydrocyanic acid is now being prepared and will be ready for the coming season's work.

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertisers in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

THIS WEEK'S COVER

Nearly all the people shown on the cover this week are turning their backs on Cultivator readers, but this was because they were looking at a $1000 hog. This scene was in the grounds near the piggery of the Santa Anita Ranch near Los Angeles and shows one of the most interesting sessions held during the farm bureau traveling conference. Banker's Boy is the center of attraction. He was purchased by Manager Taylor of M. Bassett and was used as an object lesson in showing the farm bureau people the advantage of the pure bred boar.

BACK ON THE JOB

The boys are coming home, some from across, some from the cantonments, some from the shipyards, and from all kinds of activities which meant the winning of the war. Amongst others are A. M. Nelson, formerly with the 91st Division, who comes to his home county, Imperial, where he will take up his former work of agricultural publicity agent. Mr. Nelson went over the top in the Argonne. Another Imperial County boy is still with the army of occupation, Paul I. Dougherty, former farm adviser.

CALIFORNIA

Did anybody ever see the poppies brighter or larger or the wild flowers more plentiful or more beautiful, or the hills greener than this year?

It's just springtime in good old California.

SUCKERS

Funny, how many of us in this world are just plain suckers! This stands out in every daily newspaper which chronicles the work of some confidence game on some over-confiding man. The principal American sport during the past few months has been the exchanging of worthless "stocks" or "bonds" for Liberty Bonds. It is said by those who have investigated that it is astounding the number of people who have been bilked in this manner. From the treasury department we have this statement:

"The American people are paying out some half billion dollars a year to the support of worthless stock schemes. The people reap therefrom $500,000,000 worth of—thin air."

It is true there has been depreciation on Liberty Bonds, but if we could all have held our bonds there would have been no depreciation.

CARELESSNESS COSTS

The National Board of Fire Underwriters is sending out a fund of valuable information in the hope of inducing greater carefulness in disposal of cigarette stubs and burnt matches, on the part of the hunter, with his gun, and a dozen and one other manifestations of thoughtlessness which may cause loss of property or life. The campaign is to be taken up in America's great character factory, the public school, and 25,000,000 pupils are to be taught the advantage to the country of preventing this loss.

This campaign should appeal to Californians. Every drop of water here is of greater value than in any section of the world, and our water supply depends largely upon our watersheds. We believe no section of the country has suffered as has the Pacific Coast from carelessness in starting forest fires.

FUTURE OF BEEF

For some time we have watched with satisfaction the increased interest manifested among beef cattle men and we are glad to use this issue of the Cultivator in an effort to further the industry.

We believe that California has a great future in beef production. This state has every natural condition essential to such development.

However, times have changed and from now on cattlemen will be forced to give more careful attention to the details of their operations. Better bulls must come into use more extensively; modern methods of range management, including range control, winter feed provisions, water development, disease control, elimination of predatory animals, stronger calf crops and a hundred other details, must be considered; a more efficient marketing system must be evolved, and this can only come through organized effort.

Because we are certain that all these things will come in time, we are equally certain that the future holds much in store for the pure bred business, and we are but voicing common knowledge when we state that California offers one of the most attractive fields for the establishment of herds of pure bred beef cattle to be found anywhere in the world. No state, comparable to California, is as poorly provided with seed herds.

Any man, who likes the business and is qualified, need have no hesitancy in entering the pure bred beef cattle business—if he enters it along sane and conservative lines.

THE BEAN SITUATION

Between the culpability and the mistakes of some connected with the food administration and more mistakes made by some handlers of beans, all combined with last year's enormous production at the end of the war, there has resulted a cutting of more than half in the price of beans which obtained six months ago. Worse than all, no reasonable price—nor even unreasonable—has been obtainable. The situation has now been materially cleared and the market is already stiffening because of the formation of a pool to dispose of Limas at a price which will result in as little loss to the growers as possible. The pool consists of those already organized in the Lima Bean Association, together with outsiders, shippers, commission men and others. An executive committee consisting of J. M. Waterman, A. Levy, R. L. Churchill, Charles Donlon, C. C. Teague, W. J. Petit, A. J. Cruickshank, Roger G. Edwards and A. Camarillo has been named. E. O. Essig, formerly farm adviser of Ventura County, has been chosen secretary and manager of the new association.

This pool will be known as the Lima Bean Selling Agency, though it has appointed the A. & H. Levy Co., the J. M. Waterman Selling Agency, and the California Lima Bean Growers Association as special selling agents. Other dealers may become selling agents on application to the executive committee. Every grower uniting in this pool signs a contract transferring to the executive committee entire power over his crop.

This organization is the result of necessity on the part of the growers and interest taken in the situation by bankers of Los Angeles, Ventura and Orange Counties.

It is to be expected that this reconstruction period will bring serious problems to all manufacturers and producers, but none have suffered so severely as the bean growers.

LIONS AND LAMBS

All are familiar with the prophecy that the time will come when the lion and the lamb will reach a state of mental trust wherein the meekly ovine will go so far as to lie down without fear of the king of beasts. For the past few years there has existed slight evidence that the prophecy is likely to come to pass, but occasionally one, if he looked carefully, has been able to see a dim light in the turbulent world's affairs that might serve to strengthen his hope. Quite recently a new bit of evidence has manifested itself. It comes in the form of an announcement that representative live stock producers of the East, the packing interests and representatives of the United States bureau of markets met in a friendly way and outlined a plan for harmonizing all live stock interests to the end that producers might feel safe in approaching their arch enemies, the packers, with a fair hope that they could sit down together and discuss their differences and problems, and that these matters could be solved to the satisfaction of all.

Surely the world does move! Apparently the packing interests have seen the handwriting on the wall and have decided that the time has about arrived when if they are to be permitted to exist it will be highly necessary that they cut loose from their former "square headed" policy of operating their business on a public be damned plan, wherein the producer and consumer were regarded as fair game.

We believe there is wide possibility in the announced plan and we trust that some such plan will be born and live and function as a real force in live stock marketing affairs.

SHOULD BE SHACKLED

A lover of Roosevelt has picked upon this one epigrammatic utterance as his greatest: "The time is coming when we must shackle cunning as in the past we have shackled force."

If the time for shackling cunning is here it calls for more effective effort on the part of the American people than they have yet manifested. Many laudable steps have been taken which have resulted in its partial shackling, but cunning is much more difficult to overcome than mere force. Whether it be in political or in commercial life, cunning is strongly entrenched and will persist in perpetuating itself until the mass of us get together with more cooperative force than we have yet shown.

VOCATIONAL TRAINING

The federal board of vocational education has listed something over 22,000 partially disabled wounded men who are being investigated, and many of them will be given attention which will aid them in their life work. The board asks for information as to these men who have been at the front and who have been drafted out of service without availing themselves of the advantages which the government is offering them. It would be far better for the government and for the men if the ability may be secured to earn a good living and independence.

VICTORY LOAN

The government is letting out now and then an ocasional war secret which throws more light on the necessity for the big Victory Loan which this month is to see raised. One of these secrets was in effect that this war ended nearly 12 months before the American people anticipated. The Germans were not licked to the condition which most Americans desired. However, it is now allowed to leak out that the Germans did know of the wonderfully complete preparation America was making to give them their complete trouncing, and regarding this preparation it is now admitted that this country had provided for a tank for every 75 feet of the front which was to be occupied by the American armies. There were billions of dollars worth of shells, of ships, and monster guns to an extent greater than all the preparation of England, France and Germany.

Now the question is: "Were all these billions of dollars worth of supplies wasted?" America's keenest observers are answering in effect that these billions of dollars which were apparently wasted have saved one hundred to two hundred thousand American lives, and probably even more of our boys would have died on foreign soil if the Hun had not known that we were in the war to win.

Hence the appeal is made to pay the bill which has been accrued for the sake of saving the lives of our own boys.

Subscribe for the Victory Loan. Payments required are ten per cent at time of subscription or at least before May 10, ten per cent on or before July 15, 20 per cent on or before August 12, 20 per cent on or before September 9, 20 per cent on or before October 7, and the balance of 20 per cent on or before November 11, with accrued interest on deferred installments.

Put New Life In Your Engine

A dose of Johnson's Carbon Remover, the engine laxative, will cure 80% of engine troubles. It will increase the power of your car—improve acceleration—stop that knock—quiet your motor—save your batteries—cut down repair bills—and reduce your gas and oil consumption.

Don't wait until your motor is choked with carbon—remove it every week or two with Johnson's Carbon Remover. You can do it yourself in five minutes—no mechanical experience required. You will save from $3.00 to $5.00 over any other method of carbon removal without laying up your car and with very much better results.

JOHNSON'S CARBON REMOVER

is an absolutely harmless liquid to be poured or squirted into the cylinders. It contains no acids and does not affect lubrication or interfere with the oil in the crank case. Recommended by many of the leading car manufacturers including the Packard and Studebaker Companies.

For Tractors—Gas Engines

Johnson's Carbon Remover will also remove carbon from the motor of your tractor, giving it greater power and enabling it to work more satisfactorily and economically. It will make your tractor 100% efficient.

Johnson's Carbon Remover is for sale by Hardware, Accessory dealers and Garages. Send for our booklet on Keeping Cars Young—it's free.

S. C. JOHNSON & SON, Dept. CC Racine, Wis
Established 1882

AUCTION SALE
TUESDAY, APRIL 15

1 1-2 miles east of McFarland, Kern Co. Cal.

The following property:

40 acres improved fruit and alfalfa ranch as follows:
18 1-2 acres bearing French Prunes, 5 years old.
5 acres in almonds, 4 years old, three different varieties.
5 acres in alfalfa.
9 1-2 acres for grain or other crops.
Ten inch cement pipe line over entire place for irrigating.
Good 4 room bungalow with screen porches, tank house with two rooms.
Two barns, chicken house and corrals, water piped into corrals.
Room for 400 chickens.
Domestic fruit orchard, shade trees.
Electric pumping plant, abundance of water.
Everything in good condition, an opportunity for some one which may never occur again.
Also the following live stock and implements:
One large team of mules and harness; one medium sorrel mare and harness; one light spring wagon; one Deering mowing machine; one hay rake; one Planet Junior Orchard cultivator; one spring tooth harrow; one spike; one two horse walking plow; one two horse lister; one two horse Ventura bean cutter; one three horse Fresno scraper; one single horse cultivator; also shovels, hay forks, etc.
Terms will be given on date of sale.
It will pay anyone contemplating purchasing an improved place to investigate this property and wait for this sale which you can purchase at your own figure.

O. S. GRANT, Auctioneer.
J. SCHNEIDER, McFarland, Cal.

There is no argument as to the best and cheapest source of available nitrogen for worn out frosted orchards. Where

Nitrate of Soda

is used the fruit never fails to set. Apply to orchard now for best results.

Mention crops interested in when writing for free information and literature.

CALIFORNIA WALNUT GROWERS' FIRST CICULAR

The 1919 crop of California walnuts is just commencing to set. The trees that have leaved out thus far carry a uniformly good setting of nuts. Thus if the season progresses favorably from now on, and in consideration of the normal increase due to young acreage just coming into bearing and a heavy acreage of partially bearing trees which are almost doubling their production annually, California should turn out considerably the largest walnut crop in 1919 that has ever been harvested. In fact, with the young acreage coming on the walnut tonnage should about double in the next five years.

Southern California has experienced a winter season of unusually short rainfall, less than we have had during any season for the past ten years, but as most of the walnut groves are already under irrigation systems the shortage of moisture will not seriously affect the crop prospects in general.

It should be borne in mind that practically all the plantings during the last ten years have been of the Budded. Consequently the increase in the crop from now on will be represented almost entirely by Budded walnuts. As the output of this variety increases the differential over No. 1's will naturally decrease, and for 1919 it is probable that the differential will not be above two and one-half cents. As the Budded nut carries a thinner shell and higher cracking standard, the percentage of walnut meats (edible matter) to total weight is considerably greater than on the Soft Shells. Thus from a food value standpoint even at a five-cent differential the Budded is a cheaper food than the Soft Shell. The Budded also is easier to crack, carries a sweeter meat and is thus really the best buy in our line. The distributor who pushes the Budded nut is pushing the coming variety whereas the jobber that stays entirely with the Soft Shell is featuring a nut that will, in time, become entirely extinct the same as the old hardshell has.

We are just now approaching the period when normally more California walnuts are consumed than at any time of the year with the exception of the holiday period, Thanksgiving and Christmas. This other normally heavy consuming period is during the Jewish holidays, April 17 to 24, inclusive, and Easter; April 20. Every retail dealer should have a stock of Diamond Brand walnuts to take care of the Jewish holiday and Easter trade and should see that these goods are prominently displayed. A letter from Zanesville, Ohio, representative, conclusively proves our contention that from five to ten times as many California walnuts are sold when displayed as otherwise. Mrs. Consumer buys such items as fruit and nuts with her eye. The eye makes the appeal to the palate which prompts the purchase. Therefore may we not ask that you particularly urge your salesmen to talk walnut displays to their retail customers.

AVOCADO ASSOCIATION ANNUAL

The directors of the California Avocado Association met at Hotel Green, Pasadena, recently and selected dates for the next annual meeting. A most interesting program has been arranged. The annual will be held at Hotel Maryland, Pasadena, May 9 and 10.

The first session on Friday morning will be devoted to the business of the association and will be open to members only. The first feature of the Friday afternoon session will be the annual address of President W. H. Sallmon. The rest of the afternoon and Saturday forenoon will be devoted to papers and addresses. Saturday afternoon's program will be somewhat out of the ordinary, being given entirely to discussion of the industry, both from a business or marketing and from a cultural standpoint. Friday evening's program will consist of a dinner at Hotel Maryland, to be followed by responses to toasts, together with any unfinished business left from previous sessions.

The association has had a most prosperous year, 52 members being added. W. L. Hardin is the secretary. His address is 623 South San Pedro Street, Los Angeles.

No. 12

Top Dressing Talks

WHY do we call ARCADIAN Sulphate of Ammonia

The Great American Ammoniate

Because it is made in America from American coal in American plants, and is the only important and promising source that we have within our own borders. American farmers are wise to use it and develop its full possibilities. Furthermore, it is the best top dressing material for all crops that need nitrogen, because it is soluble, quick-acting, non-leaching, all available and always easy to spread. Try 100 to 150 pounds per acre on your orchard, field crops, vegetables or pastures, and watch the result

Arcadian Sulphate of Ammonia

ARCADIAN Sulphate of Ammonia is the well-known standard article that has done you good service in your mixed fertilizers for years past. Especially kiln-dried and ground to make it fine and dry. Ammonia 25¼ per cent. Made in U. S. A.

Always *more* miles on Ajax tires

MORE and more the farmer turns to Ajax as the tires to save him miles and money.
"More miles!" is every Ajax user's verdict.

AJAX ROAD KING

Ajax Road King yields more mileage because more mileage is built into it. The special Ajax feature—Ajax Shoulders of Strength—braces and reinforces the tread. See the picture of the Ajax Road King. Note how the Shoulders of Strength put more tread on the road—how they give more strength where strength is needed.

Dirt Track Champion

Ajax tires have won the dirt track championship of America for two successive years. In 1918 at county fairs, etc., all over the United States, they smashed 9 world's records and shattered 49 track records.

Tires which are best for dirt track racing are best for you, for dirt tracks are merely country roads fenced in.

Ajax tires will win for you. Try them.

Plowsole

A RECENT number of the Journal of Agricultural Research, Washington, D. C., contained a scientific discussion of "Relation of Inorganic Soil Colloids to Plowsole in Citrus Groves in Southern California by Charles A. Jensen of the United States bureau of plant industry and located at the Riverside Experiment Station.

We quote the summary:

A hard soil layer, here termed "plowsole," usually forms immediately under the soil mulch in cultivated citrus groves in Southern California. It often seriously limits the root system of the shallow rooted citrus trees and seriously interferes with penetration of irrigation water. After being broken up with a subsoiler it reforms when cultivation is resumed.

It does not form in mulched basins, nor seriously in groves surface mulched with organic matter and seldom cultivated.

Mechanical packing is not necessary for its formation, and it forms in all soil types examined in the area studied.

No greater accumulation of water soluble iron, calcium, magnesium, or silica was found in the plowsole than in the soil mulch or subsoil.

No greater acumulation of total ammonia soluble silica, iron, aluminium, or phosphoric acid was found in the plowsole than in the soil mulch or subsoil, after the calcium had been removed with hydrochloric acid.

The humus extract of plowsole contained more colloidal silica, iron, and aluminium than either the soil mulch or subsoil, but no more colloidal phosphoric acid.

Both the organic and inorganic colloidal material in the humus extract moved toward the positive pole in an electric current.

A conventional method for the determination of inorganic "colloid suspension" is given.

Plowsole contained a markedly higher percentage of inorganic colloid suspension than the soil mulch, and usually a higher percentage than the subsoil.

When soils were placed in pots in the laboratory, irrigated, and allowed to dry, the percentage of colloid suspension was found to be appreciably greater in the surface soil layer than in the subsurface layer, indicating that the colloids moved with the capillary soil moisture.

No relation could be observed between the percentage of inorganic colloid suspension and the percentage of organic carbon or humus in the soil.

Native uncultivated soils contained appreciably less colloid suspension than did similar soils which had been under cultivation for a number of years.

The decomposition of one per cent organic matter in soil had no marked effect on the percentage of inorganic colloid suspension; three per cent organic matter in some cases decreased the per cent of colloids. Barley decreased the amount of colloid suspension more than did alfalfa or manure.

The addition of ground lime rock appreciably decreased the percentage of inorganic colloid suspension in the soil when no organic matter was added. When organic matter was added, the flocculating effect of lime was appreciably diminished, especially in clay loam soil.

The addition of powdered sulphur and gypsum to soil markedly decreased the colloid content, and organic matter had no appreciable effect in counteracting the flocculating effect of these substances.

The addition of sodium nitrate to soil markedly increased the colloid content, and the addition of organic matter appreciably decreased the deflocculating effect of this compound.

The addition of lime, sulphur, sodium nitrate, iron sulphate, ammonium sulphate and organic matter to soils did not fundamentally change the composition of the inorganic colloid suspension obtained from the soil.

The addition of gypsum to soil increased the percentage of silica, calcium and manganese, and decreased the percentage of iron in the colloid suspension.

The inorganic colloid suspension contained an appreciably higher percentage of iron, aluminium, and manganese than the untreated soil.

In soils which readily form plowsole the percentage of silica in the colloid suspension was also appreciably higher than in the untreated soil.

The percentage of iron and aluminum in colloid suspensions from soils which readily form hard plowsole was higher than in colloid suspensions from soils which do not form a hard plowsole.

The percentage of iron and aluminum in the colloid suspension from a soil was found to be directly correlated with the readiness with which the soil formed plowsole.

Making Over to Secure Greater Profit

One of the trees in an Orange County orchard which is being made over into a more profitable bearing strain. Buds were inserted in these large branches and when it was sure they had "stuck" a portion of the top was cut out to allow young buds to grow and make a new top. The low hanging old branches were permitted to remain and take part of the sap and also to yield a partial crop before being entirely removed. Note the corn stalks which were placed around the buds for protection during cold SUBSOIL.

KADOTA FIG

W. Sam Clark of the Kadota Fig Orchard and Nursery at Sultana writes regarding "Farm Questions Answered," published by the Cultivator: "I am immensely pleased with the splendid book." However, he has a bit of criticism as to description of the Kadota, or rather a comparison of the Kadota and Endich, which appears on Page 56. Mr. Clark writes:

"I have looked the book over and can appreciate its true worth to all California farmers and growers, especially beginners. In reading over the fig section I see your informant, whoever he was, was in error regarding the identity of the Kadota. He says the Endich and the Kadota are one and the same. As well say that you and I being white men are one and the same family. He further says the Kadota growing near Los Angeles is larger than the same fig grown in the San Joaquin Valley, and larger than the Endich. It is always larger than the Endich, and my figs here are from two and one-half to

three and one-half inches in diameter, and I will buy your whole staff a new hat apiece if you will ever find an Endich anywhere as large as that. A Kadota grows a bigger tree sooner, produces double the tonnage of the average Endich, is always sweeter and makes a better dried article. Even Prof. Condit will tell you that the two figs are not identical, and Prof. Rixford is now an ardent admirer of the Kadota, yet he has seen the Endich all his life."

DISTRIBUTING GOPHER POISON

Horticultural Commissioner Bremner of Sonoma County has instituted a novel way of distributing the essential poison materials, strychnin and saccharin, for poisoning gophers. Directions say: "From a pepperbox sift slowly one-eighth ounce of powdered strychnin alkaloid, and one-tenth this quantity of saccharin, over four quarts of dampened baits, etc." Weighing these small amounts by the farmers was impossible, as none possesses sufficiently delicate scales, so Mr. Bremner weighs it out for them in small pepper cans with sifter tops. This amount is sufficient for preparing four quarts of bait, the needs of the average farmer, is convenient, handy and sells for a few cents. Commissioner Bremner considers that this method has greatly assisted him in the intensive gopher campaign he is carrying on in his county at the present time. A supply of this material is always carried along and sold to the farmers at the demonstrations.

BEE INDUSTRY IN ARIZONA

While Arizona is a large consumer of honey, in good seasons we ship out about 35 carloads, bringing a handsome income to our state. While the busy bee pays its keeper well for his care it is probably of more benefit to the farmer and fruit grower, especially the alfalfa seed raiser, for the bee it is that carries the pollen from bloom to bloom, fertilizing the alfalfa that has made our Arizona valleys famous for their yields of alfalfa seed.

Cochise County has 50 beekeepers with 295 colonies; Greenlee, 5 beekeepers with 250 colonies; Graham, 34 with 2486 colonies; Maricopa, 217 with 21,389 colonies; Pima 5 with 557 colonies; Pinal, 10 with 1569 colonies; Navajo, 13 with 1176 colonies; Yuma, 25 with 4398 colonies, making a total of 359 beekeepers in the state with 34,700 colonies.—B. A. Hadsell, Buckeye, Arizona.

FUMIGATION

Continued from Page 507

The question naturally arises, in view of the difference in distribution between gas from liquid hydrocyanic acid and the other methods of generation, as to any advantage or disadvantage therefrom in the use of this recent introduction. The infestation of scale insects on large citrus fruit trees is usually most severe on the lower or most protected part of the tree; especially is this true of the purple scale. The greater killing effect of liquid hydrocyanic acid at that part of the tree most severely infested with scale is the ideal to be sought, and at once brings this gas into favor over the field generated product for citrus tree fumigation.

There are other advantages favoring liquid hydrocyanic acid, which in themselves indicate that this new method will displace all others. The expenses of an outfit are reduced by doing away with cumbersome apparatus such as pots, generating machines, sulphuric acid drums and boxes of cyanid. The cost of tent mending is almost entirely done away with as liquid hydrocyanic acid is harmless to cloth. The treatment of small trees, frequently with such poor results in the past, can be performed with greater accuracy and corresponding certainty of results. Greater speed in tree treatment can be attained than previously and it appears possible that the quantity of hydrocyanic acid required for scale-kill can be slightly reduced over that formerly required.

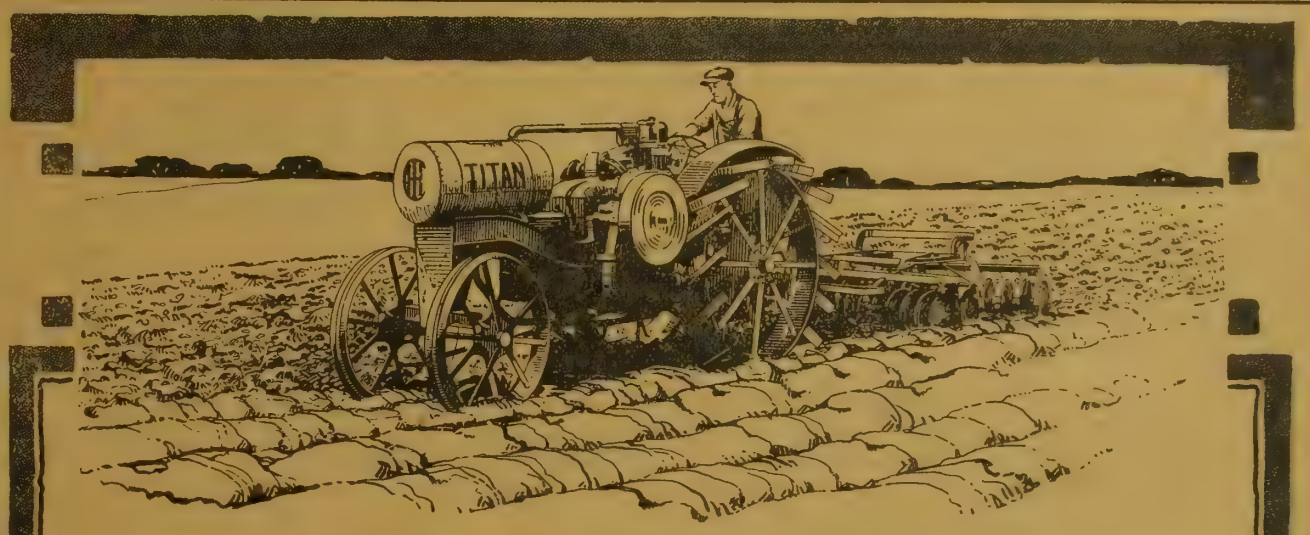
However, improvement in manufacture so as to furnish a uniformly high grade product free of impurities that might start decomposition, improvements in containers through the use of a material free from chemical action with the gas, and improvement in the field application to guarantee accurate delivery and complete gasification of the required charge are necessary before this gas is placed on the high plane demanded for orchard fumigation in California. Assurance has been given that these faults will be corrected in the immediate future, in which case by the end of another year the hundred outfits using this gas are certain to be greatly augmented for time to come, or at least until some scientist discovers a method of scale control its superior.

GRAFTING WAX

County Horticultural Commissioner G. R. Gorton of San Diego advises that growers in his jurisdiction are using the following formula in making a grafting wax, intended to be applied cold: Resin, one pound; turpentine, one ounce; alcohol (denatured), eight ounces; linseed oil, one ounce. (Melt resin and add turpentine and alcohol). The foregoing is an old French formula and no doubt is known to some of the commissioners.

Commenting on this, Commissioner Gorton says: "The appearance of it on the trees was very good indeed, as it made a perfect protection for grafts, upon which it had been used, and seemed to stand up well after application."

Why *Deming* Power Sprayers?



1. Every part is independent and accessible.
2. Strongest solutions do not score cylinders, plungers, valves or seats.
3. Outside-packed plungers avoid frequent delays.
4. Non-corroding pressure control.
5. Belt and idler eliminate destructive vibration.
6. Steel plate base for strength and perfect alignment.
7. Thorough agitation.
8. A complete selection of Deming sprayers, spray-guns, nozzles and accessories in stock at Los Angeles ready for immediate delivery.

The Tractor to Buy

ARE you one of the many farmers who need more power to handle the farm work properly? Do you have to work with less help than you need?

If so, you need an International kerosene tractor. The size that gives you power for your heaviest load will handle all the work. Internationals use only as much fuel as the load requires. They are made to work with farm machines—the kind you are now using—and special hitches are provided for all kinds of field and road work. Their belt pulleys are large enough to prevent slippage, run at correct speed, and are set high enough to keep the belt off the ground. They all use kerosene or other low-grade fuels which means a big saving in operating expense.

The Company to Buy From

You know that we have supplied farmers with high-grade machines for nearly 88 years. You know that our tractors have furnished satisfactory farm power for more than 12 years. We have far too much at stake to market machines of any but the highest standards of quality. We expect to come back some day and sell you some other machines in the long list you see in this advertisement. In every sale we try to build for the future.

Tractor Service Whenever Needed

In line with this policy, we have developed a service organization which now consists of 89 branch houses and many thousands of loyal local dealers, wide awake and attentive to the needs of their customers. Service is a very essential part of any tractor sale. When you buy an International kerosene tractor you buy with it the assistance of an organization that brings a well stocked branch house or a live, local dealer within telephone call, fully equipped to keep your tractor working steadily.

International Tractor Sizes

International tractors, all using kerosene for fuel, are made in 8-16, 10-20, and 15-30 H. P. sizes. A line to the address below will bring you full information about all our tractors and about any other machines you mention in the list shown in this advertisement.

LOVE OF GARDENS

By Ernest Braunton

IF you are to get the fullest pleasure from your garden you must center your affections upon it. Make your garden beautiful and you will learn to love it. Have quality, not in the individual plant but in the garden as a whole, even in general effect. You do not need broad acres and great masses of bloom to have an attractive garden. Even a large window box may be a fairly complete garden.

Some very tidy gardens are a rare combination of flowers and vegetables, for one may take as much pride in growing a cauliflower as any other kind of a flower. There is charm in having fresh vegetables right from the garden of the raised-'em-myself sort. You should be able to grow better fruits and vegetables than you can buy and more satisfactory flowers, even if not of large size, for you may grow those that most please yourself. One really should grow those things, in both vegetables and flowers, that he cannot otherwise easily obtain. Whatever you grow get close to the garden, be intimate with it, for the home garden is for the affections. Do not consider it as something apart, but a part of your daily life. Look to it for change and relief from other duties, even as you so regard a good book. Then will you learn to love your garden and find labor therein the greatest of human pleasures.

The Garden Spirit

Dr. L. H. Bailey says: "Simple desires with every desire well planned and well carried out, result in the best gardens. The garden must be yours; if it is another's it is not worth the while to you. A good garden is the one that gives its owner the most pleasure; he may grow orchids or thistles. The measure of success in the garden is the sensitive mind rather than the plants."

How Vines Climb

Some vines are twiners, without tendrils or other means of clinging. The hop and the moonseed are examples. Some climb by little round suckers or discs, the well known Japanese ivy or ampelopsis is one. The the English ivy climbs by aerial roots and so do some of the trumpet vines and Ficus repens, but one trumpet vine, Bignonia Tweediana, climbs by little three-fingered claws. Clematis and other vines are supported by twining the leaf-stems about everything in reach, and still others, as roses, have to be tied to supports.

Standard of Avocados

Poor avocados there are none; except they are unripe. One who has eaten them in Mexico, South America, West Indies, Hawaii, Philippine Islands, India and other countries spent a day with the writer visiting various trees and groves and sampling rich fruits. This judge, a naval officer, said those in California were as devoid of fiber or strong taste as any he had tasted. He stated that in the tropics some were fibrous or stringy and others had an unpleasant taste weakly suggestive of coal oil. He found none of that class here. During the past week the writer has eaten one each of Blakeman, Spinks, Colorado, Linda, and Collins and could detect no difference in value though slight difference in flavor. Of these Linda is the largest and Collins the smallest.

Perennial Plants

In California, where all the year is spring, summer, and autumn, without winter, we must look to permanent effect throughout the year. Therefore must we grow perennials. There is no class of plants requiring less care. Annuals are of transient glory and involve much labor unless the seeds are sown broadcast. To set out individual plants is burdensome. But good old perennials, hardy, tough, and thriving in all soils and under all conditions, yielding flowers even in the midst of abuse and neglect, these are what all should grow. For after all no class of plants is more responsive to good care.

Many Americans do not eat enough greens and salad vegetables for their health.

FARM PICNIC

Plans are progressing rapidly at the University Farm at Davis for the Eleventh Annual Picnic day which will be held April 26 this year. Preparations are being made for 25,000 visitors, as everything points toward this picnic being the finest event of its kind ever staged. The refreshment committee announces that it will serve free coffee to all visitors who have cups with them in their picnic baskets. Many people last year forgot to bring any containers, so missed this opportunity. The entertainment committee has gotten up entry blanks for the athletic contests and these are now in the hands of various high schools and athletic organizations. The chairman of the parade this year announces some surprises and changes in the style of parade and more comedy will be furnished. Many tractors will be in the line of march. The reception committee has assigned students who will meet all machines as they enter the grounds and show them over the wonderful 1000-acre farm. Last year 3500 autos passed through the arch and brought a good part of the 18,000 visitors.

Picnic day is being looked forward to more and more each year by those who have attended before and know what a pleasure it is to be able to visit their state institution and see for themselves the wonderful strides being made in agriculture through the use of modern machinery and scientific methods. Another fact which appeals to many is its non-commercial atmosphere and the spirit of wholesome fun which prevails. The publicity committee announces as its slogan, "You furnish the lunch—we furnish the fun."

HARD WORK

Continued from Page 505

gen, Boy's Club Leader C. W. Rubel, and W. A. Lloyd, extension director for the United States Department of Agriculture for the Northwest, were also with the party. With these and the advisers the delegates from various county bureaus numbered 150.

Intensely practical method of gathering and disseminating information! The object of those entering into the conference was to gather the information that they might on their arrival home inform their members and neighbors of the lessons of such an institute conducted in the orchards and on the farms of the state. But, in addition, the farmers in each district visited attended both field demonstrations and the evening gatherings. Such a trip calls for some expense and more endurance. Especially was this the case with the conveyances, for the trouble shooter which followed the 47 machines which made the entire trip had occasion to offer its service to all excepting four.

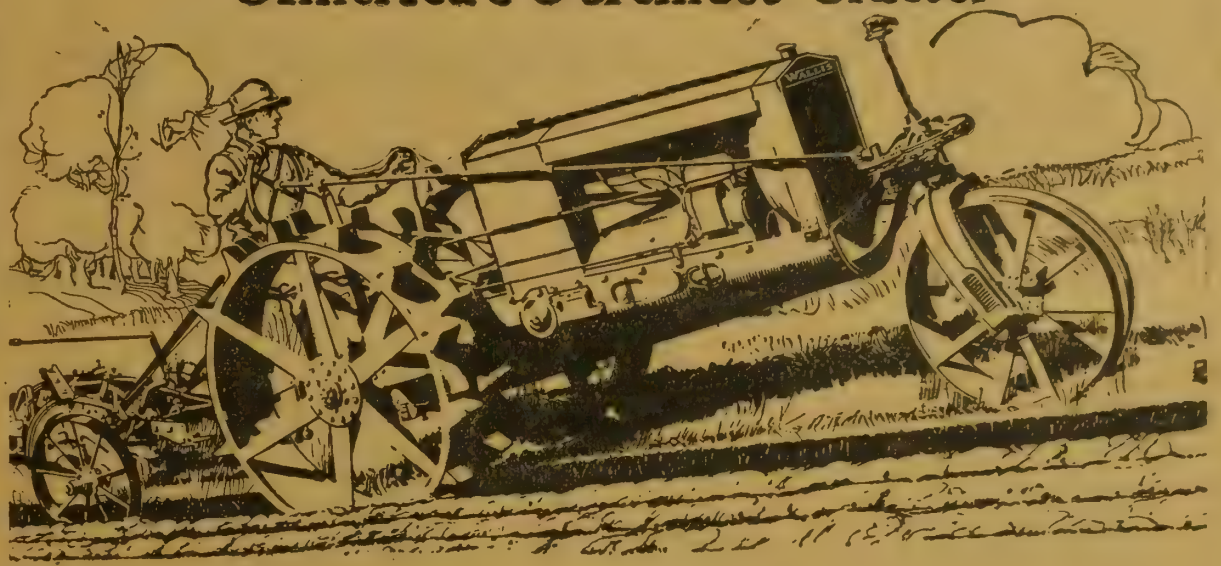
Queries

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Sweet Corn Fodder

Would there be any food value for cows and horses in sweet corn fodder, cut up in ensilage cutter immediately after removing roasting ears? Would same keep in bins about ten feet square and six feet deep under roof? Should it be salted or otherwise treated or cured before cutting up and putting away?—Subscriber.

Yes, this fresh cut green stuff would make exceptionally fine feed for dairy cows and in limited quantities could be added to the ration of horses. It would be much richer in protein than the fodder from ripened corn, likewise it would be more acceptable to the cows. As to keeping in bins, do not think this would be successful unless they were made somewhat like a silo, air tight. Of course such silage would have lower value than the ordinary silage in which the full grain is cut up with the stalk. If treated as silage the salt would not be necessary, and in the large bins where the air would have access to it, we do not think it would keep even with salt added. The cutting of a few days' ration would, however, be entirely practicable.



Bacteria for Beans

Will you please tell me what is the proper bacteria with which to inoculate Whip-poor-will cow peas before planting them as cover crop? Also manner of using?—Subscriber, Anaheim.

We believe the same bacteria used with any of the bean family will answer with the cow pea, which is more correctly a bean. The particulars as to using may be had upon the package in which the culture is secured. In a word, however, the culture is added to water which is sprinkled over the beans as they are shoveled over. The cost is about $2 per acre.

WALLIS

America's Foremost Tractor

WALLIS first combined great power, lightweight and durability in a tractor.

The Wallis "U" frame is an advanced idea—the strongest, yet lightest construction known to mechanics. The Wallis weighs 1,000 to 5,000 pounds less than tractors of equal drawbar power.

Wallis was first to enclose all gears, including the final drive. In the Wallis all materials are the finest—workmanship the best—motor as perfectly finished as that of an aeroplane or the highest grade automobile. At the National Tractor Demonstration, farmers marveled at how the Wallis motor was always cool.

The Wallis gives the greatest return for the money because it does the most work on the least fuel; with the fewest delays; and at lowest up-keep cost.

Why the Wallis is America's foremost tractor is explained in the latest Wallis catalog. A copy will be mailed on request.

Whitewash for Barn

Please give good receipt for barn whitewash.—Subscriber, Durham.

For exterior of buildings here is a formula recommended in our issue of June 22, 1918:

1. Sixty-two pounds (one bushel) quicklime, slake with 12 gallons of hot water.
2. Two pounds common table salt, one pound sulphate of zinc, dissolved in two gallons of boiling water.
3. Two gallons skimmed milk.

Pour 2 into 1, then add the milk 3 and mix thoroughly.

Incubating Goose and Duck Eggs

Please give me particularse of hatching goose and duck eggs by incubator. Can I hatch them together? —J. L. C., Anaheim.

Both duck and goose eggs require a little lower temperature than hens' eggs during incubation. For duck eggs keep the incubator at 102 degrees the first three weeks and 103 degrees for the last week. The temperature may go above 103 degrees and sometimes will go as high as 104 degrees at hatching time. Operate the machine according to the manufacturer's directions. It is usually advisable to supply misture for duck eggs during the last week or ten days of incubation. This may be done by sprinkling the eggs with water heated to about 100 degrees, by placing a pan of water, a tray of moist sand or a wet sponge below the egg tray, or by sprinkling the floor of the incubator room. The eggs are usually turned twice daily after the second and through the twenty-sixth day and cooled once daily after the seventh and through the twenty-sixth day. After turning the eggs reverse the trays end for end and from one side to the other in two-tray incubators. When the ducklings are all hatched remove the egg tray and open ventilators according to manufacturer's directions, but keep the ducklings in the incubator from 24 to 36 hours after the hatch is over. It is important that duck eggs be tested the seventh day, or earlier, and again the fourteenth day, as germs decompose very rapidly.

For goose eggs incubators are run at a temperature of 101.5 to 102.5 degrees, and the eggs are sprinkled daily with warm water after the first week. As duck eggs, except the Muscovy, hatch in 28 days, while goose eggs require from 28 to 30 days, it would hardly do to put both in the same incubator. The duck eggs would hatch earlier and the goose eggs that had not hatched when the duck hatch was over would be lost. In addition to this objection, there is the question of temperature. An amount of heat that would be all right for duck eggs might kill the germ in the goose egg.

Chinese Photinia

Please tell me name of tree of which I enclose leaves and flowers.—F. D., Sanger.

This tree is Photinia serrulata, native of China. It is very closely related to our native Christmas berry or "Toyon", which is really P. arbutifolia, though it goes by the botannical name Heteromeles, This Chinese tree is hardy in all parts of California, of easy growth and a fine ornamental.—E. B.

Treatment for Alkali Soil

You can make $180 a week with fruit and vegetable apparatus. Write at once. Cal. Dried Produce Co. New way fruit and vegetable drier. 20 Eighth Street, San Francisco, California.

In spite of scarcity of implemen and shortage of farm labor, Englan Scotland and Wales have all increa ed their acreage of wheat.

form of sulphur in with the seed (in the same furrow with the seed) that they will assist directly or indirectly in helping the plant overcome the ill effects of the alkali. Can you give me authentic information in regard to this? What form of sulphur is it they use?—Subscriber, Fullerton.

We do not think the use of sulphur in such quantities as would be possible under reasonable cost would affect materially the alkaline condition. However, gypsum is beneficial in this that it would change the black alkali to a white alkali which is less caustic and in addition is more readily leached from the soil by rains and heavy irrigation. Heavy application of coarse manure is also beneficial, but the most satisfactory of all treatment of alkaline soil is underdrainage. We would not consider the application of commercial fertilizer an aid in control of alkali sufficient to cover cost.

Planting Small Fruits

How far apart should rows and plants in row be with loganberry, dewberry, thornless blackberry, and what is best method of trellising each variety? I wish to set so as to secure greatest profit from the fruit which is to be sold on the market.—Subscriber, Newman.

All above rows should be five feet apart. Plants four to six feet apart in the row. Loganberry and thornless blackberry should be trained on wires stretched about five feet above the ground while dewberries do better on wires stretched about three feet above the ground. Wires stretched by placing strong posts at each end of the row with cross bar about two feet long running wire from each end of bar and two in between. The posts are set along the row at intervals to support the wire and plants.—De F. R.

Cost of Line Fence

My neighbor wants a fence between our places. Can he make me pay for half of it? I do not feel able now to pay for half the cost of fencing and I do not need my place fenced now.—Subscriber, Kingsburg.

If you have live stock running on your property which would be controlled by a line fence then the neighbor may insist on your joining in its cost. If your stock is not at liberty in your own field then the cost of the fence should be borne entirely by the neighbor. That is, this is according to the present state law. Should you later, however, proceed to use your property as a field for pasturing or keeping stock, then the neighbor may ask and secure one-half the cost of the line fence.

Satsuma Orange

I wish to set a commercial orchard to the Satsuma Oonshiu orange. What is the best budding stock for this orange?—Subscriber, Oroville.

This question was referred to R. M. Teague of the San Dimas Nurseries and he writes:

"The writer does not feel qualified to advise as to which would be preferable in this case. The sour stock grows a much larger tree and also produces larger fruit. However, we are under the impression that the Trifoliata root would ripen the fruit at least one month earlier and it might possibly be of a better quality, although not so large in size as if budded on sour stock. In as much as these are dwarf or semi-dwarf trees they would stand planting together much closer than the average stock. C. C. Chapman of Fullerton is planting some budded on Florida sour stock, but as we have never gone into the matter of the quality produced on these two stocks, we would not be in a position to pass on a situation of this kind. Perhaps the citrus experiment station at Riverside could give you more definite information, as we supplied it different plots of stock budded on the five different root stocks, viz., sweet orange, sour orange, rough lemon pomelo and Citrus Trifoliata."

Cherries Not Bearing

Why is it that a cherry tree which blossoms heavily fails to set any fruit?— Subscriber, Lodi.

Perhaps it is because of the section which may not have the right conditions for producing cherries. Again it may be the variety of tree. It is barely possible that it is because of lack of pollination. If the latter is the case, then planting another tree which blossoms at the same period would possibly correct the evil. However, our guess is that one of the first two reasons given is the more correct.

Pruning Almonds

How should almonds planted two years be trimmed? Some are good size, others slender. Should the slender ones be cut down within a foot of the ground and forced to run up a single straight shoot?—Subscriber, Newman.

It is now rather late for pruning almond trees and we do not fully understand the situation. If these trees have been planted two years and still have only slender shoots they are not very thrifty or strong growing and a new tree would perhaps be best. In planting, if they could have been topped down to say 16 or 18 inches and made to send out lateral shoots, say three or four good thrifty growing branches, this could have been made the foundation of the trees which another year could have been cut back to two or three good buds on the spurs. Do not allow orchard trees to run up to long whip like trunk.

Ownership of Manure

I sold my dairy of five cows to a tenant who keeps them on my walnut orchard. He is selling the manure off the place and even demands that I pay for what I need. What are my rights in this case?—Subscriber, Santa Ana.

Unless agreement provides otherwise, we think the tenant can control every product of the place, and manure is one of these products. However, we believe there is a technical point that if the manure is hauled from the stable and placed in piles or distributed then it becomes a part of the realty and may not be removed without consent of owner of the land.

Silver and gold don't rhyme, but they make a pleasant jingle.

THE NEW

Studebaker

CARS

THE New Studebaker Cars—notable for their thorough quality, for their comfort, their economy, and their beautiful lines—are the supreme product of Studebaker's 67 years of manufacturing experience.

You have known Studebaker Cars for years—you know how they have proven good under all the varying conditions of service on country roads. Your father—yes, and your grandfather—knew, too, the inbuilt quality and proven excellence of Studebaker vehicles.

Never has Studebaker quality and honest value been more self-evident than in the New Studebaker Cars. The long years of experience, the feeling of responsibility to buyers, the pride in that name Studebaker, show in every detail of design and manufacture.

The New Studebaker Cars, in three distinct sizes, represent the best that engineers know. They embody so many splendid features of construction that you must see them to really appreciate their mechanical excellence.

Division of Property

Six children have come into possession of 400 acres of land by deed upon the death of their parents. All of the children are of age. Some of the land is better than the rest and there is a good house and barn. Now, can one or two of the children force a sale, or do the majority rule, as it is a hard matter to divide the land?—Subscriber.

Any one of the children may bring an action for partition of the property. This is a very flexible action and is calculated to take care of the interests of the parties as may seem best to the court in each instance, as for instance, a partial partition may be had, some may agree to pay off the one or two insisting upon their share, or whatever other way which may be found best and most agreeable.

Tax on Insurance

Is an insurance policy payable to an estate for $2000 subject to any tax?—Subscriber, Garden Grove.

As stated it would be subject only to an inheritance tax in case the person to whom it was to be distributed was the uncle, aunt, father, mother or descendant of such, in which event there would be $1000 exempt and a four per cent tax upon the other thousand; in the case of any more distant relatives or persons strangers to the blood of the deceased there would be $500 exempt and a tax of five per cent upon the remainder. Of course, the policy as a part of other property of the estate would bear its rate of inheritance taxation.

Contract Not Completed

A contracted with B to level a certain piece of land by the 15th day of May, 1919, for the total sum of $300 to be paid on completion. The contract was verbal and there were no witnesses. B has entered upon the work, put on very inefficient help and been very dilatory, but has finished about two-thirds of the work. B now states that he took the contract too cheap and if A will not give him more money he will quit; A refused to do this and B has quit. What are the rights of the parties? Does B have to finish the job to collect? Can A hire the job finished and charge to B's account?—Subscriber, Bakersfield.

The job being an entire one and the mere fact of an erroneous calculation of the amount necessary to give a profit not being sufficient to warrant B in repudiating his contract he must finish in order to collect. He having repudiated the contract and refused to finish, the option of three moves is in the hands of A; he may treat the contract as ended; he may immediately bring action for the breach as for any damages he may suffer through the repudiation of B; or he may complete the work and then bring action for any over-plus he has been required to pay for its completion, paying B the remainder of the $300. In order to prepare for any future trouble, the writer would suggest that A with two witnesses call upon B, state what the terms of the verbal contract were and have such terms assented to by B, either by words or through silence, recite the fact of the repudiation by B and the reason given, and demand that B forthwith proceed to complete the contract or stand responsible under one of the foregoing options which A is entitled to choose. Then having the evidence better prepared A can safely proceed to have his work done.

Liability for Water Run-Off

What is the liability of a rancher for the run-off of storm water in winter? What is his liability for the run-off of irrigation waste water in summer onto a neighbor's land?—Subscriber, Glendale.

The true measure of compensation for seepage or waste of irrigation water or storm water, in case of liability for the last named, is the value of the crops of your neighbor destroyed, although evidence of the adaptability of the land for crop may be considered. A land owner who permits water used in irrigating his fields to escape on his neighbor's land is liable for the damages caused and may be restrained from continuing the injury. As to storm water he is not responsible merely for the flow of water from his land to that of his neighbor, unless he has in some way changed the course, or by artificial means of gathering the water in ditches increased the damage which would be caused thereby; for the natural fall and run-off he is not responsible.

Road Right-of-Way

There is an old road laid out over 40 years ago, travelled over all that time with no objection; now a neighbor, who is an absentee owner, wishes to close the road, claiming it runs over his property. This will leave us with no way between our property and town . Shall we take this up with the supervisors, district attorney, or with whom?—Subscriber, Encinitas.

Although the history of the road is not sufficiently full to base a positive opinion upon, it would very strongly appear that you and your neighbors have a prescriptive right to the road. The best mode for you to employ would be to take the matter up with the supervisor for your district in his capacity as road commissioner; it is his duty to take the proper measures to provide you with either an enforcement of your rights in the present road or make other provision.

Community Property

What is community property and what is separate property?—Subscriber, M. T.

The separate property of either husband or wife is all that property owned prior to marriage and that acquired afterwards by gift, bequest, devise, or descent with rents, issues, and profits thereof. This includes both real and personal property. All other property acquired after marriage by either husband or wife, or both, is community property, except that the earnings and accumulations of the wife and of her minor children living with her, while she is living separate from her husband is likewise her separate property. It matters not that the original separate property may have been sold, the receipts of such sale are separate property and any subsequent re-investment is separate property. The wife may, without the consent of her husband, convey her separate property; she may even enter into contract with her husband in respect to her separate property.

Property Disposal

A man marries, has children, is divorced, at which time he leaves all his property to that family. He subsequently marries again and accumulates other property, real and personal. There are no children by the second marriage. On his death, without will, to whom does the second accumulation of property go? If a will was made wholly in favor of the second wife could the children of the first wife break it?—Subscriber, Galt.

These accumulations would be the community property of the second marriage of which the second wife is entitled to one-half with or without will. The other one-half is absolutely subject to the testamentary disposition of the husband; if he desired to cut off the children by the first wife by will he can do so, being careful in such will to mention them and state that such is his desire. In case of his decease without will the second wife would doubtless be entitled to one-third of the one-half which is subject to disposition and the children by the first marriage would be entitled to the remaining two-thirds of the said one-half divided share and share alike.

FRED K. HOWARD RESIGNS

County Horticultural Commissioner Fred K. Howard of Kings County has resigned in order to engage in commercial work. An examination was held April 11 at Hanford to establish a list of eligibles to fill the vacancy.

Veterinary

Answers in this column by Dr. Wm. Petrie, 2714 South Harvard Boulevard, Los Angeles, are without charge. For immediate mail answer remit $1.00. In writing questions give full symptoms or particulars of injury of animal.

Unsigned communications receive no attention.

Calf Ailing

Can you tell me what is the matter with a three months old calf that chews its cud and in so doing spits out half digested matter of very offensive odor? The calf is fed alfalfa hay in addition to its milk ration. Other calves fed in the same manner as this one are correct in their digestion. What is the cause and what is the remedy?—Subscriber, Hemet.

Am inclined to think there is something wrong with the calf's teeth. Examine the mouth carefully. You may find a defective tooth or a thorn imbedded in the tongue or cheek. If you do not find anything wrong in the mouth then put a teaspoon of baking soda in the feed once a day for a week.

Labor Pains After Calving

We purchased a three year old Holstein heifer three weeks before she gave birth to a fine large bull calf. She seemed in normal condition except a swollen appearance in the rear with a small amount of discharge. After calving the discharge increased greatly and every three or four days she seemed to be in great pain trying to expel something. She was given douches of Creolin solution twice a day at first, then once a day and then every other day until the trouble disappeared, but after a rest of four days in the treatment the trouble returned. The discharge has the color and consistency of the white of an egg. What treatment would you advise?—Subscriber, Chalfant.

The swollen condition and slight discharge before calving was normal unless the swelling and discharge was very great. Such a discharge after calving is normal also but in fat or overfed animals it may be excessive. The pains you mention may be caused by some part of the uterus being misplaced. Such pains do occur when there seems to be no cause for it. You can only tell about the misplacement of part of the uterus by examination and then you must know the parts. Would suggest that she be kept in a stall for a week or more, that is low in front so when she stands her hind feet will be six or eight inches higher than the front feet. Also give her a teaspoon of the sulphate of iron in the feed once a day for a week to dry up the discharge. Also reduce the feed. The douches will probably do no good. Those troubles usually grow less and soon disappear.

Stringy Milk

Our cow is giving stringy or lumpy milk from two of her teats. She is about dry and will be fresh again about the first of April. The udder feels as though it was thick from some caked substance inside. The milk was extremely yellow for over two weeks before I started to dry her up. The milk did not flow readily without working the udder at the time of drawing the milk. The cow seems well otherwise. Will there be any ill effect from this when she is milking again?—Subscriber, Zelzah.

The quarters of the udder from which the stringy milk comes are congested. It may be caused by too rich feed. Feed her lightly until some time after she is fresh and see that she gets plenty of green feed to keep the bowels open. Rub the udder and continue to milk it out clean twice a day up to the time she is fresh again. Also get three pounds of epsom salts and two pounds of common salt. Mix them and give a large handful in her feed once a day until you have used it all. With careful handling you may get the udder back to its normal condition.

Show Me Facts!

BEFORE you buy *any* tractor you have every right to say to the manufacturer: "Show me what the USERS of your tractor have to say. *Show me* that it has already proved itself economical and practical in every-day work. *Show me* the *figures* your *users* have given you so that I may figure costs and so determine why I should own one of your tractors."

Here, then, is part of one of the large number of letters constantly received from farmers telling us what their *Cleveland Tractors* do for them.

To begin with, I used my Cleveland Tractor to plow about 305 acres during 1918 and used double discs, two 60 tooth harrows and a heavy wooden drag on one load for fitting.

When I plowed I covered from eight to ten acres a day with a two-bottom gang and covered about 40 acres a day with the harrows.

I harvested 150 acres of wheat and oats at 25 acres per day.

In July I used the Cleveland in loading hay, and got in the crop from 140 acres at the rate of about 35 tons a day.

Besides these things, I used my Cleveland for a great many belt jobs—put in 300 tons of ensilage in 32 hours, on 30 gallons of kerosene, for instance.

I now keep six horses, instead of the fourteen I had before and need two men less than previously.

My Cleveland is in excellent condition, ready for the 1919 season, and counting everything, I haven't spent over $10 for repairs.

F. H. JOHNSON,
New Augusta, Indiana.

Such specific, definite facts tell why the Cleveland is so fully justifying the faith that so many farmers have placed in this compact, powerful Tractor. Write *today* for complete information and the name of your nearest Cleveland dealer.

Big Money In Stump Land

H. G. Hunzicker, of Foster, Wash., pulling a 24-inch fir stump with deep tap roots out of hard ground.

This man made $35 Land Worth $200 an acre Pulling Big stumps by hand

CLEAR your stump land cheaply—no digging, no expense for teams or powder. Your own right arm on the lever of the "K" Stump Puller can rip out any stump that can be pulled with the best inch steel cable. I guarantee it. I refer you to U. S. Government officials. I give highest banking references.

Showing easy lever operation

HAND POWER
K Stump Puller

One man with a "K" can outpull 16 horses. Works by leverage—same principle as a jack. 100 lbs. pull on the lever gives a 48-ton pull on the stump. Made of best steel—guaranteed against breakage. Has two speeds—60 ft. per minute for hauling in cable or for small stumps—slow speed for heavy pulls. Works equally well on hillsides or marshes where horses cannot go.

Write me today for special offer and free booklet on Land Clearing.

Weight, without cable, 171 pounds

No Stump Too Big For The K

MUSCLES OF STEEL

You can begin plowing early with the LAUSON TRACTOR. Early in the season, early in the day. The LAUSON is a good servant. It has muscles of steel and iron. You do not have to bed it, feed it, nor scrape its collar pads. Its shoulders never get sore and it drinks but never eats. And it even stops drinking when it stops working.

With the LAUSON Tractor one man can handle three times as much work because the physical element never enters in.

The LAUSON 15-25
DUST PROOF—ALL GEARS ENCLOSED

is built so that mechanical perfection and ruggedness appear in every detail of construction. It will stand the hard gruelling work of power farming day in and day out without a rest. Sold with or without Christensen starter.

Known as the Pattern Tractor

It is dust proof; all the gears, including the final drive, being fully enclosed and running in a bath of oil.

It has reserve power, the Lauson-Beaver valve-in-head engine being capable of delivering fully 25% surplus of power. There are 24 sets of Hyatt and Timken roller and ball bearings to insure easy running and freedom from friction.

You owe it to yourself not to purchase a tractor until you have seen the Lauson. Taking into consideration its power and durability, it is the most economical farm power unit on the market today. Your nearest local dealer will be glad to demonstrate the Lauson on *your* farm. If you don't know him, we will be glad to send you his name and address.

Builders of Lauson Frost King Engines

For twenty-three years the LAUSON Frost King Engines have been the standard of farm engine excellence—1½ H. P. to 18 H. P.

The Wool Prospects

FRED A. ELLENWOOD, a practical wool grower and president of the California Wool Growers Association, in an address at the annual meeting gave a review of the situation and anticipated somewhat the coming year's possibilities:

"When our boys were leaving a year ago, thus creating a shortage of labor, we saw the cost of production increase until it was about doubled. Today, with the boys returning, we have noted but little reduction in production cost, yet wool and mutton, our finished products, have both decreased in value materially.

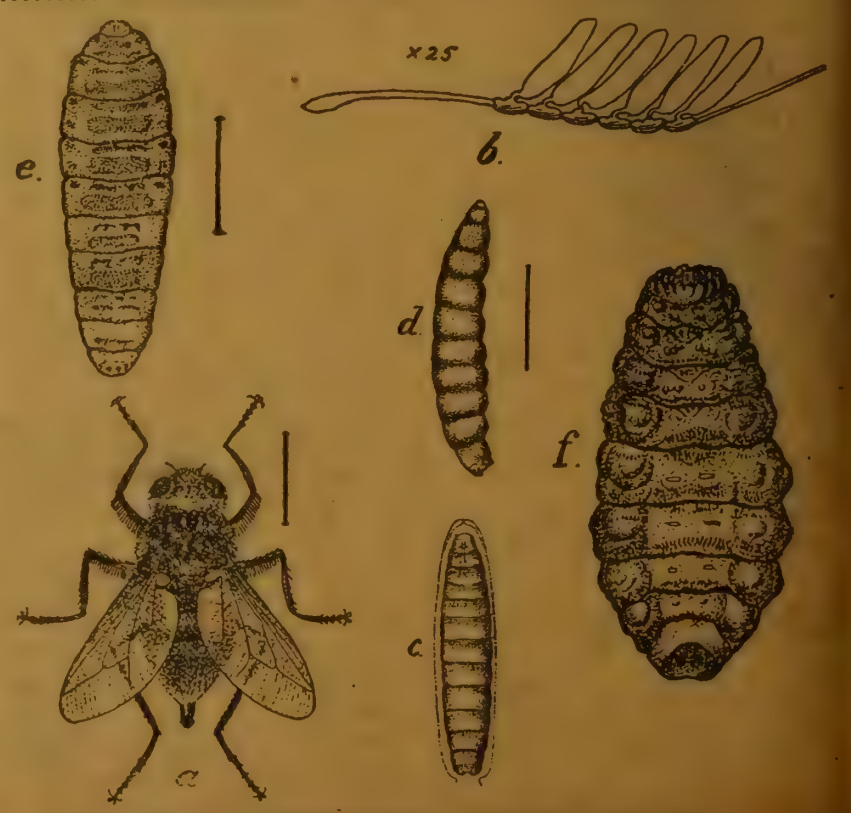
1911 Wool Market

This is anybody's guess at present. However, much depends upon the action taken by our own government in disposing of the great quantity of wool now owned by it. If our government refuses to sell this wool, without taking more than a ten per cent loss, our prices for the coming clip should be fair, although not equal to those of last year. Much also depends upon what England does with the Australian clip, as the Australian clip of 1919 belongs to the English government.

"If England does not permit much of this wool to enter the United States, that will help us materially, but none of us can tell what either the English government or our own government will do with the wool now owned by them. Our national secretary, S. W. McClure, is now in Washington, D. C., trying to combat the influence of the wool manufacturers. They are using all the skill possessed by a strong organization of the very smartest men in any branch of the wool business, trying to have wool prices reduced before our spring clip comes upon the market. The governor of Massachusetts, in which state so many woolen mills are located, has recently made a strong plea to our government officials for a reduction in the price of wool.

"Naturally wool manufacturers try to secure their raw material just as cheap as possible. As their raw material, wool, is our finished product, our financial interests are always conflicting. This 1919 wool clip has been produced at just about as high production cost as was ever known and our government should not permit last year's wool clip to go to the mills at a loss of more than ten per cent to the government.

"The only suggestion I have to offer concerning the wool market, at present, is for sheepmen not to contract their wool before it is sheared. If the market is not as we think it should be at that time, we can consign our wool and sell on the Boston market. We have had some experience the past year along that line and know we can do it if necessary. We should strive to have all the wool sold in this manner. Instead of wool dealers buying and speculating in wool, at our expense, they should simply be wool brokers, the same as live stock commission men are at the stock yards in Chicago, Omaha and other places.



"One other point we have gained for future reference by the government handling the wool clip as it did last year, is the fact that the basic principle in determining the grease value of wool is the shrinkage, and if the government can determine this accurately enough to fix a grease market price on our wool, then it can surely estimate it close enough to determine the amount of duty that should be paid by an importer on grease wool.

"Eight years ago when we were urging a scoured content wool tariff importers and manufacturers argued that it was absurd to expect the government to determine the shrinkage on grease wool for the purpose of collecting wool duties. Everyone knows it can be done by the government now. Today we have no wool tariff, and prior to the present administration for a number of years, we had one framed by the manufacturers and importers for their special benefit. No wool tariff has ever been fair to the wool growers. Let us spend the next two years talking for a scoured pound wool tariff, one that will be fair to both the producer and the consumer, as well as the manufacturer, but without putting a burden on the consumer for the special benefit of the manufacturer and importer. This can all be accomplished by assessing wool duties, whatever they may be, upon the scoured content."

Touching upon the wool situation the statement just issued by the office of information, United States department of agriculture, is in effect:

Nearly 50 per cent of all looms making wool goods in the United States were idle on February 1 this year compared to 38 per cent idle on January 1. Figures on other idle wool machinery as given by the bureau of markets, department of agriculture, were: Woolen cards, 39 per cent; combs, 40 per cent; woolen spindles, 41 per cent; and worsted spindles, 49 per cent.

The report shows few machines working on double shift, while the percentage engaged on government orders is greatly reduced, not being over 10 per cent in any machinery group. Of the machinery reported in operation from 4 to 14 per cent was running 40 hours or less each week.

How He Looks When He, or Rather She, Is Enlarged

The warble fly (Hypoderma lineatum): a, adult female; b, eggs attached to a hair, x 25; c, larva as seen in egg; d, larva from esophagus of an ox; e, next stage of larva from beneath the skin of the back; f, larva at the stage when it leaves the back of cattle and falls to the ground—all enlarged (after Riley).

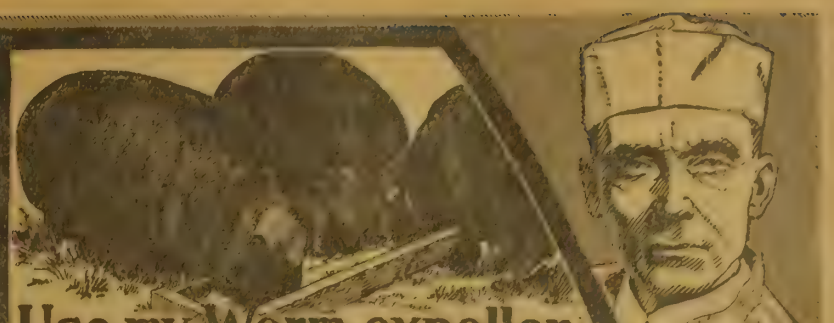
Concrete for Permanence

GRUBS, WARBLES, BOTS

THE common parasites known as grubs, warbles, bots, etc., found under the skin of the backs of cattle, where they form more or less conspicuous lumps during the latter part of winter and spring, are the larvae of a fly known as the heel fly or warble fly. This fly (Hypoderma lineatum) is about one-half inch long, very hairy, and somewhat resembles a small black bee. The flies appear early in the summer and are more or less prevalent until the beginning of cold weather. They deposit their eggs on the skin of cattle, fastening them to the hairs. The eggs are often deposited on the heels above the hoofs, hence the name "heel fly."

Although the flies are unable to bite, cattle seem to be much afraid of them, and often at their approach make violent efforts to escape, sometimes falling over precipices or becoming mired in water holes in the course of their headlong flight.



As a result of recent studies by various investigators it appears that the tiny grubs, newly hatched from the eggs, may gain entrance to the body by penetrating directly through the skin. Many observers, however, have held that the eggs or newly hatched larvae are taken into the mouth by the cattle licking themselves. It is possible, as in the case of several other parasites, that both modes of infection may occur and that the larvae may gain entrance to the body either by penetrating the skin or by being swallowed. From the evidence at present available it seems likely that the usual mode of entrance is through the skin. Irrespective of the mode of infection, the larvae evidently wander extensively through the tissues of the body, developmental stages being found in considerable numbers in the wall of the esophagus during the fall of the year. They have also been found in the spinal canal and in various other locations. Finally, about January they appear beneath the skin of the back, forming the well known swellings. The posterior end of the grub is near the small opening in the hide, through which the grub breathes and discharges its excrement, and through which, when its development is complete, it finally escapes. The anterior end of the grub is at the bottom of the tumor, where the mucus collects upon which it feeds. By spring or early summer the grub is full-grown and forces its way out of the skin, falling to the ground, into which it burrows for a short distance and transforms into the pupal stage. In about a month the mature fly emerges.

Grubs weaken cattle, cause them to fall off in flesh and milk and decrease the value of the hide. The beef in the immediate vicinity of a grub becomes slimy and of a greenish color, and is known to the butchers as "licked beef".

The total loss to the country on account of the warble fly is estimated at $35,000,000 to $50,000,000 a year, at the least, and may amount to considerably more.

Treatment for warbles.—During the winter and spring examine the cattle for the presence of warbles. By passing the hand over the backs of the animals the swellings marking the location of the grubs may be readily found. Pressure properly applied to the swellings will cause the grubs to "pop out" if they have reached a late stage of development. They may be more easily removed by means of slender forceps inserted into the opening of the warbles, and a still more certain method of removing them, particularly if the lumps are still very small, is to cut into the swellings with a sharp knife or bistoury, after which they may be pressed out. Care should be taken to crush all grubs removed, so as to prevent the possibility of their further development and transformation into flies. In order that none may escape it is advisable to examine the cattle every two weeks during the late winter and spring, at each examination removing the grubs which have developed sufficiently to cause perceptible swellings.

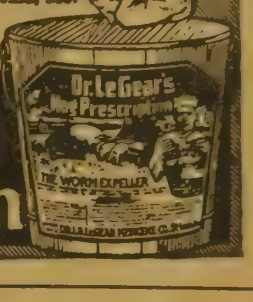
Another method of treatment is to force grease or oil into the openings of the warbles, which kills the grubs. This method is less certain than that of removing the grubs, and has the

Use my Worm-expeller-make more Hog-money

Worms are the worst cause of big hog loss. They cut down *your* profits, because practically all hogs have worms. I *know* this from my 26 years of veterinary practice. I also know that my Hog Prescription is a deadly enemy of worms—it *does the work*—rids hogs of worms, tones up the digestive organs and makes more hog-money for *you*.

It is the supreme remedy for nearly all hog ailments. A first-class tonic and blood purifier, fat producer and worm-expeller. Good for many cases of so-called cholera in hogs, such as diarrhea, bowel trouble, kidney worms, etc.

Don't tolerate wormy runts and costly feed loss—try my Hog Prescription



At my risk

Buy it today—if you don't find it does what I say, go to your dealer and get your money back. 60c packages; 25 lb. pails, $3.00; 100 lbs. $10.00. Retained After-birth

Cows can be made to clean easily without using force.

When cows do not clean properly after calving, it indicates a germ infection which is likely to run through the entire herd and result in Abortion and Barrenness.

The after-birth should be removed at once without force by means of the B-K douche and the cow treated to prevent her becoming an aborter or sterile. Authorities state that while there is no absolute cure for abortion and sterility, nevertheless the infection can be controlled by prompt treatment and the animal saved for successful breeding.

B-K is scientifically correct for this work. Used as a douche for the uterus, it quickly brings the after-birth, dissolves the slimy albuminous matter, kills the germs, stops discharges and controls the infection. B-K does not cause straining, but is soothing and heals the tissues.

Send for "evidenee" and free Bulletin No. 52 "Contagious Abortion." If your dealer does not have B-K send us his name.

further objection that the dead grubs remain beneath the skin.

Cattle may be treated during the summer with fly repellents to keep off warble flies. The efficacy of repellents against these flies is probably, however, not very great.

JERSEY BREEDERS MEETING AT DAVIS

The California Jersey Cattle Club met at the University Farm, Davis, March 19.

The purpose of the meeting was to discuss greater pnublicity for the breed in this state. All were agreed that the Jersey was being handicapped and that the breeders of California were hiding their light under a basket. There are many excellent herds in the hands of California breeders that have made enviable records both in the show ring and on performance tests. These breeders have demonstrated to their own satisfaction that the Jersey is a profitable cow but they have not gone about letting the dairy interests of the state or the prospective dairymen know what they are accomplishing. This they propose to do by a general advertising campaign, the details of which will be worked out by a committee consisting of J. E. Thorp, S. F. Williams and Professor E. C. Voorhies.

At the suggestion of the president, Dr. Hand, who declared that the fight now being waged on the milk producers associations had its origin among the "vested interests," meaning the privately owned central plants, who were leaving no stone unturned to discredit the association's motives and work, a resolution was unanimously passed in support of the work of the state market director and protesting any attempt to enact legislation that would strike at the root of cooperative work in this state.

A resolution was also passed urging that all Jersey breeders inaugurate a systematic campaign on bovine tuberculosis.

The club voted to donate a suitable trophy to be awarded in the students' live stock fitting contest which will close at the University Farm April 26, Picnic Day.

Chas. Adams, manager of the Hearst ranch, was voted a membership in the club.

A luncheon was served at noon and in the afternoon a live stock demonstration was staged for the benefit of the visitors and the farm advisors.

Mitchell Holsteins to Many New Buyers

One of the most satisfactory sales of Holsteins held in the state for some time, from the standpoint of the future welfare of the breed, was held by Walter F. Mitchell at his Packwood Farm, near Visalia, Thursday, April 3rd. The reason for such characterization of the Mitchell dispersion is due to the fact that few sales have served to distribute so satisfactory a class of cattle to as many new buyers. Few established breeders appear in the list of buyers—practically the entire offering being absorbed by new men. Such sales mean much for the advancement of the breed's interests.

The general average of the vendue was $325, but 28 cows, not many tested ones, averaged $428; 11 bred and open heifers averaged $256, and 12 young bulls were taken at an average of $198.

The top of the sale was registered by the good young cow Fayne Spring Farm Pontiac De Kol with a record as a senior three-year-old of 21.21 pounds butter. She is a daughter of Spring Farm King Pontiac 6th, a 34-pound bull. She was purchased by W. A. Walker of Ripon for $1055, a conservative value.

R. C. Sturgeon, Tulare, secured the second highest priced female in Sadie Maid Pontiac Segis. D. D. Elmore of Tulare paid $700 for Merry Maid Canary. H. E. Cornwell of Modesto took several of the top females, including Melody Maid Canary 20.49 pound senior three-year-old twin to the Elmore cow, at $650, and the December, 1915 twins, Moorland Contenta Jetze and Moorland Hermana Jetze, at $600 each.

J. L. Sebastian of Wasco selected six females and a bull.

The herd bull Prince Hiske Walker was not sent through the ring.

The sale was managed by C. L. Hughes of the California Breeders' Sales and Pedigree Company, and the auctioneers were Colonels Ben A. Rhoades of Los Angeles and Bell of Tulare.

The complete list of sales follow:

2. Fidessa Helena, October, 1910, 31.7 pounds, T. J. Gist, Tulare, $600.
3. Fayne Spring Farm Pontiac De Kol, June, 1914, 21.21 pounds, W. A. Walker, Ripon, $1055.
4. Norena Princess Hengerveld, June, 1913, 22.28 pounds, J. L. Sebastian, Wasco, $260.
5. Melody Maid Canary, April, 1913, 20.49 pounds, H. E. Cornwell, Modesto, $[illegible].
6. Belle Pontiac Maid, November, 1916, George Beck, Tulare, $240.
7. Merry Maid Canary, April, 1913, D. D. Elmore, Tulare, $700.
8. Sadie Maid Pontiac Segis, July, 1916, R. C. Sturgeon, Tulare, $725.
9. Zampa Zoe, March, 1912, 16.35 pounds, Burr Farms, Los Angeles, $255.
10. Zampa Zoe Homestead Pride, April, 1915, 20.02 pounds, L. W. Bardsley, Tulare, $450.
11. Donna Maid Maria, April, 1914, J. H. Will, Tulare, $310.
12. Twilight Shadow of Packwood, September, 1916, J. L. Sebastian, $195.
13. La Mona Hengerveld of Packwood, July, 1917, R. C. Sturgeon, $195.
14. La Mona Hengerveld Segis Pontiac, September, 1916, Robert Whaley, Tulare, $235.

Satisfactory Sale of Putz' Registered and Grade Holsteins

On Wednesday, April 2, E. R. Putz of Laton closed out his Holstein holdings consisting of 45 registered cows, heifers and bulls and 45 grade cows and heifers. Seventeen registered cows and first calf heifers were cashed for an average of $331 and the general average for the registered end of the offering was $185. It might be stated that the average was held down by the fact that no especial effort had been made to condition the younger things. The grade cattle averaged $141, and indicated the keen demand that exists for grade dairy cattle in California just now.

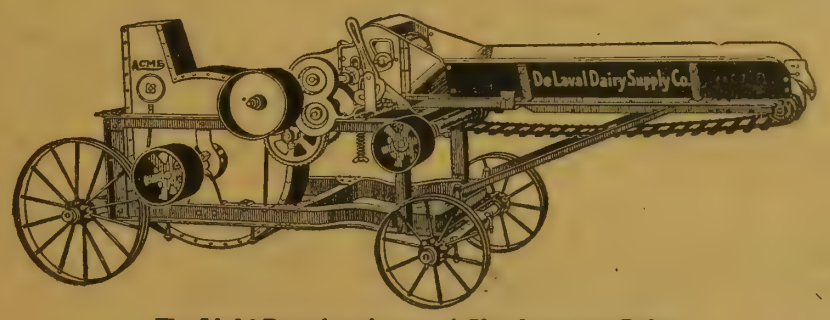
The top animal in the sale was the aged cow Cantate Wonder 2nd, a daughter of Arcady Pontiac Wayne Hengerveld. She was purchased by L. W. Bardsley of Tulare, for $600.

George P. Robinson of Sacramento was the heaviest individual buyer, securing 15 head. Robinson picked a number of exceptional bargains including the herd bull, Prince Lunde Korndyke 2nd, a grandson of the premier sire of the herd, Pontiac Korndyke, at $150.

The second highest priced female, princess Una Hengerveld, by the same sire as the top cow, was taken by the Burr Farm, Los Angeles for $450. Another daughter of the same sire was purchased by K. N. Mulder for $430. Mulder was one of the best buyers of the better sorts.

The sale was held under the management of C. L. Hughes of the California Breeders' Sales and Pedigree Company. Col. Ben A. Rhoades officiated with the hammer.

The catalogued animals sold as follows:



Females

2. Beauty Sunrise Hengerveld Laguna, March, 1916, Geo. P. Robinson, Sacramento, $175.
3. Snowflake Hengerveld Korndyke, December, 1917, L. W. Bardsley, Tulare, $90.
4. Lady Sunrise Hengerveld, September, 1918, R. C. Sturgeon, Tulare, $100.
5. Princess Butter Girl Lunde, March, 1916, Geo. P. Robinson, $200.
6. Laguna Pride De Kol, June, 1918, Geo. P. Robinson, $100.
7. Maude Onyx Korndyke, December, 1916, J. B. Roberts, $80.
8. Dottie Tueble Laguna, July, 1917, Geo. P. Robinson, $100.
9. Lady Hartog Laguna, November, 1917, Chas. Hubbard, Riverdale, $95.
10. Laguna Maud Korndyke, December, 1917, Geo. P. Robinson, $75.
11. Laguna Queen Korndyke, January, 1918, Frank Souza, Merced, $120.
12. Cantate Wonder Promise, February, 1918, Frank Souza, $130.
13. Princess Una Korndyke, March, 1918, Harry Hill, Riverdale, $85.
14. Queen Onyx Hengerveld, July, 1918, E. A. Pineo, Riverdale, $160.

ACME Feed Cutters

The Cylinder Cutter with the durable All-Steel frame

The Light Running Acme---A Size for every Dairy

The Combined Silo Filler, Hay Chopper and Alfalfa Meal Machine.

STEEL has replaced wood in all modern machine design. It's stronger more durable and "stays put."

The steel frame of the Acme Feed Cutter can't warp or sag. It permanently holds all bearings in rigid alignment, eliminating needless wear and vibration common to the old style wood frame cutters.

Chopped feed will eliminate a wastage of from 15 per cent. to 25 per cent. of your hay. Chopped feed is all eaten.

The light running qualities of the Acme are further increased by the triple frame bracing allowing three bearings for the cutter head shaft, which reduces vibration from that source to the minimum and economizes power.

THE Acme is the most efficient type of cutter—the cylinder type. Its spiral knives give greater capacity per hoursepower than any other types and produce a cleaner cut, more uniform quality of silage. It is the only type for producing chopped hay or alfalfa meal.

OTHER VALUABLE FEATURES. Non-cloggable six-fan blower with direct drive insures elevation; positive automatic safety device; reversing gears; low feed table; steel wheel mounting.

Why buy a cutter that can be used for silo filling only? With an Acme you can fill the silo and make the machine pay its way in one season by chopping your dry feed and making alfalfa meal.

More Power For Every Farmer

Every farmer—including YOU—needs and deserves the biggest power with the least possible weight and cost. When you buy this tractor you pay for 12-20 H.-P. and *get* 15-25 H.-P. In the

E-B 12-20 Model AA Tractor

(S. A. E. Rating)

you get a long list of special E-B features that will mean easier, better, more profitable farming. Here are a few of its advantages:

Four-cylinder kerosene motor, rated at 12-20 horsepower by conservative Society of Automotive Engineers' basis, actually delivers 15-25 horsepower in use; E-B patented enclosed transmission; dust-proof gearing; standard E-B construction; highest grade equipment, including Hyatt Roller Bearings; Ball Thrust Bearings; producer type Carburetor; K-W Magneto; high-grade Radiator; 88 parts heat treated. Pulls three plows in any ordinary soil; four in loose soil.

Ask your dealer or write us for complete facts.

Live Stock News Notes

Duroc-Jersey Sows Bring Big Money

R. K. Walker of Winsor Ranch, San Diego County, sends report of record sale of Duroc-Jersey sows by Ed. M. Kern of Stanton, Nebraska. The average made on 50 head of catalogued sows was $1,021, which beats any average made by any breed of swine more than $200.

There was a large crowd of breeders from all parts of the United States present and the bidding was lively on each animal sold. The breeders were there to buy sows bred to Great Sensation and Great Orion, and were willing to pay the price for them. The top of the sale, of course, was the world's champion sow of 1918, Long Gano. She was bred to Great Orion, the world's champion boar of 1918, and sold to J. G. Donohue of Holbrook, Iowa, at $4,250, the longest price ever bid on a bred sow.

Mr. Walker adds: "Great Sensation, the boar on which Kern made his reputation and the boar that made this sale possible, is a grandson of Great Wonder, the sire of our boar Great Model. We also own five sows and three boars sired by Top Sensation, the litter mate to Great Sensation, and considered by many the better sire of the two."

Witherow's Durocs Now in Sutter County

H. C. Witherow, who has been breeding Duroc-Jerseys in Shasta County for several years, has moved his herd to his farm in Sutter County. The farm is located three miles south of Live Oak, on the National Highway, which Mr. Witherow believes is a better location, putting him nearer the center of the pure bred live stock industry.

The herd boar at present is Johnson's Defender Jr. by Johnson's Defender, reserve champion at the 1917 state fair, and out of Cherry Chief Lady, the grand champion sow at the same show. His band of sows, consisting of 12 head, are all bred for March or early April farrow. One, Shasta Daisy, has already farrowed a litter of 12.

His favorite sow is Col. B's Queen 4th by Col. B 2nd and out of Advancer of U. F. 10th. The Advancer family has proven the greatest producers ever owned by the University Farm.

Just as rapidly as suitable animals can be secured the herd will be increased, and the farm is being shaped up for maintainging a large herd.

The Witherow herd will be shown at the state fair.

Transfer of Fine Holsteins

The Lewis Company reports the following sales: To Burroughs Brothers, who are operating a certified dairy near Santa Clara, Prince Creamelle Skylark Ormsby, a good son of Sir Skylark Ormsby Hengerveld; to Chas. Monighetti, formerly of San Luis Obispo, now of Santa Clara County, Toyon Holland Valdessa, and five heifers; to Warne & Sons of Holtville, Toyon Perfection Valdessa; to F. W. Wehner of San Jose, ten heifers.

New Dairy Project at Durham

Geo. C. Kreutzer, superintendent of the State Land Colony at Durham, has announced that plans have been inaugurated for establishing a cooperative dairy association among the settlers of the colony.

It is proposed to finance the association to the extent of $50,000, which will be used for the purchase of cows and the building of a plant to distribute the product.

The members of the Durham Cooperative Stock Breeders' Association some time ago decided that only Holstein cattle and Duroc-Jersey swine would be bred by the members.

Another Holstein Sale

F. H. Everson, sales manager for the Great Lake Mills Holstein semi-annual consignment sale, announces the next sale to take place May 6 and 7 at Lake Mills, Wisconsin. These great breeders sales are attracting buyers from all parts of the country.

Chapple Increases Berkshire Herd

Wm. T. Chapple, owner of the Fair Oaks Ranch, Willits, has purchased two bred Berkshire sows from the

Castleview herd at Santa Rosa. One of the sows was sired by Grand Leader 2nd and is bred to Mayfield Rookwood. The other sow is a daughter of Ames Rival 102nd and bred to Mayfield Rookwood.

Mr. Chapple states that the demand for breeding stock has been so keen that he found it necessary to increase the size of his herd.

Mr. Chapple has secured the service of E. W. Curtis, a well known young live stock man formerly in charge of the Alexander & Kellogg herd of milking Shorthorns. Curtis will be in charge of the Fair Oaks herds of Shorthorns and Berkshires.

Percherons in Demand

N. W. Thompson of Patterson, importer of Percherons and Belgians, reports sale of Percheron stallion Fernando 85689, to W. H. Klehn of Newman. Mr. Thompson writes: "Fernando is a 2-year-old black, weighing 1900 pounds, with plenty of bone, style and action, and the farmers about Newman are to be congratulated upon having such a good stallion in the community to breed to. I also sold last week a Percheron and a Belgian to parties in Nevada. I also disposed of 16 head of grade mares and geldings to S. J. Elliott of Turlock."

Famous Cattle Ranch Sold

Announcement has just been made that the Howard Estate has sold the famous 50,000 acre Quinto Ranch in San Joaquin and Santa Clara Counties to a company headed by Fred Landsdale, a banker of Palo Alto.

The Quinto Ranch was operated by the Howard Cattle Company for a number of years but for the past few years it has been leased. The property is considered one of the best cattle ranges in California.

Aberdeen-Angus Calendar

The American Aberdeen - Angus Breeders' Association, Union Stock Yards, Chicago, has issued a calendar illustrated by the 13 International grand champion carloads of steers and the 1918 grand champion steer. The calendar may be obtained by writing the association.

Thorp Jerseys to Hearst Estate

J. E. Thorp of Lockeford, owner of the Mossdale herds of Jersey cattle and Duroc-Jersey swine, reports the sale of three Jersey cows to the Hearst Estate. One of these cows he had expected to show this fall.

His herd is headed by Jolly Senator Raleigh, undefeated in class wherever shown and reserve grand champion at Sacramento last year.

Among his cows is Salome of Mossdale, grand champion at Sacramento last year and undefeated throughout the entire show circuit.

Several cows are now on test with others to follow on freshening. He has entirely sold out of Duroc-Jerseys, there remaining on the farm only his brood sows and animals reserved for his show herd this fall.

Volunteer's Queen has just farrowed 12 pigs from which he expects to select his futurity candidates.

At the head of his herd is Brookwater Regulator, a Mumford bred boar, and Freddie You'll Do, by Johnson's Defender.

The latter boar will be developed for the fall shows.

A number of improvements are contemplated after which his herd will be materially increased.

Oregon Jersey Breeder in California

H. West, Scappoose, Oregon, breeder of Jersey cattle, is visiting some of the breeders in California.

Mr. West has made three importations from the Island and will, as soon as conditions are a little more settled, make another.

Shorthorns for Knights Valley

A number of pure bred Shorthorns are to be placed immediately upon the Wes. Hooper ranch in Knights Valley by Frank P. Tuttle, the new owner. The price paid for the property was $75,000. Tuttle announces that he will use it for breeding prize stock.

Decides to Stay in Duroc Game

Dr. L. J. Belknap of San Jose, who, on March 18, dispersed his herd of Duroc-Jerseys, states that he has decided to continue the business, but on a larger scale.

He is negotiating for a ranch a few miles from San Jose which will be thoroughly equipped and stocked with the best Durocs he can purchase. As a starter he repurchased the sow Mabel D. which was sold in the sale to R. N. Jennings for $500.

He has written a number of Eastern breeders regarding stock and states he expects to purchase the very best animals and blood lines he can find. He also states that next year he will have a sale of 100 head.

Merrill & Son Have Crack Berkshire Boar

R. J. Merrill & Son, Berkshire breeders of Gilroy, had the misfortune of having their herd boar, Winona Compton 13th, injured in one of his front legs.

This boar is probably one of the best sons of Laurel Champion, having good length and depth, high arched back and very heavy bone.

It is hoped he will soon recover as he is too valuable a boar, both for the breed and his owners, to lose.

All their sows are bred for March and early April farrow, several litters having already arrived.

They expect to show at the leading fairs this fall and have reserved two boars and four gilts for the junior yearling classes.

Mr. Merrill states they have adopted the policy of developing their young stuff before offering it for sale, a policy that is to be highly commended.

Merced Jersey Breeders Meet

The Merced County Jersey Breeders held a meeting on Wednesday, March 12, at the ranch of David Larson, Stevinson. Ways and means of Jersey advertising were discussed. Mr. Voorhies of the University Farm, Davis, was present and addressed the breeders. The election of officers took place, in which David Larson of Stevinson, was elected president. E. W. Doane of Merced, secretary, and E. E. Greenough of Merced, treasurer.

Johnson Has Good Duroc Trade

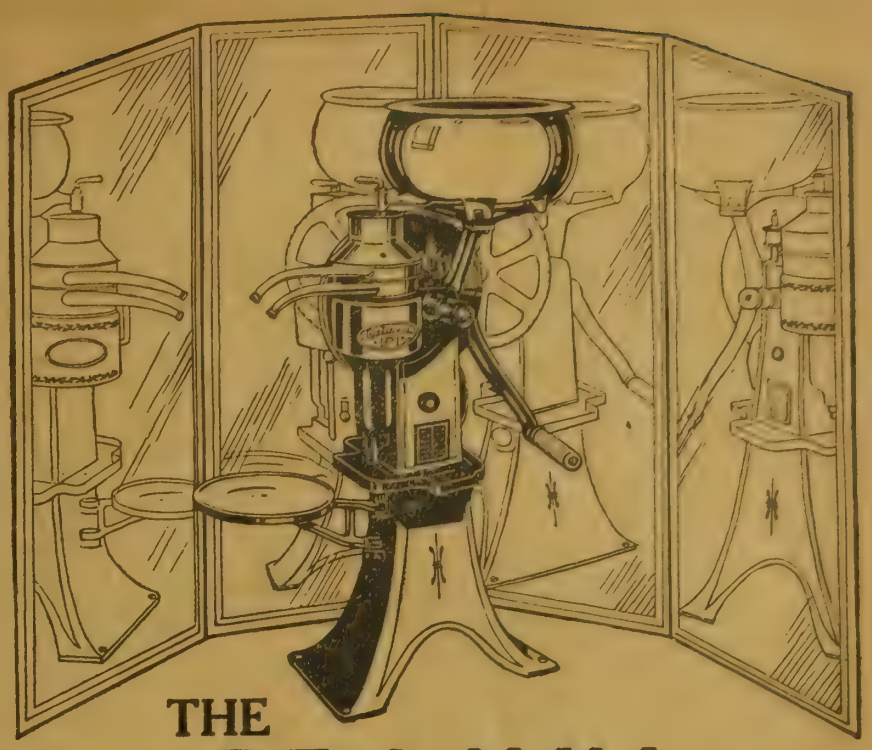
Frederick M. Johnson, Duroc-Jersey breeder of Napa, has recently added to his herd the sow, King Orion Lady, by King Orion Cherry and out of a Taxpayer dam.

She is due to farrow soon to the service of Iowa Orion King, a son of Orion Cherry King Jr., the grand champion boar at the National Swine Show in 1916.

Johnson is counting on this litter to furnish his futurity candidates at the state fair this fall.

He had the misfortune to lose his aged boar recently, but has an excellent prospect in California Defender, a son of Johnson's Defender, and out of Kings Lady 3rd, junior champion at the 1917 state fair.

Johnson states that the past year has been his largest and most profitable. Recent sales include service boars to C. Madsen, Marysville, and N. Carboni, Napa. Boar pigs have been sold to W. L. Mitchell, Napa; Allen Baker, Nashmeade; G. Fitzhugh, Nashmeade; F. Korbel & Bro., Guerneyville; Frank Johnson, Guerneyville; six bred gilts were sold to L. H. Welch, Chowchilla; three to Harvey Berglum, Dixon; one each to A. L. Emery, San Juan; G. C. Grady, Woodland, and Thos. Harrison, Santa Rosa.



McCarty to Buy Eastern Sow

A. D. McCarty of San Francisco, who maintains a splendid herd of Poland-Chinas at his Riverina Farms, near Modesto, writes that he has recently commissioned Professor L. A. Weaver of the University of Missouri who judged Poland-Chinas and Duroc-Jerseys at the 1918 California state fair, to select and purchase for him a sow that will have sufficient class to be a factor in the senior yearling classes at the fall shows.

McCarty is determined to have one of the first herds of the West and with this idea in mind he has exercised unusual care in the selection of his foundation animals.

THE
DE LAVAL
CREAM SEPARATOR
Every Reflection Shows Perfection

VIEWED from every angle, the De Laval is distinctly in a class by itself. It has a business-like appearance. It looks as if it were well made, and it is. It looks sturdy, and it is. There is no make-believe about it anywhere, from the wide-spreading substantial base to the solid, seamless, symmetrical supply can.

It's no wonder that big dairymen and creamerymen who have for years made a careful study of dairy methods and machinery refuse to consider any other separator but the De Laval. They know that from every angle—clean skimming, ease of operation, freedom from repairs, durability—there is no other cream separator that can compare with the De Laval.

They know that it has a record of 40 years of service behind it. They know that it can be depended upon. They know that they can't afford to take chances with any other cream separator—

And neither can you.

Order your De Laval now and let it begin saving cream for you right away. Remember that a De Laval may be bought for cash or on such liberal terms as to save its own cost. See the local De Laval agent, or, if you don't know him, write to the nearest De Laval office as below.

held at Martinez, April 19. The sale is the first of series that is being sponsored by the Western Berkshire Congress for the purpose of demonstrating to California farmers the qualities of the Berkshire.

In the intial sale, 33 boars, sows and gilts, selected from many of the best herds in California will be offered.

Frank B. Anderson, Box 724, Sacramento, secretary of the congress, is managing the event and catalogs may be obtained from him.

Wm. Bernstein's Poland-China Sale

Wm. Bernstein, who, for a number of years has been breeding Poland-China swine at Hanford will hold a public sale Saturday, April 26.

The offering should be of interest to both breeder, farmer and pig club boy, as it will consist of bred sows, gilts ready to breed for fall litters, young service boars and nicely weaned pigs.

Mr. Bernstein states that he has varied his offering from young pigs to aged animals in order to reach a larger number of buyers. The young pigs afford the opportunity of establishing foundation herds of pure bred Poland-Chinas to those who might not be in a position to purchase aged animals.

John Bernstein Brings Poland-Chinas

John Bernstein, of Hanford, who breeds Poland-Chinas, has just returned from a trip through Kansas, Nebraska, Iowa, Missouri, Illinois and Ohio, where he purchased 21 fall gilts, three fall boars and two bred sows.

He also secured for H. D. McCune of Lemoore three bred sows, for C. G. DeRaad, Lemoore, one bred sow, for Dimmick Brothers, Lemoore, one bred sow, and for Hoag & Son, Hanford, a bred sow and a young boar.

C. A. Vaughn accompanied him as far as Kansas City and secured a number of animals for his herd.

Kounias Building and Busy

George Kounias, owner of Kounias pure bred stock farm, Modesto, has under construction a large dairy barn, which when completed, will afford him a better opportunity for caring for his herd. He will in the next two or three weeks put six of his cows on official test.

BELKNAP DUROC-JERSEY SALE

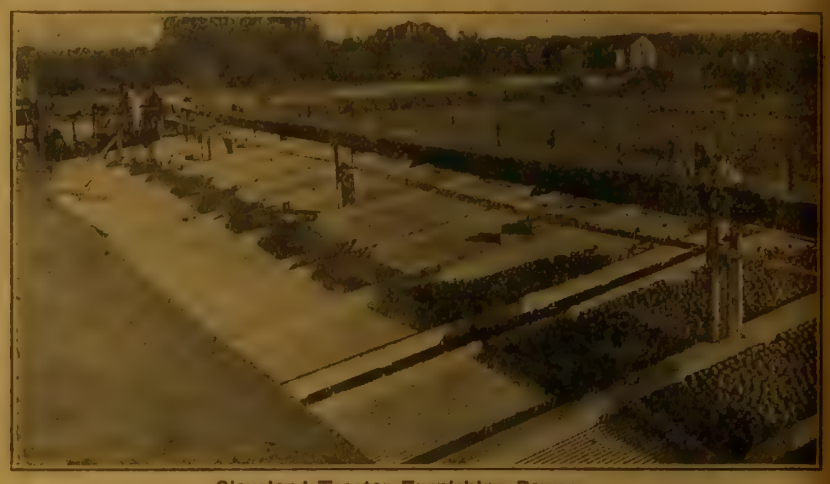
By Bruce S. Bennett

The following account of sales made by L. J. Belknap Duroc-Jersey ranch was prepared by Mr. Bennett and put in type for use the week of the sale. Owing to mass of material, made necessary by the many public sales, especially of beef stock, and by error, this account is delayed.

It remained for Dr. L. J. Belknap of San Jose, retiring for the present from the breeding of Duroc-Jerseys, to demonstrate that pure bred swine of quality can be sold at public sale regardless of location, at profitable prices.

A few weeks ago the Doctor announced a dispersal sale of his herd and buyers were attracted from all over the state.

The first animal offered was the sow Lucy Orion, which was sold to A. L. Emery of San Juan for $1100, who also purchased the boar Orion Model Jr. for $1000 and the sow Lady Monarch for $375.



The sow Mable D. was purchased by R. N. Jennings of San Jose for $500.

The remainder of the sale consisted of bred gilts, young boars and weanling pigs. The average for 20 head, consisting of the aged animals, bred gilts and young boars, was $259.12, while the average for the 26 head, including the young pigs, was $210.20.

Ord L. Leachman, the live stock auctioneer of Sacramento, cried the sale, and aside from the high average he secured is to be commended for the rapid manner in which the animals were sold.

Following is the list of buyers and price paid:

The Silos of Europe

The plodding farmers of Europe early recognized the value of silage. So they store their crops in deep pits dug in the soil.

Much of the silage is spoiled by this crude method. Much of the feed value escapes. Still there is some *succulent* feed for the stock when pastures are bare.

The European idea is good, but use of the idea is poor. Progressive American farmers are making the best possible use of many crops by storing them in SIMPLEX SILOS.

They Make Feeding Pay. Here are a Few Reasons Why:

1. **Wood construction** — One-piece unspliced staves of Oregon Pine (Douglas Fir) form the silo itself. Wood is the natural preserver. It prevents the ensilage from spoiling.

SIMPLEX SILO

2. **Good quality steel** is used for hoops and other hardware. A double interlocking system of anchoring gives the Simplex strength to resist storms.

The PAPEC Saves too--

3. **The Crissell Tangent Top** device holds the shape always round. The top stays the same size as bottom. Thus settling of the ensilage cannot form rotting air pockets. Simplex prevents waste.

Sooner or later you will build a silo. Find out more about the Simplex. Mail the coupon in the corner.

Just as the Simplex saves the food in the crop, Papec Ensilage Cutter saves power and cost in filling the silo. **It throws as well as blows.** Mail the coupon that asks for more information about Papec.

Our Stockholders

There are over 135,000 stockholders who own the American Telephone and Telegraph Company. This great body of people, larger than the entire population of such cities as Albany, Dayton or Tacoma, share the earnings produced by the Bell System.

More than 45,000 of these partners are workers in the telephone organization. They are linemen, switch board operators, clerks, mechanics, electricians.

The vast property of the Bell System represents the savings of these thousands of people, in many cases *all* their savings.

In the truest sense of the word this big public service corporation belongs to the people. The people own it and the people receive the profits. More than 93% of its stock is owned by persons holding, each, less than one-ninth of one per cent.

The Bell System is a real industrial democracy. On its economic operation depends the future independence of many citizens of small means, as well as the profitable employment of thousands of other men and women.

AMERICAN TELEPHONE AND TELEGRAPH COMPANY

Perforated Tree Protectors

that will keep squirrels, rabbits and gophers from barking your trees and give perfect protection from the hot sun, sand storms, raking bark in cultivation, etc. We make a number of kinds of wraps, among these are the Yucca which has the fastening wire entirely around it. Tell us your pest and we will tell you what kind to use.

Collapsible Planting Pots

These pots are bottomless. This allows you to plant pot and plant, never disturbing your plant nor stopping its growth in transplanting a single hour. For starting early vegetables, such as tomatoes, cabbage, egg-plant, cauliflower, cucumbers, cantaloupes and squash. Also, for propagating rose cuttings, geraniums, eucalyptus or olive cuttings. It is the most practical pot on the market today for propagating work. Write us for samples of either pots or protectors. Tell us which you are interested in.

The Expan Co.
935 E. Central Ave. Redlands, Cal.

STATEMENT OF THE OWNERSHIP, MANAGEMENT, CIRCULATION, ETC., REQUIRED BY THE ACT OF CONGRESS, MARCH 21, 1916.

of California Cultivator, published weekly at Los Angeles, Cal., for April 1, 1919.
State of California, County of Los Angeles, SS.

Before me, a Notary Public in and for the State and County aforesaid, personally appeared Frank H. Thomas who, having been duly sworn according to law, deposes and says that he is the publisher and business manager of the California Cultivator and that the following is to the best of his knowledge and belief, a true statement of the ownership, management (and if a daily paper, the circulation), etc., of the aforesaid publication for the date shown in the above caption, required by the Act of August 24, 1912, embodied in section 443, Postal Laws and Regulations, printed on the reverse side of this form, to-wit:

1. That the names and addresses of the publisher, editor, managing editor, and business managers are:

NAME OF—	POST OFFICE ADDRESS.
Publisher, Cultivator Publishing Co.,	Los Angeles, Cal.
Editor, C. B. Messenger,	Los Angeles, Cal.
Managing Editor,	
Business Manager, Frank H. Thomas,	Los Angeles, Cal.

2. That the owners are (Give names and addresses of individual owners, or, if a corporation, give its name and the names and addresses of stockholders owning or holding one per cent or more of the total amount of stock.)

Cultivator Publishing Co.	
Frank H. Thomas,	Los Angeles, Cal.
B. M. Teague,	San Dimas, Cal.

3. That the known bondholders, mortgagees, and other security holders owning or holding one per cent or more of total amount of bonds, mortgages, or other securities, are: (If there are none, so state.)
None.

4. That the paragraphs next above, giving names of the owners, stockholders, and security holders, if any, contain not only the list of stockholders and security holders as they appear upon the books of the company but also, in cases where the stockholders or security holders appear upon the books of the company as trustees or in any other fiduciary relation, the name of the person or corporation for whom such trustee is acting, is given; also that the said two paragraphs contain statements embracing affiant's full knowledge and belief as to the circumstances and conditions under which stockholders and security holders who do not appear upon the books of the company as trustees hold stock and securities in a capacity other than that of a bona fide owner; and this affiant has no reason to believe that any other person, association, or corporation has any interest direct or indirect in the said stock, bonds, or other securities as so stated by him.

5. That the average number of copies of each issue of this publication sold or distributed, through the mails or otherwise, to paid subscribers during the six months preceding the date shown above is———.
(This information is required from daily publications only.)

FRANK H. THOMAS, Manager.

Sworn to and subscribed before me this 26th day of March, 1919.
H. E. STORRS, Notary Public in and for Los Angeles County, California. (SEAL.)
(My commission expires March 22, 1921.)

Brooding and Feeding Baby Chicks

By Russell F. Palmer

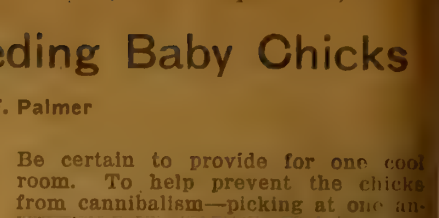
MILLIONS of baby chicks are annually lost because of wrong methods and mistakes in brooding and feeding. Considering present egg prices and, if it requires two eggs on an average to produce one chick, then adding the cost, time and worry of incubation egg plus the value of baby chick food consumed before a chick dies, it will be seen the baby chick loss summed up in dollars and cents represents an enormous figure each year.

Thousands attempt poultry raising every spring who quit the effort through disgust because of this loss and disappointment which all too often follows. A little watchfulness, cooperation and a willingness to help a neighbor on the part of the more experienced poultry raiser will often safely steer the amateur raiser to success. Therefore let me urge that we help one another.

It behooves us to use methods which insure the lowest loss, most economical and quickest growth. Here at the American Poultry experimental station we use largely the brooder stove hover method of brooding. We have found this method dependable and it permits raising a larger number of chicks in proportion to labor. There are many of these stoves on the market and most all of them are good and to be depended upon. These brooder stoves are designed to brood from 250 to 750 chicks at a time. They do this very well for the first three to five weeks, after which greater success is more common if the brood is culled or separated into lots of 150 to 350 chicks depending upon the size of the house and the amount of range surrounding it, which is not used by other fowls or chicks.

We have found here that 250 to 350 together, even at the start will do somewhat better than if a larger number are put together. For this style of brooding we use a house 10x20 feet. The house has a partition in the center with a runway for the chicks to go from one room to the other and a swinging door for the attendant. The stove is placed on one side of the partition and the cool room is used for feeding and exercise. It is necessary to have a cool room so the chicks can get away from the heat. This is one of the secrets of successful brooding. It also pays to give the little fellows access to the ground as soon after starting to brood them as possible. Even the second and third day is none too early, care being taken the first few days to be certain they know the way into and out of their house. Provided the sun is shining and no hard winds can hit them, baby chicks will do well if allowed to run in and out even on fairly cold days. Do not put them out on hard frozen ground.

The houses for these brooder stoves are built similar to laying or breeding houses. Special care must be taken to insure proper house ventilation. A slow movement of fresh air coming in on one side a foot above the floor and raising gradually upward as it warms and the oxygen from it has been consumed, until it reaches a point close to the ceiling where there should be an exit opening, will help keep the house free from impurities and foul odors, thus maintaining health, vigor and appetite among the chicks.



We would not build a special brooder house that could only be used three or four months a year. We locate these houses where the chicks can have plenty of range after they are partly grown. As soon as they are old enough to do without heat we remove the brooder stove and put in temporary roosts. The chicks roost in this house until fall or winter when we cull them and select the choicest for laying and breeding. In this way you avoid handling them so often, they are accustomed to their quarters, are not checked in their growth by moving and you get the benefit of your equipment throughout the year. Better to move the stove than the chicks.

Tack burlap cloth over ventilators to make the house comfortable and at least provide some method of ventilation near the floor, but avoid drafts. Be certain to provide for one cool room. To help prevent the chicks from cannibalism—picking at one another's toes or vents—paint the window panes with a bluish or whitish frosting. You want light in your brooder house but not the direct rays of the sun. Keep the chicks busy and active. Put fresh earth on the floor in one corner of the room every two or three days. This will help prevent foot and leg weakness, besides the little fellows like it. If they show signs of developing cannibalism, grind some lean meat and mix equal parts of bran, shorts, corn meal and ground meat with a little water, just to moisten it a trifle. After it is mixed run it through a sausage mill or meat grinder and then feed it to the chicks every day.

You will not be troubled with the chicks piling up and crowding at night in a room where you use these brooder stoves if your room is kept warm enough.

Start feeding the chicks when 60 to 72 hours old, but first see that each has a drink of tepid warm water to which has been added five medicine dropper drops of carbolic acid to each pint. This will help prevent bowel trouble. We have also found some of the intestinal antiseptics advertised for prevention of bowel trouble and diarrhoea when used in drinking water to be very good.

Cover the floor of the brooder rooms with clover or alfalfa chaff or fine cut straw. Don't have this too deep. Keep sour milk or buttermilk before them to drink at all times from the first day. For the first two or three days feed a mixture of two-thirds rolled oats, one-third wheat bran, mixed with hard boiled eggs, a little powdered charcoal and fine bone meal. Feed a little five times a day for the first three days. Then give two meals a day of commercial chick feed. The

Keep Setting Hens Free from Lice

Put Dr. Hess Instant Louse Killer in the nests before adding the litter and eggs, then the brood will come off free from vermin. Put it in the dust bath—that's always a good thing to do. All fowls will sift it into the feathers and the lice will be quickly killed. Just as good for animals as for poultry. With one hand stroke the hair the wrong way, with the other sift in Dr. Hess Instant Louse Killer. Especially good for lousy colts and calves right now.

GUARANTEED

The dealer who sells you Instant Louse Killer is authorized to refund your money if it does not do as claimed.

first mixture is fed morning, noon and night and the chick feed is given between meals. As they become older, gradually eliminate the rolled oats until you use only the chick feed and keep before them a dry mash mixed in the following proportions: Ten pounds wheat bran, two and a half pounds ground oats, five pounds shorts, five pounds corn meal, two ounces fine charcoal and two ounces fine salt. If you cannot secure sour milk or buttermilk then mix two pounds of dry beef scraps with the above. If you use any form of milk, keep it before them at all times or at least the first half hour of the day. They need some green food. Use clippings from sprouted oats or cut up some onions or lettuce occasionally.

STORRS EGG LAYING CONTEST

Storrs, Connecticut, March 28, 1919. —Report for the twenty-first week ending March 27. Perhaps the most recent development in the egg laying contest at Storrs is the fact that the pen of White Wyandottes from Bridgeton, Rhode Island, that has been leading all other pens for the las thirteen weeks, has now been relegated to second place. A pen of Barred Rocks entered by Jules F. Francais, Westhampton Beach, Long Island, outlaid all other pens in the twenty-first week. These ten birds produced 51 eggs, bringing their total up to 717 eggs since the first of last November. The pen is going strong, and it looks as if they would be able to hold this lead, at least for several weeks. The Leghorns are picking up, and it's only a question of a very short time when the list of winners may be entirely reversed. The light breeds are sure to get into the honor column within the next week or two.

The total production for all pens for the twenty-first week amounted to 3301 eggs, or a yield of a little over 47 per cent. This was a little more than twice the number of eggs necessary to pay for the feed the hens consumed during the week. The following formula is useful for determining the exact number of eggs hens must lay to pay their board bill: divide the price of feed per hundred by the price of eggs per dozen and multiply by three. The result is the per cent egg yield necessary to pay for the feed. Suppose feed costs $3.20 and eggs are 40 cents a dozen. Dividing $3.20 by 40 cents gives eight, and multiplying by three gives 24 for the answer, which means that every 100 hens must lay 24 eggs a day to pay for their feed when the above prices prevail. The foundation for this formula is the fact that when all feed is purchased, a hen will consume about 90 pounds in a year or four ounces in a day.

The three best pens in each of the principal varieties are as follows:

Barred Plymouth Rocks

Jules F. Francais, 717; Laurel Poultry Farm, 634; Rook Rose Farm, 559.

White Wyandottes

Obed G. Knight, 698; Patrick F. Sullivan, 633; Laurel Hill Farm, 589.

Rhode Island Reds

Laurel Hill Farm, 679; Deer Brook Poultry Farm, 561; Natick Farm, 553.

White Leghorns

A. P. Robinson, 618; S. G. McLean, 609; James O. LeFevre, 562.

Miscellaneous

Pequot Poultry Farm (Rhode Island Whites), 526; H. A. Wilson (White Rocks), 466; F. W. Cumpstone (Rhode Island Whites), 412.

THE SUBURBANITE

It was the busy hour of four,
When from a horticultural store
Emerged a gentleman, who bore—
1 hoe
1 spade
1 Wheelbarrow.
From thence our hero promptly went
Into a seed establishment,
And for these things his money spent—
1 box of bulbs
1 lot of shrubs
1 package of assorted seeds.
He has a garden under way,
And, if he's fairly lucky, say,
He'll have about the end of May—
1 nasturtium
1 radish
1 pot of mignonette.
—Cartoons Magazine.

SAN DIMAS, CALIFORNIA

THE SELF-OILING WINDMILL
has become so popular in its first four years that thousands have been called for to replace, on their old towers, other makes of mills, and to replace, at small cost, the gearing of the earlier Aermotors, making them self-oiling. Its enclosed motor keeps in the oil and keeps out dust and rain. The Splash Oiling System constantly floods every bearing with oil, preventing wear and enabling the mill to pump in the lightest breeze. The oil supply is renewed once a year. Double Gears are used, each carrying half the load.

We make Gasoline Engines, Pumps, Tanks, Water Supply Goods and Steel Frame Saws.

Western Canada's "Horn of Plenty" Offers You Health & Wealth

Western Canada for years has helped to feed the world—the same responsibility of production still rests upon her. While **high prices for Grain, Cattle and Sheep** are sure to remain, price of land is much below its value.

Land capable of yielding 20 to 45 bushels of wheat to the acre can be had on easy terms at from $15 to $30 per acre—good grazing land at much less.

Many farms paid for from a single year's crop. Raising cattle, sheep and hogs brings equal success. The Government encourages farming and stock raising. Railway and Land Co's. offer unusual inducements to Home Seekers. Farms may be stocked by loans at moderate interest. Western Canada offers low taxation, good markets and shipping; free schools, churches and healthful climate.

For particulars as to reduced railway rates, location of land, illustrated literature, etc., apply to Supt. of Immig., Ottawa, Can., or

Household Department

HE WORRIED

He was one of the worrying kind—
Born with, I fancy, a worrying mind;
Worried whenever it threatened to rain,
Worried whenever the sun came again,
Because he was sure when the sunshine was o'er
He'd wake up to find it was raining once more.
He had a worrying look in his eye
And a worrying smile and a worrying sigh.
Never was he in too much of a hurry
To think of his trouble and sit down and worry.

The children, they worried him sorely, indeed;
He couldn't afford to supply every need;
It gave him a horrible fit of the blues
To look at the holes in their stockings and shoes.
But all of the worrying this fellow did
Never purchased new shoes for the feet of a kid;
They struggled along and they got on without
The garments he fretted and worried about,
And none of his worrying, early and late,
Ever put any pie on a little girl's plate.

He worried because he was falling behind.
Good jobs were scarcer and harder to find.
Worried himself so he scarcely could sleep,
Because he'd a job he perhaps couldn't keep.
The longer he worried the worse matters grew—
Each worry seemed to be followed by two.
Mountains of trouble loomed up in his way,
Bills kept on growing that he couldn't pay;
Got in a corner and couldn't get out,
Blocked by the things that he worried about.

Don't be a man of the worrying kind.
Don't be a slave to a worrying mind.
When you're in trouble (and none lives without it),
Don't sit and worry. Do something about it.
Get out and hustle and keep in the race,
Battle your cares with a grin on your face.
Worrying never has paid up a bill
Or lifted a mortgage, and it never will.
Life and its joys travel by, in a hurry,
The chap who does nothing but stand still and worry.

—By Edgar A. Guest.

LIVE STOCK FARMING IN NEBRASKA

By H. J. McLaughlin

A BEAUTIFUL picture was formed in my mind one Sunday evening this winter, when I promised my two boys that I would do the chores for them.

As I leaned up against the south side of the barn, out of the wind, the hired man scattered out a load of corn fodder across the meadow. That was the hay for 60 odd head of Percherons that night. Then I took a sack of oats and went to feed the calves, all Herefords and all alike. A farmer friend visiting us said that he never saw such an impressive sight in a cattle lot before. As we went from lot to lot feeding the Herefords of different ages, I could see plainly why this man was so pleased. As the calves just weaned came running up over the hill, bucking and shaking their wintry coats and tossing their saucy heads all as white as snow, my heart was moved and I gave them a little more oats than I ever did before, because I knew that even though feed was high and scarce, every bushel of oats these calves ate was going into money making cattle. The cows, the young heifers, and the sire of these calves, all fared extra well that Sunday evening for I like to see them eat, go away, and lie down contented as it were at the end of a Perfect Day.

No sooner had I finished the cattle part of my chores than I heard old Sidonia nickering at the barn door. There were all the Percheron mares with foals wanting in for a bite of grain. That told me that the boys had been in the habit of feeding these faithful matrons and their colts just as I like to feed the calves. I let them all in and gave them a washpan of oats in each box, mother and foal alike. When they had finished, I turned them back to the pasture. This friend watching the mares and colts go off said: "Where is your tractor?" I said, "Let's go into the house and I'll tell you why I don't use a tractor. This is my reason. Twelve years ago, I bought the old Percheron mare Sidonia, in foal, her yearling filly and a weanling. She was then 11 years old. From that start I have produced 39 head of living Percherons, 15 head of which have been sold at a total of $7350. There are now on the farm 24 more descendants of this old mare that I value at a little over $6000 at present values for Percherons. I sold one stallion out of this old mare for $1300. I don't farm with a tractor because I can't afford it. More dollars worth of Percherons are sold off my farm every year now than my total feed bill, and the mares do the work of tilling a section of land. Besides last spring my attention was called to the fact that we were plowing for corn with three 14-inch two bottom gang plows and that the power we were using was 15 pure bred mares and every one of them heavy in foal. We hitched three to the rear team and a pair in the lead. I have said to every tractor salesman who has talked to me: "Whenever you can put a tractor on my farm that will do my work as cheaply as my Percherons, I am ready to buy a tractor." I mean it, too, for I am in the business of farming as a money making proposition, and whenever mechanical power can be so perfected that it can compete successfully with good Percheron mares in working my land and doing it cheaply, I am ready to buy a tractor and sell off some Percherons. This friend who was visiting me has a tractor and 12,00-pound horses. These are usually found working together on Nebraska farms, but one seldom ever finds good draft horses and a tractor owned by the same man.

After my friend left that evening, my wife was curious to know why it took me so long to do the chores. She said: "You think the boys waste a lot of time chewing." Well I had to admit that it took longer than I had anticipated because I like to stand and watch the calves and the colts eat. She said: "Our boys take after their father in some things and I expect that is one of them." That set me to thinking and I wondered if the fact that we were breeding Percheron horses, Hereford cattle, and Duroc Jersey hogs was largely responsible for my boys staying on the farm instead of seeking the city. Young men are usually progressive and want to get ahead and there is no way that they can accomplish so much on the land as by breeding good pure bred live stock. Then every bushel of grain or ton of hay that is raised and fed into such animals, goes much farther and makes more money than if fed into common scrub stock. I have been a cattle feeder and breeder ever since I came to this farm in Nebraska 28 years ago and although I have been in the Hereford business only a few years, I can see plainly that our farm will net $5.00 now every year from our white-faced cattle, where it would not make $1.00 before when we raised and fed common stock cattle. Whenever a father can go to his son and present such encouraging figures it makes a splendid argument why the boys should stay on the farm and

raise good live stock. Then the doing of the chores becomes a pleasure instead of a burden and more often than not successful farmers are made out of men who otherwise would be failures.

GRANDMA BROWN'S HOMELY HINTS

By Minnie Embree Parker

"Good morning, Grandma Brown," said young Mrs. Smith, "I am in need of advice, and as you have been a housekeeper for so many years, I believe you can help me."

"Come in, Neighbor," was the cordial invitation, "and I will gladly give you any assistance in my power, for I have been in trouble myself, and know how good it is to be helped out. Is it a new dress for the girl or how to help Johnny have better table manners?"

"Neither. It is simply this: the doctor has told me that I must rest, but how can I, with a family to take care of? I have read of a mother who took her baby and lunch and stayed all day in the park every day through the summer, growing well and strong. But I cannot do that as my children are in school and must be kept clean and fed, and I am the only one to do it."

"What you need," said Grandma, "is to learn how to rest while you work. We read a great deal, these days, about the conservation of food, but I have seen very little about conserving strength, and yet it is a very important thing. How many unnecessary steps do you suppose you took this morning? 'Make your head save your heels,' my mother used to say. Did you carry something upstairs or down cellar and come back empty-handed, making another trip later after something you might have brought back with you the first time?"

"The old adage, 'Have a place for everything and everything in its place,' is a wonderful help in making housework easier," continued Grandma Brown. "I used to think I was too tired to carry something into another room to put it away, but I found out that when I wanted that article at some other time and had to ransack the whole house to find it, that I was 'penny wise and pound foolish,' as the old saying goes. Also it tires one more to work in a room that is 'all cluttered up' than where everything is in order."

"It is strange I never thought of those little things making so much difference," Mrs. Smith said. "Since you have called my attention to it I do remember having made a number of extra trips this morning. I thought you would tell me to buy an electric washer and other labor-saving inventions."

"Yes, those things are good, if one can get them," Grandma replied, "but let me tell you how to make things as easy as you can without them. My mother used to have a recipe for a washing fluid which helped to take the dirt out of the clothes, but when I have been without that I have used a little common kerosene oil in the suds in which I boiled my clothes before rubbing, after they have soaked, or not, just as you choose, though I think if you wet them and rub soap on the dirtiest spots, then roll each garment up tight, letting them stand all night, they will wash easier."

"Would you mind telling me how to make that washing fluid?" asked Mrs. Smith.

"I will gladly tell you. Empty a can of lye into an old galvanized tub, or something the lye will not spoil, and pour onto it one gallon of boiling water, then add one ounce each of salts of tartar, borax and salts of ammonia, which you can buy at the drug store for a small price, and when cool, bottle it up tight. Add one-half cup to the suds in which you boil your clothes. Keep them well stirred and punched and you will be surprised at the small amount of rubbing required. You have often seen a woman pick up a tub of water and empty it, but it never pays a weak woman to do that. Just take a piece of hose and siphon it off, busying yourself with something else while it runs, if you are not tired enough to rest. And right here let me say, it is economy to rest before you get too tired, for a rest at the right time is the 'stitch in time that saves nine.' You will find it a help, also, to plan for dinner on wash day those dishes which are the easiest to prepare."

"Please tell me how to siphon water out of a tub," said Mrs. Smith.

"You are not the only one who doesn't know how to make water run uphill. I take it for granted that you always use a hose to bring the water from a faucet to your tub. Just place the free end of it in the dirty water which is to be emptied, and turn on the faucet long enough to fill the hose, leaving no air bubbles in it. Keeping the free end under water unscrew the faucet end of the hose, covering end of hose with your hand so water cannot run out, and quickly place it lower than your tub. If you wash out-of-doors that will be an easy matter; if in the house, your hose needs to be long enough to carry the water out-of-doors or to some drain lower than your tub. You may have to try more than once at first, for if the air gets into your hose the water will not siphon off. Now don't be shocked, Mrs. Smith, when I advise you to sit down to wash dishes."

"No, Grandma, I came to hear anything you might say. But I tried that once and turned the dishpan of water into my lap. How do you do it?"

"I have a tall stool which is the most important piece of furniture in my kitchen. It is just the right height for my sink. I would as soon think of standing while doing my mending as while preparing vegetables and doing many other things most women stand up to do. The war taught us that our families can live without pie and cake, and, in fact, a great deal more simply than we had thought possible; why not continue the simple life and allow the housekeeper to grow young again? And, last but not least, do not worry. Learn to have your mind at rest even when your body isn't. 'Worry kills more than work.' 'Care, to your coffin adds a nail, no doubt, and every smile so merry draws one out.' 'A merry heart doeth good like a medicine.' Try it."

"Thank you," said Mrs. Smith, as she rose to go, "I confess that I have been like Martha of old, 'cumbered about much serving,' but I mean to take your advice and conserve my strength for my own good and the good of my family."

EXTERMINATING COCKROACHES

If cockroaches are troublesome in the house the following simple remedy will unquestionably destroy great quantities of the pest and keep them in check as effectively as troublesome insect powders and dangerous poisons:

Mix one part of plaster of Paris and three or four parts of flour. Place this dry mixture in a saucer or on a flat piece of wood or tin where roaches are numerous. Nearby place another flat plate containing pure water. Supply a few inclines of wood or cardboard from the floor to the edge of the plate or saucer to give easy access. Float one or two thin pieces of wood on the water so that they will touch the edge of the dish. The insects readily eat the plaster mixture, become thirsty and drink. The water makes the plaster set in the intestines and kills the roach.

Call on it when friends call on you

The next time friends call on you—call on Ghirardelli's! You'll find it equal to *any* occasion. And you'll be apt to say—as many another wise hostess has said:

"It's wonderful—isn't it?—how a cup of Ghirardelli's puts people at ease—helps to make them feel 'comfy' and sociable."

Ghirardelli's—the *original* Ground Chocolate—is not sold in bulk but *in cans only*. In ½ lb., 1 lb. and 3 lb. cans—wherever you do your trading. Look for the Ghirardelli label!

Say "Gear-ar-delly"

Since 1852 D. GHIRARDELLI CO. San Francisco

Ghirardelli's Ground Chocolate

If You Buy GOOD Farm Implements, Why Buy a "Cheap" Piano?

Successful farmers have long ago learned that it pays to buy good tools, implements, machinery, tractors—yes, and good automobiles. In the end they are less expensive than the "cheap" trash which did poor work and which would have had to have been replaced. The same is true with Pianos—a good, dependable Piano which will give satisfactory life-time service cannot be made today to sell now under $300. Anything offered for less is a "near" piano, made to catch the unwary *once*. It has no musical quality of tone—it gives out within a few months—it sounds tinny—the woodwork warps—the keys stick—it won't stay in tune—it is worse than no piano at all.

A good, reliable dealer carries Pianos only of true musical worth—his prices are consistent and his terms of payment are so reasonable that you can buy a good piano just as easily as you can a poor one.

We invite you to call at any of our stores—or write us asking for illustrated catalog and prices.

We are dealers in Steinway and other Pianos, Pianola Pianos, Aeolean Player Pianos, Player Music, etc.

Belgian hares 15.

LIVE STOCK

By F. P. Allen, Bureau of Markets, Los Angeles

Strictly No. 1 steers and cows are steady. Very few straight cars of either good steers or cows reach this market. The medium and common grades of beef cattle are weak. Quite a number of cars of hay and grain fed steers from Southern California are being shipped to Kansas City where good prices are obtainable. Daily quotations from that market indicate that steers weighing over 1150 pounds live weight are very scarce and in active demand.

It does not seem advisable from present indications, to hold either steers or cows for higher prices than the present on this market. Local consumers curtail their purchases of beef when the prices advance.

Hogs continue scarce and especially strictly No. 1 hogs. Some cases exist where prices higher than published quotations are being paid for hogs. The demand for dressed pork, while not active, seems to be sufficient to absorb the entire supply.

Spring lamb receipts are increasing in volume and slight declines are noted in prices being paid the producer.

Fall lambs that are light weight hold firm. Heavier lambs that must be sold in the yearling class are lower.

Ewes are strong to $1.00 cwt., higher under very good demand.

Live stock prices April 9:

Good steers	13.00@13.50
Medium steers	11.00@12.00
Common steers	9.00@10.00
Good cows	11.00@12.00
Medium cows	9.00@10.00
Common cows	6.00@7.50
Hogs No. 1, 175-225 lbs.	17.50@18.00
Hogs No. 2, 250-400 lbs.	16.00@16.50
Hogs, feeders	13.50@14.00

Above prices are for grain fed hogs in carload lots f. o. b. Los Angeles.

Spring lambs, per head	7.50@8.50
Fall Lambs No. 1 55 to 70, cwt.	16.50@17.00
Fall Lambs No. 2, 65 to 80, cwt.	16.00@16.50
Wethers No. 1, cwt.	11.00@12.00
Ewes No. 1, cwt.	9.50@11.00

POTATOES AND ONIONS

These are the actual prices obtained April 8 by Los Angeles wholesalers in their sales to retailers, peddlers, hotels, restaurants, cafeterias, etc. Terms cash on walk.

Demand and movement good. Little change in prices. Stockton, Burbanks, quality generally good; sacked per 100 pounds, extra fancy 3.75@4.00; Idaho Russets, quality and condition fair, 2.85@3.00; rurals, 2.60@2.85; Oregon Burbanks, fy., 3.25@3.50. New stock, homegrown, Red Rose and White Rose, 2.25@2.50 per lug box. Seed stock, White Rose, sacked per 100 lbs., best mostly 2.75@3.00.

Carlots: Demand and movement good, little change in prices. Closing prices Monday—carlot sales to jobbers—Stockton Burbanks sacked per 100 lbs., extra fy., 3.75. Idaho Russets sacked per 100 lbs., 3.00. Rurals sacked per 100 lbs., 2.60. Oregon Burbanks sacked per 100 lbs., 3.00. Washington Netted Gems sacked per 100 lbs., 2.90.

Sweet Potatoes: Lug box best 1.50; sacked 4.50@5.00 per cwt.

Onions: Demand and movement moderate. Little change in prices. Stockton, sacked per 100 lb.; Browns, best from cold storage, 4.25@4.50; White Globes, 11.00@12.00; Homegrown green onions 15 bunch.

The Alfalfa Growers of California, Inc., 525 Central Bldg., Los Angeles, furnishes the following quotations on alfalfa hay. Below are its selling prices to carload purchasers f. o. b. cars Los Angeles:

No. 1 dairy	24.00@25.00
Standard dairy	21.00@22.00
Standard Alfalfa	18.00@19.00

Avery 5-10 H.P. Special Orchard Tractor

Avery Tractors

(Made in Seven Sizes)

An Appeal to Reason

If you have a certain piece of work that can be done by four men in a year's time would you hire eight men and keep them the year around to do this same work? You would not? Then—

If You Own

40 acres or less,—Why invest in a tractor that costs from two to three times as much as the small AVERY to do the same work that you can do with it especially when,—

No Tractor Made

Has a better traction in any kind of soil; Is any easier to handle in operating; Will get any closer under the trees; Has any better material or workmanship in its construction, or has as many real boosters among its users.

Avery Tractors

Are in use in every state in the U. S. and sixty-one foreign countries: Over 700 being in use in California. They are built, sold and guaranteed by the oldest and now the largest manufacturer of tractors in the world—The Avery Co. of Peoria, Ill.

If you will investigate

The AVERY tractor, versus all makes of tractors from a practical dollars and cents standpoint as a user, your own judgment will make you decide to be another of the fast growing large number of satisfied AVERY owners.

Avery Company of the Pacific Coast

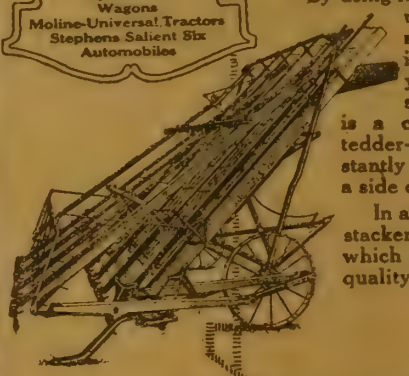
MOLINE HAY TOOLS

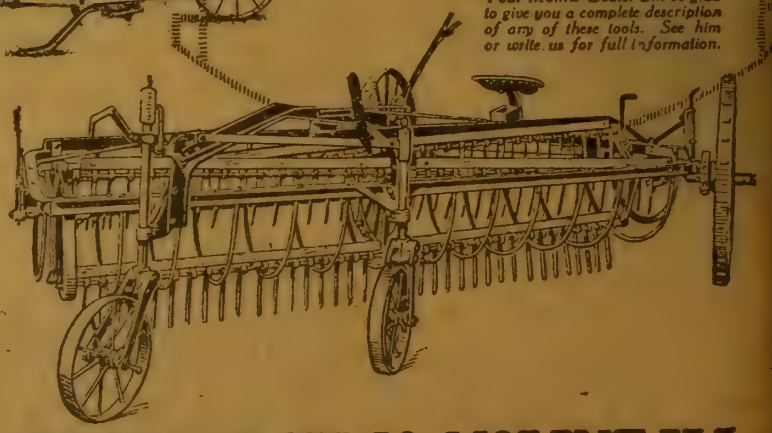
The Moline Line of Implements



Plows (steel and chilled)
Harrows
Planters
Cultivators
Grain Drills
Lime Sowers
Mowers
Hay Rakes
Hay Loaders
Hay Stackers
Grain Binders
Corn Binders
Pitless Scales
Spreaders
Wagons
Moline-Universal Tractors
Stephens Salient Six Automobiles

Use Moline Hay Tools this year and you will accomplish two things—obtain a better grade of hay and save a great deal of time.

Regardless of your hay tool requirements, there is a Moline Haying Tool to give you better and quicker results under all conditions.



Moline Gearless Hay Loader operates entirely without the use of gears, sprockets, chains, rope webs, etc. It gives you less trouble than any loader made, and because of its long, easy 5-ft. stroke, loads hay without breaking or shattering. Loads light swaths or heavy windrows without adjustment. We also build a double cylinder loader known as Moline Loader No. 5, which is preferred in some localities.

By using Moline Side Delivery Rake you can rake your hay into long fluffy windrows where it will cure quickly and in best condition. It will also save your time in loading—we build two styles of side delivery rakes. No. 14 is a combined side delivery rake and tedder—simply shift a lever and it is instantly converted into a tedder. No. 12 is a side delivery rake only.

In addition we build a complete line of stackers, sweep rakes and mowers—all of which uphold the Moline reputation for quality, long life and convenience.

Your Moline Dealer will be glad to give you a complete description of any of these tools. See him or write us for full information.

BEANS

Demand and movement moderate, little change in prices. Carloads f. o. b. usual terms, choice recleaned sacked per 100 lbs. Small Whites 6.75; Large Whites season's average 5.75@6.00; Pinks, season's average 5.50@5.60. Red Mexicans, season's average 5.25@5.50. Cranberry beans, demand slow; season's average 4.75@5.10. Black Eyes, seasons average 3.50@3.90.

GRAIN AND FEEDS

Barley: Feed, 2.30@2.35 cental; shipping, 2.45@2.50.

Oats: Red feed, 2.15@2.25 cental; seed, do, 2.50@2.75; recleaned, 3.00@3.10.

Corn: California yellow, 2.20@2.50 cental; Egyptian, 3.00@3.10 for dry and 2.50@3.00 for rain damaged; Milo maize, 2.75@2.85 for dry and 2.30@2.50 for rain damaged.

Wheat—Following are net weight prices for bulk grain, based on federal standards and grades at San Francisco Bay and Los Angeles terminals:

Hard Wheat—	Per Bushel	Per Central
No. 1	2.20	3.62 2-3
No. 2	2.17	3.61 2-3
No. 3	2.13	3.55
Soft White—		
No. 1	2.18	3.63 1-3
No. 2	2.15	3.58½
No .3	2.11	3.51 2-3
Club and Sonora—		
No. 1	2.16	3.60

For sacked grain add nine cents per bushel of 60 pounds to above price. Deduction of three-fourths of a pound is made for weight of standard grain bags. Wheat grading under No. 3 and mixed or smutty wheat will be purchased according to merit.

Mill Feed (per ton): Bran, 42.00; shorts, 42.00; middlings, 42.00; rolled barley, 48.00@50.00; alfalfa, 32.00@34.00; scratch feed, 3.75 per central.

Bran: 41.00@42.00; shorts, 42.00@43.00; middlings, 50.00@52.00. Rolled barley, 48.00@49.00; alfalfa, 30.00@34.00; scratch feed, 3.50 per cental.

HAY

Under date of April 5 Scott, Magner & Miller says:

Receipts past week 1612 tons. Market is extremely dull. There seems to be somewhat of a scarcity of choice wheat hay in light bales for retail purposes and a few carloads of this quality sold out of all comparison to other grades. The receipts consisted chiefly of the medium and poorer grades which drag along and are placed only with difficulty. There has been some demand for alfalfa from interior points which has caused firm prices to prevail on hay that has not been damaged.

If the present fair weather prevails it is predicted we will have first cutting of alfalfa from the new crop on this market by the end of the present month. Crop conditions are most favorable throughout the hay districts and the present outlook is for large crops.

We quote today wholesale prices in carload lots as appear from dealers' transfers upon the hay market for prices to consumers. Charges of cartage, commission and handling expenses must be added according to conditions.

Fancy Wheat Hay (light 5-wire bl.) .....21.00@25.00
No. 1 Wheat or Wheat and Oat Hay .....17.00@19.00
No. 2 Wheat or Wheat and Oat Hay .....13.00@16.00
Choice Tame Oat Hay .....17.00@19.00
Other Tame Oat Hay.....13.00@16.00
Wild Oat Hay .....12.00@15.00
Barley Hay .....12.00@15.00
Alfalfa Hay .....16.00@20.00
Stock Hay .....12.00@14.00

Citrus Fruit Market

Los Angeles, April 9, 1919.

The orange market is somewhat easier. This is especially notable in auctions. Some sales run as high as $6.00 but the greater bulk are running between $4.00 and $5.00.

The lemon market generally flat, quotations slightly higher. Supply of foreigns somewhat smaller than last year same date.

Shipments

Shipments of citrus fruits to date since November 1, 1918: Southern California, oranges 14,369 cars, lemons 3369, total 17,738; to same date last season, oranges 6823, lemons 1781, total 8604. Central California this season; oranges 3009, lemons 354, total 3363. Last season to same date; oranges 2164, lemons 113, total 2277. Northern California; oranges 244, lemons 2, last year same date 202.

The Hour of the Tractor

is the Economy of Time

If you do not now own a tractor but do own land, you have thought of buying a tractor some day. See the various makes, kinds, styles and sizes actually at work in the ground.

There is no picture book equal to what you will see at the tractor demonstration by all these various machines plowing, harrowing, cultivating and doing other farm work.

Whatever anybody may have told you, whatever you may have read, or whatever conception you may have acquired about tractors, cannot equal seeing them actually doing the work you want them to do on your farm.

A day, three days, a week, spent at the tractor demonstration may save you hundreds or thousands of dollars in money and weeks or months of misunderstanding should you by any mistake buy the wrong kind of tractor for your particular purpose.

See these tractors in action. Consider your own needs, then purchase the tractor accordingly.

Tractor Demonstration

At Sacramento, California,

May 6-11, 1919

It will pay you to come

California Tractor and Implement Association,

77 Tractor and Implement Manufacturers and Dealers

Hotel Land - - - Sacramento.

Take the Case of Milk for Instance

ONE glass may contain pure, sweet and clean milk—the other may be filled with milk that is impure. To all appearances both might contain the same milk.

It's the same with tires—the difference is comparatively slight, to the eye. Yet you can buy Fisk Tires with absolute confidence that you get exactly what you pay for, in mileage, safety and quality.

Why? Because your purchase is backed by the honor and integrity of one of the country's largest manufacturers, whose name has come to stand for quality of the certified Grade A kind. The happy and entirely satisfactory experiences of hundreds of thousands of users of Fisk Tires, in all parts of the world, and under all conceivable road conditions, are that many more reasons for the universal confidence in Fisk.

Fisk Cord Truck Tires fill a long-felt want on the farm. Their great resiliency absorbs the road shocks, keeps the load from shifting and makes faster delivery possible. They make a substantial reduction in fuel and repair bills. The tread is a most important feature—every Fisk Cord Truck Tire is built with the famous Fisk Non-Skid tread, insuring the greatest possible safety and a surer grip of the road for the pull forward. They are the ideal truck tire equipment for the quick, heavy haul.

"There is now a Fisk Tire for every motor vehicle that rolls"

Metal money savers for Farmers

Calco Metal Grain Bin

Does away with the costly jute sack for handling grain. Saves loss of grain from rats, gophers, birds, rain, sun and thieves. Built of Armco galvanized rust-resisting iron. Capacities from 600 bushels to 5450 bushels. Strong and durable. Write for the free booklet, "Calco Grain Bins." It tells you how to save money by handling your grain in bulk.

Model 100

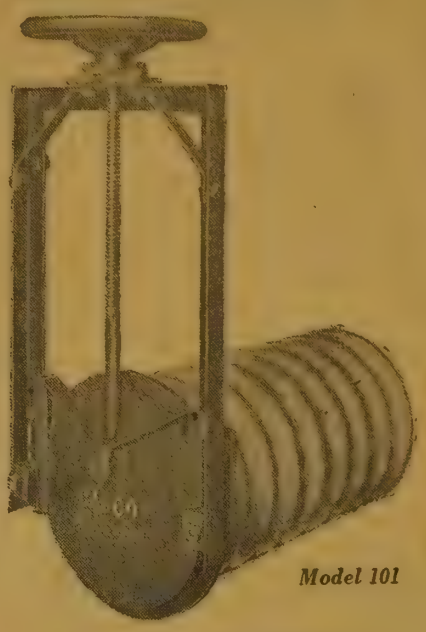
Calco Automatic Drainage Gate

A sensitive, reliable, water-tight Cast Iron Drainage Gate, automatically controlled. It will convert your flooded land into fertile fields. Diameters from 8 to 84 inches. Write for price lists.

Model 252

Calco Automatic Hog Watering Fountain

Constant fresh water, without overflow. Connects to water supply pipe—works automatically. Built of Armco galvanized iron and cast iron. Specifications and prices on price list. Write for one.



Model 150

Armco Iron Lateral Headgates

Easily operated, durable metal gates—diameters from 8 to 36 inches. Hand or screw lift provided with either type of bulkhead. For heads of water up to 6 feet.

Model 153

Model 101

Calco Slide Headgate

Water-tight, Cast Iron Gate for reservoir or levee work. For use under heads of water up to 20 feet. Diameters from 8 to 72 inches—gate frame any height required.

Model 161

Armco Iron Irrigation Gate

An inexpensive, reliable metal irrigation gate. Diameters from 8 to 15 inches. Furnished with or without bulkhead. Write for price list.

Model 244

Calco Hog Troughs

Calco Hog Troughs help you raise healthy hogs. They are sanitary, strong and durable. Built of Armco galvanized iron with cast iron ends. Lengths from 24 to 120 inches. Get our price list

Model 251

Calco Hog Watering Tank

Gives the same service as the Calco Automatic Watering Fountain, where water must be carried or hauled. Easily moved about for your convenience. Strong, durable, sanitary. Get capacities. weights and prices from our price list.

Model 250

Calco Automatic Grain Feeder

Gives plenty of feed—without waste. Clean and sanitary. Bin of galvanized iron, trough of cast iron. Capacities from 2 to 10 bushels. Write for price list.

We manufacture a complete line of irrigation gates and hog specialties. All gates are supplied with any length of Armco Corrugated pipe, when required.

Shorthorn Sale Establishes New Coast Record

THE second spring sale of Shorthorns held at the University Farm, Davis, April 8, under the auspices of the California Shorthorn Breeders' Association established a new record for the Pacific Coast. Forty-two head—21 bulls and 21 females—sold for $27,660, an average of $658.57, which at the time was the highest average ever registered in a sale of beef cattle on the Coast. Included in the sale was the senior yearling bull, California Model, bred, developed and sold by the University of California for the new Coast record of $5500. This youngster was expected to top the sale, but it had not been ventured just how high he might sell. In establishing this record price, he but lived up to the mark set by his two illustrious near relatives. California Favorite, from the same dam, was grand champion steer at Chicago in 1916, and California Marvel a full brother, was grand champion at Portland in 1917 and champion Shorthorn steer at Chicago in 1918. California Model was sired by Sultan Mayflower by Sultan Stamp by Whitehall Sultan and his dam is Glenbrook's Marvel by Glenbrook Marquis, who was a grandson of Whitehall Sultan. At $5500 he became the property of the Conway Ranch Company of Woodland after a spirited bidding contest between many of the leading breeders of the state and Washington. Edward Adrian of San Francisco, who recently purchased the famous Paicines herd of Shorthorns, in which was produced the dam, was the runner up to the final bid.

Well Fed and Good Natured

They were all present at the great live stock week at Davis. From left to right they are: Col. Ben A. Rhoades, ringman; Prof. Gordon H. True; R. J. Kinzer, secretary of the American Hereford Breeders' Association; Col. Fred Reppert, auctioneer; Howard Tilton, Madrone; Alex. McDonald, University Farm; W. R. Madden, secretary of the Pacific Coast Hereford Breeders' Association; John A. Bunting, Mission San Jose; H. H. Gable, president of the coast organization; Charles Rule, Jenner; W. J. Bemmerly, Woodland.

The top price recorded in the female division was paid by Senator Benj. F. Rush of Suisun for Village Pride 2d, a four year old daughter of Villager Omega and a Queen of Beauty dam, consigned by the London Estate. She sold with a bull calf at foot. Senator Rush, who is one of the veteran Shorthorn breeders of the West, made several selections among the choicer bred females, securing among others London's Secret, a daughter of the International champion, Selection, and out of a Secret dam, at $1300. Day & Rothrock, Spokane, Washington, bought Pine Grove Secret 8th, a Canadian bred cow, by Missie Champion out of a Secret dam and consigned by the London Estate for $1250. Wm. Bond of Newark made a top buy in the junior yearling heifer Ormondale Maid 2d, by Golden Goods Jr., consigned by the Ormondale Company of Redwood City, at $1175. J. R. Boyd, St. Helena, made an exceptionally good selection in the white junior yearling heifer, Lodestone Mayflower, a University bred female, at $1000.

Col. Fred Reppert of Decatur, Indiana, who is one of the best known auctioneers in the United States, sold the cattle and was assisted in the ring by Col. Ord L. Leachman of Sacramento.

The complete list of sales follows:

H. M. Elberg, Woodland

Cows

1. Roan Butterfly, calved Jan. 28, 1918, John Elmo Montgomery, Davis, $375.
3. Roan Beauty, calved Nov. 1, 1917, Ralph Todd, Monterey, $350.
6. Roan Belle, calved Jan. 27, 1918, J. W. Salz, Bloomfield, $300.
9. Roselawn Lassie, calved Feb. 10, 1918, Dr. T. T. Purkett, Willows, $325.
12. Peaceful Lady, calved Mar. 4, 1918, Dr. T. T. Purkett, $350.
16. Roan Mary, calved Sept. 16, 1917, J. W. Salz, $300.

Brought $5500

California Model, senior yearling bull, brother of champions and himself the highest priced bull ever sold on the Pacific Coast. Consigned by University of California and purchased by Conway Ranch, Woodland, for $5500.

18. Roselawn B., calved Aug. 11, 1917, E. W. Wiley, Soledad, $535.
20. Roselawn Flower 2d, calved Nov. 21, 1917, E. W. Wiley, $510.
23. Roan Lassie, calved Jan. 8, 1918, Ormondale Co., Redwood City, $440.

Continued on Page 556

Second Hereford Sale Big Success

ONE of the strongest proofs of the growing demand for better cattle in California was furnished in the sale of Hereford bulls and females held at the University Farm, Davis, April 9, under the auspices of the Pacific Coast Hereford Breeders' Association, when 79 head were cashed for an average of $463. That average does not tell the whole story. This was the second sale of Herefords ever held in California, and one does not need to go back many years to a time when it would have been difficult to sell a third that number at auction in this state. Neither does the average price make plain that at least a third of the offering was presented in just ordinary range condition. Neither does the figure show that there were no extremely high tops—the top price was only $2400. As a matter of fact, the sale was highly successful, and while it afforded many bargains, most of the consignors were pleased at the results as the offering was distributed among many new buyers at values that are most conservative and that will prove a benefit to the breed.

Another feature of the sale was the celerity with which the offering was disposed. It has often been remarked that California auction crowds are most deliberate in placing their bids and as a consequence sales often require unusual time, but buyers at this sale placed their appraisal on the offering in short order and bid with spirit from start to finish.

As noted above, the top price was $2400 at which figure the two year old closely bred Anxiety bull, Brave Lad, consigned by J. H. Cazier & Sons of Wells, Nevada, became the property of S. N. Cowell of San Francisco Cowell was the heaviest individual buyer, taking 16 head.

Mother and Daughter

Beneath, granddaughter of Generous, and heifer calf by Harris Standard 2d. Consigned by J. H. Cazier & Sons, Wells, Nevada, and purchased by John A. Bunting, Mission San Jose, for $1000, the top price of the sale.

John A. Bunting of Mission San Jose paid the top price for a female when he bid $1000 for the good Cazier cow Beneath with a heifer calf at foot by Harris Standard 2d. Bunting also got the junior yearling heifer Sonoma Girl 2d, from the Rule consignment, at $850, and the junior yearling Melba Cook, granddaughter of Cuba's Panama, consigned by W. J. Bemmerly, at $470. Benj. Quigley of Linne selected four of the choicer bulls at conservative prices. G. F. Silliman of Watsonville bought 11 head that will be used as a foundation.

A. R. Cutler of Visalia was a heavy buyer of the thinner bulls.

One of the rare bargains of the sale was the five year old bull, Hopeful Prince 2d, consigned by the University of California and purchased by the University of Idaho for $600. This bull was not only a splendid individual, a prize winner himself, but a sire of proven worth. Because of his age he was handicapped by the buyers. Another bull bargain was the Cazier

Agricultural News Notes of the Pacific Coast

Northern California

Butte County will plant 2000 acres of cotton in 1919.

Some of Alameda County's prune orchards are now selling around $1000 an acre.

Glenn County is fighting for an avenue across the valley from Willows to Oroville.

Siskiyou County farmers have been buying tractors. This is made necessary because of shortage of help.

Eldorado County's farm bureau will conduct its fat stock auction at Placerville, April 25. Brass band music and picnic lunch will be featured.

Rice growers of the Sacramento Valley have been enjoined from draining waste water into irrigation ditches.

Eldorado County farm bureau meetings: High School, Monday, April 21; Union, 22; Summit, 24; Oak Hill, 25; Pleasant Valley, 28.

Messrs. Teagarden and Bean of Mt. Vernon, Placer County, report serious injury to fruit buds because of linnets.

Butte County almond growers successfully smudged orchards in time of frost. Present prospects indicate bumper crop.

Modoc County high school boys have organized agricultural clubs, and they are now working for liberal prizes offered for fat pigs.

Napa County farm bureau meetings: Center at Soda Canyon, April 19; Chiles Valley, 22; Union, 23; Rutherford, 24; Pope Valley, 25; Mt. George, 26.

Paradise, Butte County, has been making a strenuous fight against pear blight, and County Commissioner Mills reports practically all blight cleaned up.

Sacramento County's cow testing association's high herd for the month of February is that of A. E. Greene with an average monthly fat of 49.5, 20 cows in a herd.

The Sacramento County farm bureau auction sales makes a charge to each consignor of ten per cent on the first hundred dollars and five per cent on balance of sale.

Glenn County farm bureau meetings: Center at Plaza, Friday, April 18; Willows, 21; Elk Creek, 23; Grapevine, 23; Larkin, 25; directors meeting at Willows, 26.

Alameda district peas are unfavorably affected by cold spring weather and from the earlier pickings there were practically no fancys secured. Later bloom is developing satisfactorily and higher quality shipments will soon be going.

The General Motors Corporation has announced that it will move its Pacific Coast branch to Sacramento. We are not informed whether the Stockton branch which was formerly known as the Samson Sieve-Grip Tractor Company, will maintain its shops there or not.

Glenn County rice growers have asked the state railway commission as to whether water for irrigation of rice lands is vested in land owner or in the land itself. The real question at issue is as to whether the land owner can transfer his water from parcel to parcel and not lose the water right to the original parcel after resting his land.

Central California

Raisin Day April 30.

Terra Bella, Tulare County, has begun its season's irrigation.

Tulare County's olive orchards are proving among her most profitable.

Tulare is hoping for the early location of a large milk condensing plant.

Tulare is discussing live stock and agricultural fair to be held next fall.

Fred Ross of Kings County recently lost his $2000 champion Poland-China boar.

Turlock, Stanislaus County, is to have a $60,000 plant for canning sweet potatoes.

Watsonville, Santa Cruz County, fishermen are now catching three whales a day.

San Joaquin Valley farmers are generally in favor of a large state good roads bond issue.

The Tulare Live Stock Association is building a cattle barn which will accommodate 120 head.

One grower of Calimyrna figs in Fresno County received a return of $50.000 from 40 acres.

A large apiary has been established by the Western Bee Farms Corporation in Santa Cruz County.

Richgrove, Tulare County, plans the construction of a packing house to be ready for next fall's citrus pack.

Farm bureau at Ducor, Tulare County, is considering the organization of a citrus grokers marketing association.

At the farm bureau fat hog auction at Tegner, Merced County, two and a half cars were sold bringing a total of $7237.

The Bomberger dairy auction resulted in good grade milch cows selling as high as $175 and registered Berkshires $110.

Merced County farm bureau meetings: Center at Livingston, April 21; El Nido, 23; Eschscholtzia, 25; Merced Colony, 28; directors meeting, 20.

The Kern Delta irrigation district directors recently met at Bakersfield with farm bureau members and discussed formation of irrigation district.

Fresno pear growers have found winter pears grown in that section exceptionally profitable. They are to a large degree immune from blight in that section.

Bean growers of Stanislaus County are canvassing the bean storage situation and reporting to the bean pool, which has established headquarters at San Francisco.

Fresno reports Raisin Day celebration preparations as nearly perfected; liberal awards will be made for floats and features of the parade which will be held in Fresno City.

The Tulare County Duroc-Jersey Hog Breeders Association has been formed and recently held a meeting and banquet addressed by one of the larger Duroc breeders of the Middle West.

Late rains seriously injured the apricot bloom which was fully opened at time of the storm in Santa Clara Valley. In the warmer foothill sections where buds were fully out there may be almost 100 per cent loss.

The 1919 Kings County fair is to be a hummer according to the resolution of the board of directors at its recent meeting. The dates fixed are September 21-27. Mark Bassett is president of the board of directors and Frank C. Russell is secretary.

Southern California

Riverside County farm bureau membership is 1768.

The new bean pool sold 215 cars of beans in three days last week.

The first planting of Lima beans in Ventura County was on April 10.

A marmalade factory is being built at Sierra Madre, Los Angeles County.

The Coachella Valley, Riverside County, has finished its date harvest.

Weather conditions have been favorable to a serious attack of brown rot.

Southern California lemon storage houses now contain over 2300 carloads of fruit.

Live stock shipments out of the Imperial Valley are showing material increase.

The Citrus Protective League is appealing for revision of freight rates on citrus fruits.

Sales of the lemon property known as the Leffingwell Ranch began on Saturday, the 12th.

Owners of young orange orchards are planning for intercropping so far as possible this year.

Orange County expects to produce two and a half million dollars worth of walnuts this year.

Government Expert Luce is informing Imperial Valley people as to feeding and marketing of poultry.

Imperial Valley asparagus is still selling at 15 to 20 cents a pound in the Los Angeles retail market.

Game wardens have installed a fish ladder in the Sespe Creek at the intake of the Fillmore Irrigation Company's dam.

Imperial Valley's castor bean crop aggregated 68,892 pounds. Government inspector pronounced beans of exceptionally fine quality.

The Alfalfa Growers of California now has a membership of 1250 and an acreage of 43,000. It has members in every alfalfa district of the state.

Bean growers are perfecting their pool and have made a number of sales at prices which will lessen the loss, but which will not cover cost of production.

The San Dimas marmalade plant is now putting up 18,000 pounds of marmalade every day. The plant at Anaheim, Orange County, will soon reach similar capacity.

Imperial Valley is growing a new fodder plant which it calls hegari. The fodder is said to be more satisfactory than milo and the grain more satisfactory than feterita.

California is now growing around 4000 acres of strawberries, a slight increase over the acreage of last year. One thousand of these acres are in Los Angeles County.

Riverside is to have another big cannery, strictly modern and up to date and with capacity for 4000 tons fruit per season. Apricots will be the principal fruit canned.

The San Dimas Lemon Association still has over 200 cars of high grade lemons stored for early summer shipment. The total shipment for the year will total around 1750 cars.

The lettuce shipping season for most of Southern California points has been closed. The Imperial Valley shipped nearly 900 carloads, sent to nearly every state in the Union.

The Coast and General

Utah's winter wheat and range grass are taking on wonderful growth under favorable seasonal conditions.

Eastern quail, known as Bob Whites, have been introduced into several parts of Arizona by the state game warden.

Idaho: Fall grain and fruit wintered well, much spraying and pruning of fruit trees done, buds swelling in all sections, apricots in full bloom.

Nevada reports for the season: Snowfall moderate, water content normal, much plowing done. Alfalfa and spring wheat both growing fine.

The bureau of markets reports Arizona's and California's truck crops as generally in excellent condition with asparagus and peas going forward in large quantities.

The Hay Congress for Arizona met in Phoenix, April 7. A banquet consisting of such viands as alfalfa coffee, alfalfa muffins and other articles of food made of alfalfa, was one of the features.

In spite of the high cost of building material and the anticipated reduction of these costs, building permits for Phoenix, Arizona, were larger in the month of March, 1919, than in the month of March, 1918.

Convicts who have been used in road work throughout Arizona have been returned to the state penitentary and free white labor will be employed in their place until labor conditions will warrant again using convicts.

The receipts of the Arizona state land office for February were $60,000 and for March, approximately $100,000. This revenue is largely from lands that are leased for grazing purposes and for mining and oil development.

Maricopa County, Arizona, will soon vote on a proposition to bond the county for $4,000,000 for the building of hard surfaced roads covering the most important sections of the county. The roads proposed are to total 272½ miles.

The value of farm lands in Canada, both improved and unimproved, with all dwellings and improvements averages $46 per acre. This is as compared with 1917, $44; 1916, $41; 1915, $40, and $1814, $38. British Columbia shows the highestvaluation, $149.

A number of Eastern mills are now trying out American long staple cotton grown in Arizona, and it is reported that several are likely to use it in place of the Sea Island cotton. The last quotations are 55 and 57 cents for first grade Pima and 53 and 54 for fancy Sea Island.

Plans for the proposed bridge across the Colorado at Parker, Arizona, are being completed, and now that the Arizona legislature has appropriated one-third of the cost it is expected that by cooperative agreement between the state of California and the office of federal roads that the bridge will be constructed.

Snow continued to fall in the White Mountains of Arizona up until the last week of March and is reported to be about three feet deep on the average. At an elevation of 9000 feet higher in the mountains, it is still deeper and of course, drifted in many places. High waters in the Black and White Rivers are expected when this snow melts.

Rhode Island Whites

By M. E. Bemis,
Secretary R. I. White Club of America

A Rhode Island
A fine specimen of Rose Comb Rhode Island White Cockerel.

SINCE the publication of the 1919 officials of the Rhode Island White Club in the Cultivator a few weeks ago, I have received several inquiries from California people, asking about the breed which is so many a new one. No doubt readers of the Cultivator who have followed closely the reports of the leading egg laying contests have noticed that the R. I. Whites are usually close to the top in these reports. Reasoning from the evident interest in the breed, I presume that a brief description, together with the history and some of the achievements may be of interest to a goodly number of Cultivator readers.

In January 1888 Alonzo Jacoy of Rhode Island was in the business of producing broilers and used largely Cochins for his producing stock. At this time he picked up two good White Wyandotte cockerels and mated with some of his Cochin females. A few pullets were rather accidentally retained and began laying so early that Mr. Jacoy decided to keep them. They were mated with Cochin males. A few pullets from this mating were kept and proved also remarkable layers, and believing that he had the foundation for a worth while breed, he decided to mate these pullets with a Rose Comb White Leghorn. The resulting progeny were the foundation of the Rhode Island Whites—not a mongrel breed, not a mutation or sport, and not as some have insinuated the culls from White Wyandottes or White Rocks.

The breed as it stands today is the product of a carefully studied blending of well known breeds; not an accident but planned for a purpose, to produce a rapid maturing bird for market and heavy layer, especially in winter. Their blood lines carry three-eighths Cochin; one-eighth White Wyandotte and one-half Rose Comb White Leghorn. In size and shape they resemble the R. I. Reds. They are bred in both single and double or rose comb, and the number of breeders is gradually extending each season. As they originated in 1888, the special matings used to complete the breed being ended in 1890, it will seem that the breed is by no means "new."

The breed has never been boomed. Their entrance into the favor of the poultry public has, like that of the R. I. Reds, been steady, and now breeders may be found in nearly every state in the Union and in Canada and Australia, possibly in other countries.

Breeders of R. I. Whites are not attempting to belittle the merits of any other breed, simply claiming for them quick maturity, excellence as table fowls, splendid laying quality, with the added advantage of pure white plumage. In the show room they attract attention and the admiration of not only practical poultry folk but of poultry fanciers. At the California Poultry Breeders Association Show held in Los Angeles, January 8 to 14, there were 66 R. I. Whites on exhibition, nearly half as many birds as were exhibited by the R. I. Red breeders.

In the egg laying contests the Whites, as we are in the habit of calling them, are making some splendid records; to mention just a few: At the Seventh National Contest at Mountain Grove, Missouri, a pen of R. I. Whites finished second with an average of 245 eggs each. On straight awards at the All Northwest Contest last year R. I. Whites ranked third in pens with an average of 238 eggs each. A R. I. White hen was third in individual production with a record of 280 eggs, but two R. I. Whites-that were trapnested as alternates in one of the pens laid 291 and 282 eggs respectively. The average of all birds in the contest was 171.08 eggs each; the average of the R. I. Whites in the contest was 225.17 eggs each, the best average made by any breed.

Among the records made by the breed so far this season I glean the following facts: At the All Northwest Contest the highest average production for February was made by the R. I. Whites with 19.3 for each bird. Mrs. Koethen in the Cultivator of March 22 comments on the difference between the cost of feeding Leghorns and the other breeds. The cost for February is somewhat less, the feed for Leghorns costing 26.6 and that for the Whites, 31.8. The Leghorns returned 32 cents above feed cost and the Whites 38.8. I am glad that she called attention to this matter of costs for it is a vital one. I presume that five cents a month would just about represent the difference in cost of a White over a Leghorn. This would amount to about 60 cents for the year. We have seen that the average of Whites at this contest last year was higher than for any other breed. If this holds true with the majority of flocks, and I have no reason to doubt that it does, then the only question is whether the advantage of heavier fryers and heavier hens for the market is worth the extra 60 cents a year that it costs to feed a White. Since we must raise some cockerels and some cull pullets in order to raise the necessary pullets to keep up the flock, and must discard some of the old layers, the question of having a bird that brings considerably more on the market is worth considering. At this (the All Northwest) contest for February a R. I. White laid 27 eggs, the highest number laid by any hen during the 28 days of the month; another White tied for third place with 25 eggs. There are 20 birds in the contest that from November 5 to February 28 have laid 84 eggs or more each and two Whites have laid 93 and 86 eggs respectively.

At the egg laying contest, Texas Agricultural College, the average of all pens of five birds each for the month, February 7 to March 6, was 58¼, the average of R. I. White pens in contest was 84. At Storrs, Connecticut, contest the average production of all birds up to March 20 was 26.4, the average of R. I. Whites was 30.4. Those who follow the published reports of this contest notice that the Whites are mentioned nearly every week, in some way, though it is hardly to be expected that among 500 White Leghorns, the 20 R. I. Whites are likely to rank first.

Proving Great Producers
The Rhode Island has proved an attractive American breed. Typical S. C. R. I. White hen.

R. I. Whites started off first at the National Egg Laying Contest at Mountain Grove, Missouri. The November record was 106 eggs for one pen. Only three hens in the contest laid 25 eggs or more and two of these were Whites. For December the Whites laid the highest average for the month, 18.55, the average for all birds in the contest being 12.54. I haven't the figures for January, but the average for February was 18.04 eggs for each bird in the contest and for the Whites 19.15. The leading pen for the four months is the pen of R. I. Whites with a record of 433 eggs, a pen of Buff Orpingtons is second with 416 eggs and another pen of Whites is third with 376 eggs. Of 13 hens that laid 25 or more eggs in the 28 days of February, three were Whites.

The above do not represent all the achievements of the breed by any means, but serve I think to prove that the Whites as a breed have merit. I am making no prophecies as to the future of the breed, but will leave that to the reader's own conclusion.

Breeders of R. I. Whites do not advertise much—they say they don't have to, that the birds sell on their own merits. There are many breeders though, a good number in California. I believe it would pay them to ask more for stock and eggs and advertise more. I am not a poultry fancier, and have no stock or eggs to sell. I keep chickens to furnish the table—and I keep R. I. Whites.

Turkeys From the Shell to the Table

By Mrs. E. G. Anderson

RAISING turkeys is not easy work nor is it apt to be a profitable undertaking unless they can be grown in a locality where grasshoppers and bugs abound or near an alfalfa field, to reduce the cost of food.

The larger range you have the better. If you have a good range, with plenty of green feed, the young turkeys will not require extra feed, after they are three weeks old until time to market them, when they should be fed on corn for two weeks, to fatten and harden the flesh.

Select large, thrifty birds that have not been inbred to breed from. Those hatched in February are preferable, as they are usually stronger and larger than those hatched later in the sea-

I prefer White Holland turkeys where the range is limited, as they stand confinement better than other varieties, and when dressed for market there are no dark spots where the pin feathers have been drawn, as is the case in birds of dark plumage.

A Bunch of White Hollands
The White Holland turkey is not so generally grown as the Bronze but proves a most profitable bird, and California conditions are entirely favorable for it.

The White Holland turkey is a snowy white bird, often weighing from 18 to 20 pounds when eight or nine months old, and from 26 to 30 pounds when a year old.

The tom turkey is apt to be a little quarrelsome, but if he comes after you in a very belligerent manner, remember that he, like all cowards, is only bluffing; face him and he will run.

House your turkeys, allowing them fresh air, without being in a draft. Feed grain and plenty of grit. If liver trouble develops the turkey will sit around and refuse to eat. The head will become pale, the droopings will be watery, and white in color. Sometimes the bird will limp on the right leg. For this trouble, give a liver pill for two successive days, followed each time by a teaspoon of castor oil. Al-

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertisers in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

THIS WEEK'S COVER

The highest priced cow yet sold in California has her photograph on the cover of this issue. Her name is King Hengerveld Honriette. She was consigned to the history making Guaranty Sale held recently at Sacramento at which the prices not only made state records but Coast records. This particular cow was consigned by the Morrises and was purchased for $4000 by E. M. Barry, Jr., of Daggett. This cow has a record of over 30 pounds butter as a senior four year old. The number of dairy cows in California may be decreasing but the high quality of those that are left means ultimately greater production.

TRACTOR DEMONSTRATION

Arrangements are practically completed for the great Sacramento tractor demonstration. Manager O'Neil writes of details being considered which show preparation for a great event. Tractor farming in particular and the use of implements and power on the farm generally will be advanced by this great demonstration.

PHOEBE APPERSON HEARST

One of California's pioneers and most noble of women, Phoebe Apperson Hearst, has passed. She was the widow of the late Senator Hearst, one of California's earliest pioneers and a great factor in the upbuilding and betterment of California. In her passing our state university and other educational and uplifting institutions have lost their best friend.

CHERRIES RIPE

Millard Sharpe of Vacaville writing to the Cultivator under date of April 12 says. "I now have cherries ripe on my ranch." "Back East" they are still wondering as to whether the early bloom of their cherries will be caught by the late frost.

DAIRY COUNCIL

One of the most recent of organizations formed in the hope of benefiting the dairy industry is the California Dairy Council, organized in February and now maintaining permanent offices at 268 Market Street, San Francisco. Its secretary and manager, S. H. Greene, is now engaged in extending the influence of this organization and addressed a number of the larger dairymen and milk handlers and milk distributors in Los Angeles in the produce exchange of that city. This organization has nothing to do with marketing of dairy products but more with the larger affairs of the industry such as legislation and an educational campaign which shall place before all the people facts showing the necessity for liberal support of the dairy industry, also facts showing the importance of milk products in developing a virile, efficient people. This may be accomplished in part through direct display advertising or in part through distribution of McCullom's book which shows the influence for ill of a diet in which dairy products are not a liberal portion. Especially does the association make it its duty to inform the public concerning homogenized or synthetic milk or milk from which 60 or 70 cent butterfat has been extracted and into which to replace the butterfat has been incorporated 15 cent cocoanut oil. The propaganda for the extended use of this "pure vegetable oil" has been most insistent, and while the makers of the product have taken a name in no way indicating that it is a milk counterfeit, neither calling attention to it as a baby food, yet owing to the greater profit to the retailer it is left to him to see that it is introduced to all the homes possible.

DO IT NOW

It is believed that the peace conference will have the terms of peace ready for signatures before the 25th of April. This day has seemed long in coming, especially to mothers and fathers whose boys are still over there, but the boys are coming home more rapidly than ever, and it seems with the nearing of the end of the discussion that a basis which is fairly satisfactory to all the allies has been found. It can hardly prove entirely satisfactory to central powers as it seems they are still maintaining the position of the injured innocents, but so far as announcements have been made of the terms, it seems that even Germany should be entirely content because she is to be called upon to pay an infinitely small proportion of the real damage of the war.

But with American business people, including the farmers, the question still arises how soon will the affairs of the world return to normal conditions. If by "normal" reference is made to conditions as they were before 1919, the best thinkers seem to feel that such a normal condition can never be restored. "Everything must be on a higher cost basis" and with railway employes' wages still advancing it appears that there is some reason for such a claim, but there must ultimately be some shrinking or reduction of prices according to many, and this feeling has been the cause of much hesitancy in large business transactions, but as peace approaches this hesitancy is disappearing.

The farmer who has real need for a tractor or labor saving implements or a new barn or residence should not indefinitely delay the meeting of those needs. The loss from the delay may be far more than the small amount, if any, which may be gained.

The farmer who sells his products as soon as they are ready for the market, the farmer who does things when they need to be done, is generally the most successful.

A bushel of wheat today will buy a much larger proportion of a tractor than it would four years ago. Nearly every other farm product is likewise higher in proportion. If a $2000 tractor may be purchased a year from today for $100 or even $500 less than the same tractor is being purchased today it is probable that the bushel of wheat and other farm products will show an even greater proportionate reduction. For those who are figuring on price reduction must figure on greatest reduction in staple foods, for this is where the strongest attack will be made.

In any case the work that needs to be done, needs to be done. Do it now.

FIRST CROP REPORT

The Cultivator is sending out this week to practically every fruit producing section of the state requests as to condition of fruit trees and outlook so far as may be judged this early for the coming season's crop. It is too early in the season for any very definite estimates but such will be the case for many weeks yet, as we are reminded by the estimates of the last orange crop. Some made investigations of the past season's orange crop as early as June of 1918. Others, and supposedly more careful, delayed making any definite estimate of the season's crop until harvesting was well started, in fact early in January 1919. After these more careful estimates were made a streak of cold made more material changes in those late date prophecies. True, the shorter the time the fewer the emergencies, but meantime contracts are being made.

Everyone having goods to market is benefited by even these early estimates from various sections, so the Cultivator asks every grower of apricots, almonds, apples, cherries, peaches, prunes, pears, or even grapes and smaller fruit, to join other Cultivator readers during the next few weeks and give estimates of crop production and probable output.

NEVER DEFAULTS

"Agriculture taken as a whole is the one unfailing vocation of man because it is a process of nature aided by man's endeavor, and nature never defaults or goes into bankruptcy. Panics may disrupt commerce and popular uprisings may destroy governments, but the earth never fails to produce."

Perhaps, but there is an occasional farmer who looks at the dry season or the cold snap or the grasshopper and remarks: "But sometimes it's done." In fact, he is something like the friend of Charles Dudley Warner who, after Warner had enthusiastically proclaimed: "Blessed be agriculture," remarked: "If you don't get too much of it."

Agriculture is the foundation of practically all manufacturing and all commerce and it should be understood, not overrated.

SWINE BREEDERS HOLD SUCCESSFUL MEETING

ONE of the most successful meetings ever held by the California Swine Breeders' Association was held at the University Farm, Davis, April 10. The meeting convened at 10 o'clock a. m. but before noon it was evident that the afternoon session would require a larger room. In this respect the swine breeders had the same experience as the Shorthorn and Hereford breeders at their sales—the attendance in each case exceeding all expectations.

Dean H. E. Van Norman welcomed the members of the association and after briefly commenting on the work of the University Farm, extended an invitation to the association to make the farm their annual meeting place.

Professor Gordon H. True, head of the animal husbandry division, discussed some of the larger problems of live stock production and pointed out the opportunity that faced the California breeder. True stated that he frankly believed that the natural resources and conditions obtaining in this state were such as to indicate that, if the most was made of the opportunity, California would become a powerful factor in the pure bred live stock world.

In citing instances on which he based his belief True referred to a few of the well known examples of Pacific Coast accomplishment. He recalled the wonderful showing made at the St. Louis World's Fair by Shorthorns exhibited by the Ladd Estate of Washington, the splendid record of the John L. Smith Holsteins at the National Dairy Show. He also referred to the success the University of California had registered at the 1916 and 1918 Internationals, the record of Bullard Bros. sheep at Salt Lake last year, the wonderful dairy production records made in Coast herds, particularly the fact the highest Holstein and Jersey records were now held by Coast cows, the former by California's great cow, Tilly Alcartra, and the latter by the Oregon cow Vive la France. He also recounted the fact that Day & Rothrock of Spokane had the champion Shorthorn bull at the recent Shorthorn Congress Show and sale. In closing, True reminded the breeders that the fact that a Shorthorn bull bred and developed in this state sold for the new Coast record of $5500 was but added proof of what could be done, but he cautioned the breeders that whatever success attended the pure bred live stock business would be dependent upon confidence, integrity and clean methods.

President C. B. Cunningham told of the work the association had accomplished during the past year and outlined the work that should be undertaken this year. Cunningham stated that the time was here when the hog producers needed a big strong organization that could represent their interests with a force, and he pleaded for more active cooperation from the members.

Roy M. Filcher of Corcoran, who has been responsible for much of the success of the various hog marketing associations in the lower San Joaquin, told of the development of the auction plan of selling finished hogs. Filcher stated that the plan had resulted in the producers securing uniformly better prices and had also served to stimulate the production of better hogs. He said that at the present time the California Farm Bureau Marketing Association was holding three sales a week in the San Joaquin Valley, and that during January they marketed $160.000 worth of hogs, and in February $185.000. Filcher declared that a $2,000.000 business was contemplated for 1919.

F. L. Washburn, president of the Western Meat Company, spoke from the packers' side. Washburn stated that the packing interests realized that there must be a closer understanding developed between the producer and the packer and pointed out that the interests of one were dependent on the other. He stated that he had about reached the conclusion that union stock yards at the principal killing centers were needed and would go far toward bringing about a more satisfactory marketing system. He called attention to the recent action of Eastern producers and packers to estab-

Codling Moth Control

STATE Horticultural Commissioner Hecke is sending out the following hints to apple and pear growers regarding control of that pest of apple and pear trees, the codling moth:

Wormy apples and pears cannot be sold legally, except for by-product uses. No grower therefore should allow the codling moth pest to multiply in his orchard. The codling moth can be controlled and heavy losses can be prevented by spraying at the right time, with the right material and in the right way. Observance of the following points will bring about the desired results: Drench the trees with arsenate of lead spray as the petals are falling. In the case of apples, the first application must be made before the calyx lobes have closed, thus preventing the placing of poison in the little cups on the end of the apple. Closing usually takes place within one week or ten days at most, after the blossoms have dropped. Most varieties of pears have open calyces and the same haste is not necessary as in the case of the apple. If spraying is neglected at this time, no amount of spraying later can be made to give anything like as good results.

If the codling moth is a serious pest and occurs in great abundance, more than one application will be necessary. As a rule, three will suffice. The second should be applied from two to three weeks after the first, and the third about nine weeks after the first. In orchards where the infestation is exceptionally bad, still other applications may be necessary.

There are two forms of arsenate of lead, namely a paste and a powdered form. The paste form should be used at the strength of from four to five pounds to one hundred gallons of water when used in making the first application and six pounds to one hundred gallons of water for the second, third and later applications. If powdered arsenate of lead is used, just one-half of the amount of material is necessary, or two to two and one-half pounds to one hundred gallons of water for calyx application and three pounds to one hundred gallons of water for the second, third and later applications.

Spraying at the right time, with the right material and with proper equipment will not be effective unless the work is done thoroughly. Examine the calyx cups when making first application and see if the spray is being placed in 99 per cent of them. It will be surprising how carefully the spray man must operate, if he is to attain a high degree of efficiency. The small fruits point in every direction and, in order to treat all of the calyx cups, the spray must be directed from a great many different angles. If there is any tendency to economize in spraying, it should never be done by sparing the liquid. Four pounds of paste lead arsenate to one hundred gallons of water will do as well for the calyx application as double this amount, which is often used. Reduce the amount of lead arsenate to the minimum, but do not spare the liquid which is applied to the trees and results will be satisfactory.

Culture of the Date

The United States department of agriculture is issuing a 24 page bulletin, "Propagation and Culture of the Date Palm." It is written by Bruce Drummond, Assistant in Arboriculture, Crop Physiology and Breeding Investigations, and well known to Californians because of his thorough study of the date palm and the practical help which he has given to date growers.

This bulletin is intended to furnish growers with definite instructions for the rooting of date offshoots and for their subsequent care in the orchard.

The only thoroughly satisfactory method yet devised for rooting young date offshoots consists in the use of a heavily manured nursery bed covered by a frame or shed so constructed as to give maximum heat and humidity. Water must be applied in ample and regular quantities.

Frequent irrigation and the maintenance of a high degree of soil fertility by the use of manure, mulches, and cover crops are essential to healthy growth and to the production of fruit in paying quantities.

First class dates suitable for market can be produced only on soils in a high condition of fertility and tilth. This condition is most readily maintained on a well drained sandy loam. Heavy soils need special attention to insure the proper penetration of the roots and distribution of water.

Localities where the settling of cold air causes the formation of dew during the ripening period may prove fatal to the more susceptible varieties of fruit.

The pruning of bearing palms should consist merely in the removal of old leaves, up to the fruit stems of the former crop.

Young palms should not be allowed to produce heavy crops of fruit, as this would be done at the expense of offshoot growth.

At the present stage of the industry the production of offshoots of proved varieties is of paramount importance.

Farm Accounting Taught in One-Day Extension Schools

An effective one-day farm-management extension plan has been developed in the corn belt. The farm advisers advertise this work by requesting the men who wish to register for the day to write them immediately. The attendance for any single day is restricted to less than 30 men. The men are kept busy reviewing their farm business records for five or six hours. Those who register come for the purpose of getting all they can from the work. The day's work includes:

A discussion of the principles of farm management and farm accounting to indicate what the day's work will cover; then each man is given a blank account book. A typical record is given to be worked out by the same steps a man must take in keeping a record. The first step is to enter the inventory at the beginning of the year; the next, to enter all cash expenses and receipts. Usual errors found in farm bookkeeping are illustrated, and entries made to show how they may be corrected. The inventory is later entered for the end of the year, taking into account the methods of handling depreciations. The farm account is summarized. The taxable income is determined. The farm account is analyzed to show at what points the organization of the farm can be strengthened. The leader devotes considerable time to an analysis of the farm business and the value of farm records and of cost accounting. Finally each man is assisted in starting his own record book for the new year.

There is evidence that farmers in this area are beginning to appreciate the value of a farm record. Several farmers in Minnesota have written to the extension department commenting upon the work for the past year. The following is a typical letter:

"I got an account book at the short course two years ago and am surprised to find out how much a farmer can learn about his own business by keeping such a simple and easy system of records."

D. A. Gilchrist, representing the United States geological survey, will poison prairie dogs over about a million Arizona acres during this month.

The banks of the Salt River Valley of Arizona have increased their resources more than $3,000,000 since December 31.

Sacramento

Tractor Demonstration May 6 to 11, 1919

Bring the Wife!

Do you realize what a tractor on the farm means to the wife?

It means saving her drudgery. It means fewer men to cook for, shorter hours, less household care.

It means more freedom to give to her children, more time to enjoy life, more relaxation.

To you the tractor on the farm means economy of money, time and effort. It means plowing and cultivating when the soil is in the right condition.

It means solving the labor problem. It means fewer chores, because one tractor saves many horses.

Bring the Wife!

She will be interested in seeing the half a hundred tractors of all makes actually doing the same work they would do on your farm.

There will be many thousands of men, and hundreds who will bring their wives to see the great

Tractor Demonstration

With the Return of
Peace and Prosperity
Plant
Teague Quality
Citrus Trees

With the present demand for food stuffs, the return of peace and normal economic conditions there will be a growing demand for all orchard crops and a corresponding larger demand for nursery trees. Already this return is finding expression in an increased demand for Teague Quality Citrus trees, which leads us to advise intending planters to book their orders early, as the available supply of really good, bud-selected (pedigreed) trees is rather limited. For this reason we invite correspondence. Prices cheerfully furnished.

Control of Wild Morning Glory

By Geo. P. Gray

The early rains of last month followed by warm weather has created a situation in some sections of the state which may prevent the successful application of the spray method for the control of wild morning glory this season. Examination of the condition of the weed has recently been made in sections where the rainfall was five to six inches early in September. Here the rest period of the plant had been broken and the vines are now actively growing. The conditions are much the same as commonly occur in the spring, when the arsenical spray has been found to be ineffective in destroying the roots more than an inch or so below the surface of the ground.

These conditions have not been e countered before in the experiment work and it is impossible to predi whether or not the plants will aga become dormant so that the spra may be effectively applied before t vines have been killed by the frost or before the land has to be plowe First ascertain whether or not t morning glory vines are growing, are dormant. If found to be growin it is thought best not to spray.

It is strongly emphasized that t successful application of the arsenic spray is intimately associated wi the rest period of the wild mornin glory and appears to be dependen upon damp weather during and aft the application.

Trapping Insects With Light

Reviewing the work of Norman Griddle with light traps, A. A. Brock, county horticultural commissioner of Ventura, furnishes the following interesting note concerning similar operations in his county as reported in State Commissioner Hecke's News Letter:

"I remember last summer a Santa Paula man followed up the work at Camarillo and was very much pleased with the results. He put out light traps and kept them going for several nights, but the catches were very small till one morning a heavy fog came in. He was up that morning about four o'clock as he had planned to go away on a vacation trip. On this morning the catch was so great that he decided to postpone his trip. You understand that during the summer months we have these heavy fogs almost nightly. They drift in from the ocean and last till the middle of the forenoon and sometimes longer. So this may account for the number of moths captured by these light traps.

As to the percentage of male and f male captured, I have no check, but believe Mr. Campbell of the Unite States department of agriculture Alhambra made some counts of th moths captured at Camarillo. I a sure there is some very valuable i formation to be had of the number gravid females captured with thes light traps. I, of course, have onl followed the work from a practic standpoint and it seems that the were captured in such numbers as benefit the producer."

In connection with the foregoing, is recalled that Geo. P. Weldon r ports "catches" of as many as 70 moths in a single night at Oxnard wit acetylene light traps. These wer identified by J. E. Graf as largely bein the common cutworm moth, Peridr ma saucia Hubn.

The traps in question were inge ious affairs, the light occupying a pos tion in the raised center of a circul pan containing oil. The abdomens many of the trapped females were di tended with eggs.

Successful Orange Growers Fertiliz Liberally

"The question of fertilization of citrus groves," says J. L. Matthews in the Covina Argus, "is one of vital import to the growers of the state, as there is no fruit tree that gives better returns for liberal fertilization than the orange and the lemon. The rancher must squarely face the fact. If he does not fertilize and fumigate his orchard he cannot grow citrus fruits at a profit.

"The idea that California soils are virgin, of inexhaustible fertility, might be good real estate talk, but not safe to bank on in making oranges pay. The nature of the citrus tree seems to be to overfeed itself in the surrounding soils for a few years when first planted. Especially is this true when there is plenty of expanding room for new roots. After this brief period the tree practically stands still if not fertilized, and its fruit is all of small sizes.

"All record breaking returns of heavy crops have been made on well fertilized orchards. There are many cases where old trees ceased to bear fruit after going a few years without fertilizer. This is more nearly true of old trees than of young trees, and as the orchards grow older they need more fertilizer each year.

"There are some remarkable examples in this valley of good returns from various systems of fertilizing, many of which would pay growers to investigate and put into practice.

"There are within a few miles of Covina some of the most productive orchards in the state of California, due principally to consistent, regular and systematic fertilization and fumigation, covering a period of years. It would be well to watch from year to year the yield and tree conditions in some of the best orchards. A good demonstration is worth a whole lot of theory. On the other hand, there are many orchards that are giving unnecessarily low returns for lack of fertilization or incomplete systems employed.

"Interest and taxes on a valuation of $3000 per acre means that it costing somebody about $4 per tr each year to keep a tree standing idl On the other hand, trees that ar properly fertilized and annually fum gated will net their owners handsom returns on this valuation. Fumigatio and fertilization go hand in hand t achieve financial success in the ci rus business. It is useless to spen large sums on fertilizer unless th grower consistently fumigates, for a one rancher said, 'There is no fertil zer that will successfully grow frui and feed scale at the same time.' It is a noticeable fact that successfu fertilizer salesmen never solicit rancher for business who neglects an of the great essentials in citrus cu ture."

ENTOMOLOGISTS TO MEET WITH CONVENTION

The Pacific Slope branch of th American Association of Economic En tomologists has announced its inten tion to hold the annual meeting a Riverside in connection with the Frui Growers and Farmers convention an the conference of Western Plant Quar antine Officials. This will be an adde attraction and the program will be o especial interest to all county horti cultural commissioners.

PLANT DISEASE AND PEST CONTROL

The University of California colleg of agriculture has issued handbook o plant disease and pest control. It i written by Professors Ralph E. Smith E. O. Essig and Geo. P. Gray. It con tains in condensed form a fund of in formation as to pests infesting prac tically all crops growing in California with information as to application o spray or treatment to give, time o application, etc. The last half of the bulletin is given up to formulas and description of materials.

OLIVE GROWERS WANT OLIVE EXPERIMENTS

The olive growers are asking why ey may not have an experiment sta- on for working out their problems d suggest that the 100 acre orchard wned by the state university at earney is the logical place. The Fig d Olive Journal says:

"Why would it not be logical and acticable to have experimental work rried on at this point, where the cilities for work, together with a ove of olive trees of from two to 20 ars of age, are already available? course, there may be reasons why is could not be done, but we do not ow of these reasons at this writing. "In addition to the Fresno location, ere should be experiments made in number of other sections in the rthern and southern parts of the ate, since the soil and climatic con- tions vary very considerably and us make it necessary to consider ch section by itself. The work of l these substations could be corre- ted, of course, and the whole of the vestigations would combine to make measure of the greatest possible lue to the present and prospective ower of olives."

HOW DATES ARE GROWN

Date palms are propagated either seed or by offshoots. Seed may be anted from the best varieties, but ere is no assurance to the grower at he will get a large percentage commercial dates. The offshoot of e date palm is a bud at the axil of e leaf; hence it is a direct product the growing stem and in variety e same as the parent plant.

The only thoroughly satisfactory ethod yet devised for rooting young te offshoots consists in the use of heavily manured nursery bed with cloth covered frame or shed so con- ructed as to give maximum heat d humidity. Water must be ap- ied in ample and regular quantities. Frequent irrigation and the main- nance of a high degree of soil fer- ity by the use of manure, mulches, d cover crops are essential to althy growth and to the production fruit in paying quantities. First- ass dates suitable for market can produced only on soils in a high ndition of fertility and tilth. This ndition is most readily maintained a well drained sandy loam. Heavy ils need special attention to insure e proper penetration of the roots d distribution of water. Localities here the settling of cold air causes e formation of dew during the rip- ing period may prove fatal to the ore susceptible varieties of fruit.

The pruning of bearing palms ould consist merely in the removal old leaves, up to the fruit stem of e former crop. Young palms should t be allowed to produce heavy ops of fruit, as this would be done the expense of offshoot growth. At e present stage of the industry the oduction of offshoots of proved va- ies is of paramount importance.

FRUIT FLIES RAVAGE GREECE

Two pests which through the efforts California inspection service have en excluded from the state are re- rted as working serious damage in e Mediterranean regions.

In Greece the Mediterranean fruit (Ceratitis capitata Wied) is re- rted by the United States consul Patras as attacking apricots, cit- us, mandarins, nectarines, oranges, ars, peaches and plums among or- ard crops, and eggplant, vegetable rrows, melons and tomatoes among getable crops. Even the lemon, ich in Greece has been immune in past, is attacked. While losses some places ran to 80 per cent of crop, it averaged about 60 per nt for the entire infested district. e olive also has been attacked by olive fly (Dacus oleae Risso) and to December last a loss of 50 per nt was suffered.

n Italy Dr. F. Silvestri is rearing line parasites of the olive fly to set damage in olive groves.

George H. Maxwell, the well known gation engineer, in a recent talk to Rotary Club of Phoenix, declared t the prevention of water waste uld furnish water for more than 00,000 acres of land in Arizona.

McQUAY-NORRIS Superoyl RINGS

A special ring for engines that pump oil. Used in top groove only of pistons to control excess oil, with McQuay-Norris LEAK-PROOF Piston Rings in lower grooves to insure maximum compression and fuel economy.

Stop the Theft of Power

It is not necessary to put up with loss of power and waste of oil and gas. Don't let badly fitting piston rings steal your motor's power and your gasoline. Install a full set of

McQUAY-NORRIS LEAK-PROOF PISTON RINGS

Increase Power—Decrease Carbon Save Gas

By creating uniform pressure on the cylinder walls, McQuay-Norris LEAK-PROOF Piston Rings stop piston ring leakage, increase power, decrease carbon and save fuel and oil.

Wherever you are you can get them to fit any car, truck and tractor. Jobbers and supply houses in over 300 distributing points carry complete stocks of standard sizes and over-sizes, backed by a factory stock of 3,000 unusual sizes. You don't have to wait—the rings are awaiting your order.

Send for Free Booklet

"To Have and to Hold Power"—a simple, clear explanation of piston rings, their construction and operation.

Production of Truck Crops in Los Angeles County

By R. G. Risser, Bureau of Crop Estimates

AMONG the important truck crop counties in California, there are a number, each of which leads in the output of a special crop. Los Angeles County, however, not only leads in the production of certain of these crops, but also in the production of truck crops as a whole. It grows and ships a wider variety and a more continuous supply of truck crops than any other county in the state. Its output of vegetables during the winter season exceeds that of any other California county, yet it is the leading all year round truck crop county of the state as well. It ships the majority of the cars of mixed vegetables rolled from the state and it rolls a larger number of straight cars of green vegetables per year than any of the other counties. It is important as a producer of celery, spinach, peas, root crops, and miscellaneous products, and it leads as a producer of spring potatoes, shipping tomatoes, cauliflower, lettuce, cucumbers, and sometimes cabbage.

Output for 1918

Shipping records for the year 1918 show that the number of cars of vegetables rolled from Los Angeles County during the calendar year were as follows: Mixed vegetables, 3417; potatoes (spring crop), 1857; cauliflower, 1252; lettuce, 1004; celery, 528; tomatoes, 383; cabbage, 340; turnips, 48; carrots, 47; green beans, 18; cucumbers, 9; casabas, 2; squash, 1; total, 8906.

Growing Districts

There are about 100 points in Los Angeles County from which carlots of vegetables originate, potatoes coming from a larger number of loading places than any other truck crop. The many growing districts which are not all entirely distinct are scattered over the county in all directions from the city of Los Angeles. Some of the more important districts are the El Monte district, San Fernando district, Newmark-Bandini district, Norwalk district, Cudahy district, Compton district, Gardena district, San Pedro district, Wilmington district, Lomita district, Sawtelle district, West Adams district, Tropico district, Fruitland district, Santa Fe Springs, and others too numerous to mention. These different districts have differences in climatic and soil conditions which often complicate the situation.

Shipping Seasons

Potatoes are shipped principally from May to August, shipments being heaviest in June and July. Cauliflower is shipped from October to April, shipments being heaviest from December to March. Cabbage is shipped from November to July, shipment being heaviest from March to June. Lettuce is shipped the year around, the heaviest shipments being from November to May. Tomatoes are shipped from June to December, the heaviest shipments being from August to November. Cucumbers are shipped from May to August, the heaviest shipments being in June. Celery is shipped from October to March, the heaviest shipments being from December to February. The shipping seasons for several of these crops are longer in Los Angeles County than in any other portion of the state.

Proposed Law to Regulate Tractor Business in California

By Clarence W. Fletcher

In order to educate, protect, and benefit the rancher and grower in California in the choice of his farm tractor, it is proposed to pass a law placing the handling, dealing in, or manufacture of farm or other power machinery on farm, orchard, grove or ranch under the examination and licensing of a tractor school which would become a part of the board of agriculture. Such a law, if adopted and passed, would prove of great benefit to more than the average farmer.

It is quite well conceded, we take it, that many an owner of land in this state is persuaded to buy a tractor that is shown by the tractor dealer or salesman as "just the thing", a "big saver of time, horsepower and manual labor", whereas the question of the responsibility of either the manufacturer and his so-called "guarantee" or the guarantee by the local dealer and his salesmen, all anxious for their commissions, is one that could and should be taken into serious consideration.

There are many honest, reliable and trustworthy manufacturers located in California and the East, who are offering tractors of reliability and whose representatives do not make statements unwarranted or at variance with the truth.

These statements can be credited, and the interest of such dealers does not stop when once a sale has been made. These efficient organizations have service men who follow up each sale as made; see that the owner of the tractor, or the operator of the tractor, is fully shown and instructed in the working parts of his machine, knows how to properly oil same, has the bearings adjusted where needed, and shows the proper hitch for the different implements the tractor is to draw and the complete understanding of the motor, its speed efficiency, valve and carburetor adjustments and a thorough knowledge of the track bearing principle so necessary to the longest life of the "machinery" horse.

A permanent tractor school for the education of the farmers and users of tractors in this state has been advocated by many. Such a school is of vast benefit, as is shown by the uniformly large attendance at the schools that have been held in Southern California during the past few months. An added appropriation for still further carrying out this work is asked by the state board of education. There has been much controversy over the action of the present tractor school direction in diffusing knowledge chiefly on tractors made in California.

This centering tractor knowledge on California made tractors only is an injustice to those reliable manufacturers of and dealers in efficient tractors made outside of our state. The law of the survival of the fittest should apply. The manufacturer or distributor giving the greatest value, having the most efficient service departments, where complete stock of parts can be had quickly, should in this land of the open door so generously fostered by the great state of California in other commercial lines be welcomed, and out of the state, American made tractors be given at least an equal share of recognition and public approval by our tractor schools and all public gatherings where tractors are being shown or demonstrated.

Glenn County recently held its first fat hog auction.

ESSEX MOTORS DETROIT U.S.A.

Here Is the Secret Why

The Light Weight Car Everyone Is Talking About Does Not Soon Show Wear

The Essex Stays New

The frame of the Essex is as strong as a bridge girder.

Road strains do not affect it in the slightest; consequently, the Essex is free from squeaks and rattles.

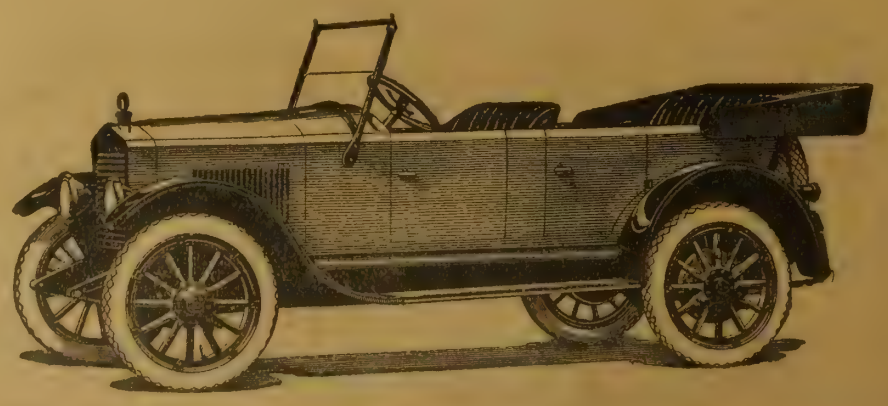
There is no weaving or twisting of the radiator. The Essex remains rigid and firm under the hardest service. Every wearing part is adjustable as well as being well lubricated. The Essex retains its newness.

Just ask any of the tens of thousands who have ridden in the Essex and who are so enthusiastic in their praise of it to describe how substantially and quietly it rolls over even the roughest roads.

How often motorists, particularly those with light weight cars, have driven miles out of their way to avoid a stretch of bad road, because of the torture to themselves and to the car.

But the Essex is affected by no such abuse.

Its spring suspension is unusual and effective. Its construction is so solid that even the roughest cobblestone pavements are passed over with an ease that has created the greatest admiration.



Its friends declare the Essex has no equal in easy riding quality regardless of the size, weight or cost of the car.

When will you take your ride in the Essex?

Any dealer will show you how and why the Essex rides so easily, performs so well and retains its quiet and rigid qualities.

And you will see also a performance of acceleration, speed and power that is comparable only to the highest powered costly cars.

Think how rare these qualities are, even in cars costing much more than the Essex, which in the five-passenger model sells at $1395 f. o. b. Detroit.

AGRICULTURAL CENSUS COMES JANUARY 1, 1920

Uncle Sam has decided to take the fourteenth census on farms January 1, 1920, instead of collecting this data as of April 15, as was done in 1910. The date was changed because farmers ordinarily are very busy with the rush of spring work about the middle of April, also because the April 15 date comes during the midst of the breeding season when the number of young stock is not comparable between northern and southern regions, and finally because the returns on the crops obtained during the winter are more accurate than those obtained later and comparable with the Decem

ber estimates of the bureau of crop estimates.

The United States department of agriculture is assisting the census bureau in making this coming agricultural census as accurate and valuable as possible. To a limited degree the character of the information to be secured will differ from previous enumerations, because of slight changes in the questions which the enumerators will ask farmers. The changes in schedule of questions have been made by a committee composed of L. M. Estabrook, C. W. Thompson, O. E. Baker, L. C. Corbett and F. W. Farley, representing the United States department of agriculture; H. C. Taylor of the University of Wisconsin, recently appointed chief of the office of farm management of the department of agriculture, and G. F. Warren of Cornell, in conference with officials of the census bureau.

The questions include information on the acreage and production of the crops, amount sold or to be sold, live stock classification both by sex and age, acreage of woodland, and the amount of land on farms drained and needing drainage. Special consideration will also be given to matters of land tenure, farm mortgages, land utilization, the amount of land and acreage of crops irrigated, numbers of young live stock sold, purchased, slaughtered, and died on the farms. and quantity of dairy products and wool produced. Owing to the fundamental importance of these statistics, which provide basic information relative to farms and farming in the United States, it is hoped that farmers throughout the country will assist the census enumerators in every way possible in securing accurate, reliable and complete information.

ALFALFA GROWERS ASSOCIATION

The Alfalfa Growers of California, Incorporated, are an association of alfalfa growers organized for the purpose of marketing their product cooperatively. They now have a membership of about 1250 growers representing about 43,000 acres of alfalfa, or an average of about 35 acres of alfalfa to the grower. The membership includes the majority of the growers in practically all the alfalfa growing districts in the state.

The association began marketing December 1, 1918, and since that date has marketed 838 cars of hay. It is going into all the available markets and has recently sold 165 cars for delivery outside of the state. In a number of outside markets they find an active demand for alfalfa at prices remunerative to the growers.

During February it appeared that there would be a considerable quantity of the 1918 crop left in the hands of the members when the new crop came on, but the development of outside markets opened up a new field and it now appears that very little, if any, hay will be in the hands of the growers when the new season opens. This means that the market for new hay will open up strong with a healthy demand and at prices remunerative to the grower.

SOUTHERN CALIFORNIA FAIR AT RIVERSIDE

The Southern California Fair Association has organized for its sixth annual fair to be held at Riversire, October 7-11 inclusive, with the following officers: John L. Bishop, president; F. P. Younglove, vice president; R. T. Sullivan, treasurer; W. W. Van Pelt, secretary-manager. The committees are arranging the premium list which will be ready for distribution at an early date.

CAREY ACT

The United States department of agriculture is issuing Circular 124, "Irrigation Under the Provisions of the Carey Act". California has but little interest in this act, this state never having accepted its terms. Ten other states of the West have, however, and those who are interested in the provisions of the act may get full information by securing this bulletin.

Out of the garden and over the fire. Sweet corn begins to deteriorate almost as soon as it is picked. No one knows its true flavor unless he has seen it come smoking hot to the table within an hour after being pulled from the stalk.

Mr. Farmer

If you grow Raisins, Prunes, Peaches, Pears, Apples, Apricots, Grapes, you need a

SAHARA DRIER.

Every year your losses run into thousands of dollars because of adverse weather conditions—over-ripe fruits, etc. The Sahara Drier guarantees you against such losses. It is the cheapest and best possible insurance for your crops. You cannot afford to take a chance on early rains such as came last Fall.

WINE GRAPES—Many of the California growers are making ready to dry their 1919 crop. We guarantee our machine to do satisfactory work. Our patented process makes this possible. Prices are $650 and $850 for our one-ton-per-day Drier. See our representatives for particulars:

The Tractor and the Law

By James De Camp

THE phenomenal increase in the use of tractors has developed a new variety of pest to compete with the automobile "road hog". The "highway ripper" is of comparatively recent vintage but in the minds of many Californians he is a close cousin to such other nuisances as the chicken thief and the professional pilferer of wayside fruit.

The "highway ripper" makes a practice of driving tractors roughshod over the expensive improved roads that are the very anatomy of our prosperity. When going from one field to another, driving to the repair shop or pulling a tandem of several heavy truckloads, he does not stop to remove studs, flanges, cleats or other devices which are provided to give traction when working in soil but are ruinous and entirely unnecessary on improved "good roads".

This negligence is costly in the extreme. If the operator of such a tractor is a taxpayer part of the burden of the damage will inevitably rebound for a flank attack on his pocketbook. No tractor is made which is not equipped so that a few minutes of work will make it harmless to the road. With some types this operation consists merely in removing the studs from the wheels or unbolting a flange, while others provide bands that can be bolted in place in from five to ten minutes. Laziness is without excuse. The agriculturist who finds one of his employees habitually shredding the highway when moving the machine should discountenance such shiftlessness with formal dismissal.

It has been reported that farmers who are co-owners of the same tractor permit damage done in passing the steel handy man back and forth between his several masters. Warm weather aggravates the nuisance, the softening of the roadbed causing deeper lacerations.

The California vehicle act is very explicit upon this subject and furthermore provides a penalty for those who cause damage to highways. In discussing this matter the vehicle act states, "No tire or any motor vehicle operated on or over any public highway or bridge shall have on its periphery any block, stud, flange, cleat, ridge, bead or any other protuberance of metal or wood which projects beyond the tread or traction surface of the tire."

The same section of the act goes on to except from this provision tractors of the flexible track type, stating, "Traction engines or tractors the propulsive power of which is exerted not through wheels resting upon the ground but by means of a flexible band or chain, known as a movable track, may be operated upon the public highways with transverse corrugations upon the periphery of such movable tracks, on condition that a permit shall first have been obtained . . ."

This matter of securing permits to move tractors over public highways seems to be rather obscure. According to the vehicle act a permit from the department of engineering is necessary before a tractor can sally forth from its own home lot, but no instance of arrest for the lack of such credentials has come to notice. Perhaps the situation is much the same as that regarding some automobile regulations—

However, the state authorities are especially positive regarding the responsibility for damage to highways, the ruling on this matter reading, "—the operator, driver or mover of any vehicle, object or contrivance over a public highway or bridge, shall be jointly and severally responsible for all damages which said highway or bridge may sustain as the result of so operating or driving such vehicle, and the amount of such damages may be recovered in an action at law by the authorities in control of such highway or bridge."

It should be a matter of community pride to admonish the tractor driver who is treating the roads unfairly. Continued abuse will result in a bumpy, rutty condition that will give the district a bad name among automobilists and cause the diversion of travel over other roads and through other towns, this resulting in a corresponding turning aside of trade and publicity.

GAME BIRDS OF CALIFORNIA

"The Game Birds of California" (Contribution from the University of California Museum of Vertebrate Zoology) by Joseph Grinnnell, Harold C. Bryant and Tracy I. Storer: Published by the University of California Press, Berkeley. $6.00 net.

"The Game Birds of California" is a book which adds to one's pride in his own state. Mechanically it is a perfect piece of work which the University Press may take great pride in, and as to the text, plates, and illustrations, they are works of art.

Every one of the 108 native game birds of the state is described in detail, these including the ducks, geese, swans, ibises, cranes, rails, snipes, sandpipers, curlew, plover, quail, grouse, pigeons and doves. The localities in which each is found, and the times of the year when it is found, are designated and its life history and habits are accurately described.

The extensive collections and field notes in the California Museum of Vertebrate Zoology, supplemented by previously published knowledge from the experience of ornithologists throughout the West, have formed the basis for the volume. To this groundwork has been added material obtained from interviews with numerous reliable sportsmen and directly from the fresh field experiences of the authors themselves. The whole is worked into what constitutes a practically complete summary of our knowledge of each of the species down to date. The authors do not claim that the book contains everything that ought to be known about each of the game birds of California; far from it, for more extended observations are certain to provide multitudes of new facts. This book should act as a stimulus for future observers, leading them to add to what is now made common knowledge regarding our game birds.

Introductory chapters are devoted to general subjects, as follows: Decrease of Game and its Causes; Natural Enemies of Game Birds; The Gun Club in California; History of Attempts to Introduce Non-native Game Birds; The Propagation of Game Birds; Legislation Relating to Game Birds in California. The sportsman and nature lover will find much of immediate utility in these general chapters.

The technical matter useful to the special student of birds is found condensed in small type at the head of each discussion. This makes reference to the finer characters of each species easy, and at the same time segregates this formal matter from the more readable text following.

As a sample of what may be expected in the treatment of each species, attention may be called to the chapter on valley quail. Twenty-three pages are utilized in describing the bird, its nest, eggs, distribution, field marks, habits and behavior. Here will be found interesting evidence to show that the male birds act as sentinels. A compilation of data on time of nesting and size of clutch occupies over four pages. It is demonstrated that the valley quail lays more eggs than any other game bird, and under normal conditions suffers corresponding mortality. Means of controlling this mortality are suggested. A discussion of the agricultural bearing, early hunting for the market, and present and probable status of this upland game bird concludes the chapter.

Every school and library in the Western states should contain a copy of this work for reference use. For more and more is the natural history of bird life assuming importance as a subject of general popular culture. Individuals interested in the fascinating field treated in this work should waste no time in securing copies.

MOHAWK TIRES

vs

Slippery Pavements

When you drive on wet, slippery pavement, you want tires that will do their share in holding your car safe—that will carry you where you're going and bring you back safely, without trouble. Mohawks *will*.

And when you turn off the pavement—onto a cobblestone, clay, mud, macadam or fresh cut stone road—you want the same, sure, dependable service. Mohawks give it.

The point is, many tires will stand up well under *favorable* conditions—city pavements, for example. But Mohawk tires yield big mileage—*always*—on good roads or bad.

And the reason is the plain, logical reason that makes any product superior—more and better quality.

In the first place, we don't claim any secret or mysterious processes. We don't find these necessary. We have found, however, that by using only the finest rubber, the toughest Sea Island Cotton for fabric and more generous quantities of material, we can produce a stronger, longer wearing tire.

We believe in expert workmanship—so each Mohawk builder is a veteran and experienced tire maker.

One other important factor—and you have the reason complete. Without watered stock or bonded encumbrance of any kind we are able to operate a healthy plant on a reasonable return, without worry about extra large profits, at the expense of quality.

Think it over. And remember that Mohawk tires actually represent more value for your money.

FORMALDEHYDE VS. BLUESTONE IN SEED TREATMENT

"In certain communities there seems to be some question as to the advisability of using formaldehyde in preference to bluestone in the treatment of small grains to prevent smut", says James Godkin, of the Colorado Agricultural College. "Before continuing this discussion further we would like to have it understood that it is not the intention of the state agricultural college or the United States department of agriculture to create a prejudice against bluestone in favor of formaldehyde in our smut control work. However, we do wish to emphasize some points which we now know to be facts. Formaldehyde has several distinct advantages which would seem to offer sufficient proof to warrant its use in preference to bluestone.

"It is simpler in its application, because it does not need to be dissolved, and the treatment does not need to be followed by an application of lime water to the treated seed to prevent seed injury.

"It is not nearly so apt to injure the grain. On the other hand, bluestone causes injury to the germination and development of seedlings of barley, oats and wheat..

"Any grain treated with formaldehyde which happens to be left over after the treatment may be safely fed to stock after the grain has dried. Grain treated with bluestone is poisonous to stock.

"Formaledhyde is cheaper than bluestone. It is true that formaldehyde costs more per pound than bluestone, but one pound of formaldehyde is equivalent to about eight pounds of bluestone in the treatment of the same amount of grain.

Amounts of formaldehyde to use: 16 ounces (one pint) sufficient for 40 bushels; eight ounces sufficient for 20 bushels; four ounces sufficient for 10 bushels; two ounces sufficient for five bushels.

"Whether you favor formaldehyde or bluestone be sure you treat and use recommended methods in your treatment.

"Treat every season—it pays."

ANNUAL TRACTOR DEMONSTRATION

The second annual tractor demonstration of the California Tractor and Implement Association will be held in Sacramento May 6 to 11.

According to Manager R. M. O'Neill of the association this demonstration without question will be the most successful in point of number and types of tractors, tractor drawn implements and accessories exhibited, and in attendance, of any previously held on the Pacific Coast. Applications for space have been received from leading manufacturers of the East and Canada, and consular representatives of many South American countries have expressed their intention of being present during the week.

These annual demonstrations are now regarded as permanent educational features of the farming industry, affording as they do unusual opportunities for farmer, rancher and orchardist to judge the comparative merits of the different types of tractors and power farming machinery.

On Arden Acres, a tract of 650 acres, will be seen daily in actual demonstration, tractors plowing, harrowing, subsoiling, leveling, checking and pulling various kinds of tractor drawn implements, doing exactly those things that aid in successful and economical farming.

There will also be daily lectures by Professor J. B. Davidson of the University of California and a corps of experts on such vital subjects as More Wheat, Better Wheat, Deep Tillage, Humus in the Soil, Ignition, Lubrication and Care and Upkeep of Tractors.

No admission will be charged, free auto parking space and camping grounds will be provided and an excellent restaurant will be located within the enclosure.

Round trip tickets at one and one-half fare, good to return May 12, will be placed on sale by the Oakland, Antioch and Eastern and Northern Electric Railways.

Increase the Tractor's Value!

Use the tractor disk harrow that can take the place of a plow—gives greater acreage yields under all conditions.

Questions and Answers

ANSWERS BY EDITOR AND STAFF

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Blasting Under Tree

Will you kindly tell me whether it is possible to blast under growing trees without injury to the trees? This of course should have been done when the trees were planted had the orchardist been acquainted with the condition of the deeper soil. If this can be done now will you describe the process in the Cultivator or tell me where I can get correct information?—Subscriber, Chula Vista.

If the question is as to whether it is possible to blast directly under the trees so as to make an opening for deep roots, such procedure would be impracticable. However, trees have often been greatly benefited by placing a charge partly through hardpan layer, say four or five feet from the tree, blasting through the hardpan on one side of the tree, another side the next year, and so on. If the good soil on top of the hardpan is very shallow probably the only safe course would be replanting the orchard, first blasting holes which thoroughly shatter the hardpan some distance from the tree.

Killing Trees

Can you tell me how to kill good sized trees without chopping them down or cutting the bark around in a ring shape at bottom? I have been told to bore a hole into the tree and put arsenic in it. Is this successful? —Subscriber, Los Angeles.

The cheapest and most effective way of killing these trees would be by raking the dirt away from the roots, piling brush around and burning. The boring of holes in the tree and plugging with chemicals probably would not affect the tree very seriously, at least those who have maintained that insect control might possibly be effected by poisoning the sap of the tree by boring hole into the heart and filling with cyanide, have set up the claim that the trees are not injured by this procedure. Of course, one could place about the roots a large quantity of arsenates or caustics or corrosive acids, but this would be extremely expensive and not as effective as the ax.

Slobbers

C. A. MacDonald recommends as a surecure for slobbers in rabbits permanganate of potash. First make a stock solution, one teaspoon of the permanganate to a pint of water, then use a teaspoon of this stock solution to a quart of the drinking water. He assures us it is harmless, cheap, and effective.

Peach Leaf Curl

What is the trouble with the nectarine leaves which I am sending? I have several plum and peach trees that will be blossoming soon and they are situated near the infected tree. Is there danger of them becoming infected through it? If so, how can I prevent it from attacking them? Is there any spray I can use? If so please give me the formula. — Subscriber, Long Beach.

This appears to be only an extreme case of peach leaf curl. It is too late this season to handle it although spraying with weak Bordeaux mixture might prevent, to a small degree, its further spread. Next year in order to prevent occurrence of this trouble spray early in March, or rather before blossom buds begin to swell, with strong Bordeaux: copper sulphate six pounds, quick lime four pounds, water 50 gallons. After the petals have fallen spray with a weak Bordeaux, say two pounds of copper sulphate, two of lime and 50 gallons of water.

Air Puff

I have a hen that fills up with air all over the right side, tight as a drum. I've stuck a knife in her twice, the last two weeks to let the air out. What can be done for her, and where does all that air come from?—J. H. R., Cucamonga.

Your hen has what is called air puff, a trouble due to a wound or abrasion of the lung tissue. Probably she has at some time received a bruise which was not noticed and has developed into this condition. You were right in puncturing the skin, but I hope you were careful not to make much of a wound. The only treatment for these cases is a good nourishing diet, including milk, if possible, a little fresh meat once or twice a week, and a mash rich in protein. Give her all she will eat of the things she likes best.—J. A. K.

The Buckeye Valley west of the Salt River Valley in Arizona is to have a bond election April 29 for the purpose of establishing a drainage system to reclaim about 16,000 acres of land.

California Wonder Corn

The result of ten years' selection. Produces six times as much as common corn. First prize winner at San Francisco Land Show. Quick and big returns from a small investment. All seed produced from corn bearing 5 to 12 ears per stalk. Grows 10 to 16 feet in height, producing enormous crops of very rich ensilage. Choice selected seed for sale at reasonable prices, shelled, on the ear and stalks with all the ears on them. Our illustrated booklet, giving full history and details of this wonderful money-maker, sent free on request.

SWINE BREEDERS MEETING

Continued from Page 540

lish a better understanding between the various interests by the formation of a conference committee of the live stock industry, and he expressed the hope that a similar committee could be organized on the Coast.

One of the most informative addresses heard during the Live Stock Week was delivered by Dean Thomas F. Hunt of the college of agriculture. University of California. Dean Hunt discussed the trend of prices in general and prices affecting the farmers' business in particular.

Hunt declared that prices for farm products were not relatively high at the present time compared to commodity prices in general and he gave it as his opinion that agricultural interests could engage in no more profitable propaganda at the present time than to attempt to keep the consuming public informed as to the actual facts. As a basis for the statement that prices were not high at present Dean Hunt used the Bradstreet price index that is based on the wholesale prices of 96 commodities. Taking prices during the five year prewar period as a basis and giving the index figures a value of 100. the index for 1918 was 210. somewhat below the extreme high point of 215 reached July 1, 1918. In other words the index indicates that compared to the five year prewar period. 1918 prices should have been 210 compared to 100 in order to be on the same basis and register no increase. As a matter of fact land values in 1914 were 111 and in 1918 167; farm wages were 104 in 1914 and 172 in 1918; crops and livestock in 1914 were 106 as compared to 209 in 1918 and articles that farmers commonly buy were 103 in 1914 and 202 in 1918.

The Bradstreet index on March 1. 1919, was given as 193, and Dean Hunt presented a table to show the comparative relationship between March 1 prices on farm products and the index of 193. Wheat was 234, barley 133 (265 in 1918), beans 207, beef cattle 190, hogs 210, sheep 208, wool 273, horses 85, dairy cows 176, butter 161 and poultry 194.

From the above figures it is clear that on March 1, 1919, wheat, beans, hogs, sheep and wool were high; barley really cheap, beef cattle normal, horses very cheap, dairy cows cheap, butter cheap and poultry practically normal—cotton was about normal also.

Dean Hunt would make no prophecy as to what the future held in store—he simply gave the figures quoted for what they were worth. He did however, point out that the Civil War and the world war lasted practically the same period of time, that in each war the inflation of prices was almost identical. He further added that following the close of the Civil War commodities receded two-thirds of their war value during the first six years of peace, and that it took 13 years to reach a normal level. Dean Hunt did not venture to predict that the same trend would occur now. But knowing past movements there may be a basis on which to order one's operations.

Dean Hunt did caution against extending one's credit too far at a period when values were inflated as in many cases this credit would have to be taken up with commodities of much lower value.

In closing Dean Hunt gave it as his opinion that the commodities most in demand by England, France, Italy and Belgium would be wheat, sugar, meats, cotton and wool, and in the case of wheat estimated that those countries would require 500,000,000 bushels more in 1919 than in prewar times. So far as meat is concerned he thought the four countries will be large buyers of packing house products until such a time as their live stock population is rehabilitated.

Dean Hunt remarked that it was generally thought that new countries were the great live stock countries—but Holland had more cattle per 100 acres than any country, Denmark more hogs and Great Britain more sheep—facts that should be remembered by live stock men.

O. M. Plummer, general manager of the Portland International Live Stock Show, spoke on the advantages of live stock shows and the importance of stock yards in the general scheme of marketing.

Dr. F. M. Hayes of the University of California discussed some of the more recent developments made relative to swine diseases.

Professor J. I. Thompson gave the results of a recent hog feeding experiment.

The following officers were elected: President, C. B. Cunningham, Mills; vice president, A. B. Humphrey, Escalon; secretary-treasurer, J. I. Thompson, Davis. The directors are: Wm. Bernstein, Hanford; M. Bassett. Hanford; H. H. Braly, Newbury Park; Frank B. Anderson, Sacramento; Fred M. Johnson, Napa; W. S. Guilford, Willows.

Following the election, short talks were given by A. B. Humphrey, Wm. Bernstein and Fred De Vore of the Duroc Bulletin.

CORNERED THE POLLED HEREFORD MARKET

ONE of the most unusual sales of beef cattle ever held in the West occurred at Sacramento April 9, when 16 head of Polled Herefords were sold for the reported Coast record of $813.

The sale was scheduled as a "Breed Promotion" sale and was sponsored by the American Polled Hereford Association of Des Moines, Iowa. The sale was advertised to be held at the State Fair grounds April 10, but the promoters decided to shove the date ahead and immediately after the Davis sale was over the crowd was taken to Sacramento and the offering sold by lamp light.

A most unusual feature of the sale was the fact that one man, G. W. Emmons of Oakland, took all the females and three of the six bulls sold, at prices that represented the most liberal values. The top of the sale was a heifer calf selling to Emmons at $1500.

W. J. Fulgham of Visalia secured one bull, as did John Morrs of Alamo, M. C. McWhorter and M. B. Church of Grass Valley.

This was the first sale of Polled Herefords ever held in the West and it had been hoped that it would result in a wider distribution of the cattle. Several of the bull buyers wanted heifers but apparently there was no chance unless one paid even more unreasonable prices than prevailed. There is a wide field for the Polled Hereford in California, but the promoters must exercise care in the character of cattle offered and the values placed on them.

The sale was cried by Fred Reppert and B. O. Gammon managed the event.

It is reported that the wool clip for Arizona this season is in better condition and that the yield of wool will be heavier than for many seasons. Shearing is now practically completed in the desert country around the Salt River Valley.

Is There Money in Cattle?

By A. L. Spellmeyer

IS THERE money in cattle? With Western beef steers bringing 13 cents and with fat cows bringing ten, with top Eastern steers climbing to 20 cents, cattle profits should not be doubtful, and the average citizen believes all cattlemen are making vast returns. The men in the business think differently and our bankers do not believe the stock business a mint. There are elements of uncertainty and loss, and most of the large cowmen and beef raisers are men who made their success in earlier days under different conditions.

The majority of these men are hard to convince, and when a graduate from an agricultural college or a university stock man puts forth claims of new range methods, they scout it as theory. When an experiment does prove out they lay it to luck. They laugh at the forest service for their estimates of range by competent grazing experts and call it bunk, forgetting that the forest man estimates a specified number from actual experiements on specified acreage and that a lot of permits are not being grazed on the estimates so made in actual fact, and therefore the range does not improve.

When an extra good year comes and a forest chief takes unto himself and the service credit for range improvement these old fellows smile again, as they know things are not quite on a fact basis and reject all the theories because one man is fallible.

But there is a new system of grazing and handling cattle and there is a way to prevent most of the loss and stabilize production, and it is being appreciated by men in parts of the country who are making a financial success of their outfits and improving their grade of stock.

In the West today the feature which has been operating against better methods and better cattle is lack of permanency. In many of our Western states land is grazed by government permits for one year or longer, subject to cancellation for many reasons and subject to the whims and fancies of individual rangers, inspectors or superintendents. If these men are good men there is a measure of security for the man who does right; if they are not there is irritation and possible loss.

In California the permit question is not so much in evidence as there are many land grants and owned ranches which are fenced and which, with our climate and variation of altitude, give in normal feed years the best grazing all year in the United States for cattle and the greatest possibilities for applying intensive grazing and building up fine herds. But here in California the lack of permanency again enters into the situation. Most of the ranches are not operated by owners but are leased for terms of one to ten years subject to sale.

Many of these leased ranches are held at prices prohibitive to cattle growing, with the mirage in view that they will grow beans, beets or apples. The owner leases for enough to pay taxes and a few cents an acre over, waiting for the time when he will get the big cash. Many of them will never be good for anything but stock, and the sooner the fact is accepted the better, and if they strike oil it won't hurt the grazing.

A few years ago when attending a Middle West cattle convention one of the serious conditions was the rental of farms, operating towards lack of improvement and breeding up of stock. In the West the condition is not much different, except being newer, on a larger scale and without the financial banking support the Middle West man has to help him.

A man who owns a California ranch and rents it because he hasn't the money or don't know how to run cattle, is overlooking a great profit. The range hog, who thinks because he can run 1000 cows on 12,000 acres for ten dollars a head a year that he should run 2000 cows on the same acreage for five dollars a head, is with us in California and in Arizona. He is the kind of man who tries to run three times his government permit number and thinks it smart to cut out cattle, pass them by, and still make it. He is the man who ruins his range, has cattle he can't handle, loses many every winter, and who can never make his steer shipments conform to his calf tallies. In this wonderful West of ours some of these range hogs have left a trail anyone can follow and which will take years of good range supervision to obliterate. It is this kind of man who claims the fancy dividends but can't show it to his banker, who prates against calf stealing but don't return his neighbor's stock, and who thinks a grade bull at $100 good enough, and that five pounds of salt per head per year is plenty for a cow.

This species of man will jeer at the efforts of a neighbor who has made a success and minimize the importance of close control and giving grass a chance to reseed, separation of winter and summer range, cement troughs and clean water at springs, more and better bulls, and all such essentials, which bring calf crops and more flesh. Yet men who own ranches will lease them to this kind of grazing if the bid is a dollar higher.

We have with us also the large owners who have much money and so many holdings they cannot give them consideration and attention. If one ranch proves successful they lay it to chance, nature and kindred causes, rather than to the essentials underlying, not lack of desire to do right, but because their interests are too many to allow them to give close study to the details. Great holdings do not spare grass and build up herds as the smaller ones will.

Without permanency there is no desire to put years of effort into improving cattle and range, as the incentive is lacking. Our packers in their beef prices do not make it worth while, as the fat animal brings the same price if fancy or common. The only gain is greater weight, which hardly compensates for expense in one or two years although it will in time. Our bankers do not accept cattle loans as a recognized staple, and many men cannot get the money for the fine bulls and to make these improvements. Our markets are uncertain and fluctuating, and we have to ship thousands of miles to the nearest open market to meet an uncertain fate at the finish.

There are men in California who are making a big success from cattle and men who run ranches along efficient lines. There are new pure bred ranches starting in great numbers and a growing appreciation of good bulls. Roland Hill is thoroughly modern and runs a fine ranch, breeding and feeding cattle. It is stated that he claims most of his ideas from reading stock journals and he is a practical cow man also and respected when he goes to the ranges to buy. Mayo Newhall runs a fine ranch and makes it pay. The Kern County people under Mr. Jastro produce good cattle and many of them and are getting in fine bulls. Jerome O'Neill during the recent drouth has proven what reserving hay for feed will do to bring a measure of safety and is putting in good bulls, as is being done by that old time cowman, Louis Molten, also. Lewis, the Norwalk tire man, is establishing a model ranch and bringing in registered stock. Many of these men are going into $500 and $1000 bulls and it won't be long before the results will be noticeable.

Cattle ranches are profitable if properly run, and two elements do the talking, one being number of steers shipped and the other production cost. It has been proven and is being shown on some ranches run in districts where drouth loss has been practically eliminated by close control and reserved feed and water development, that 90 per cent calf crops from cows three years and up can be secured and can be raised to yearlings and shipped. It has been proven that with the proper methods and facilities and a fairly safe fenced range that yearlings can be produced at a total cost, interest included, under $18 per head. It has been proven that a few men stood the drouth and bad markets and made good profits on $35 to $40 yearlings when others not operating with such methods lost money. A ranch or two I know of could sell yearlings at $25 per head and make money; the loss is not three per cent on yearlings up, and on some stock one per cent a year. The calf loss is

Known Wherever Horses Are

Doing good service for 34 years, positively guaranteed to satisfy, known all over the world wherever horses are, the name that springs to millions of minds whenever Gall Cure is mentioned—that is what Bickmore's Gall Cure stands for. Successfully used on over one million horses on every continent each year. Satisfaction or money back *guaranteed* everyone. Wonderful for collar and saddle galls, broken skin, rope burns, sore shoulder, mange and other skin diseases, bruises, cuts, chafes, mud scalds, grease heel, chapped teats on cows, and other wounds on horses, cattle, pigs, and poultry. No need to lay the horse up while curing him. Cure the horse while he works. Bickmore's works better if you work the horse. Lawrence Garnett, of Spartansburg, Pa., says, "I have used your Gall Cure and it is certainly good. We used the horse all the time the sore was healing." If your druggist, harness dealer, hardware or general store has not Bickmore's, get it direct from us. Or send 10c for liberal trial sample and very useful Farm Account Book giving helpful pointers to farmers and showing how to keep track of all expenses and receipts. Bickmore's is also now being refined and put out for human use. It is called "Bickmore's XYZ Skin Ointment" and is proving as wonderful for human beings as Bickmore's Gall Cure is for animals. At your dealer's or direct from us. The Bickmore Company, Dept 344 Old Town, Maine.

six per cent between branding and yearlings, something not calculated by all stockmen. These men could have sold in last year's bad market under the prevalent prices at a wholesome profit, but as a matter of fact secured through having better cattle about $5 bonus on a yearling.

Why is it that California ranch owners do not realize possibilities now in the cattle business? It is true we have drouths every few years, but if hay is reserved on most ranches for one year the danger is practically cancelled. If steers are run entirely drouth loss is not to be figured, as they can always be removed and sold or shipped to market with only the possibility of a few dollars per head loss. It must be because these men don't know the cow business and have had very inefficient management, without cow judgment, which is equivalent to horse sense.

The average yearling steer is underpriced on the range today, considering the average expense and ratio of feeder and beef advances. The $40 yearling on any fair fenced California range, properly looked after, and right cattle bought, will weigh exceeding 1000 pounds in two years. Steer loss from anything but anthrax is negligible. One thousand pound feeders are today worth $100 up. A proportion would be fat and bring more weight and more money per pound. The cost of running this steer for two years, interest and all, would probably not be over $30 at the most, perhaps less, $30 profit or $15 to the head per year. What more does any man want on an investment he can cash and get his money out of any time on a month's notice on these California fenced ranges?

Everyone who is figuring on making big money soon is going into steers. They figure they are sure, safe and quick. The high beef price has stimulated cow sale, and with grass the price of ten cents for fat cows is too tempting to pass by, and men are selling these $100 cows all over the country. It can bring but one result and that is breeding stock shortage. It will probably mean replacement to some extent by registered cattle later. We see men all over the country in the mountain districts getting rid of cows and going into steers, yet the cow has advanced since last fall fully $20 per head on most ranges. These men figuring steers are not intending to look more than two years ahead. Then men who are going into breeding stock must look five years or more ahead. Lack of cattle money throughout the country has tended to cause this curtailed production. It is of national interest and conveys a menace for the people who already experience high food cost. The men directing the control of range, cattle and money should bestir themselves to appreciation of existing facts which are becoming more evident daily.

Range can only be fenced through government and state authority, better bulls and improvements can be made only through permanency and with term loans available. Grass must be conserved and allowed rest to reseed. Ranch owners can only be induced to run their own herds instead of leasing by education and proven possibilities. Beef is what we need and must have, and it comes from a cow. The cheapest and most practical way of improving cattle is through good bulls, but it can't be done in a day. The extra hundred pounds on a yearling may be the margin between profit and loss, and the $500 bull will bring that extra weight. There is money in cattle run right, and it takes more brains than brawn to do it. California should have the best cattle in the United States, and when the people awake to the importance of this stock trade we will have markets and money, as we will get them when we demand them, and not before.

The American Association of Importers and Breeders of Belgian Draft Horses has secured Roy E. Graham of Wabash, Indiana, as field man. Secretary Conner of the association writes: "Mr. Graham is a farmer and has been engaged for many years in importing and breeding Belgian draft horses and has had many years' practical experience in all departments of agriculture and live stock breeding, and is thoroughly qualified to aid and advise our Belgian breeders on all questions that may arise in the care and breeding of Belgian draft horses."

What Does It Mean?

This Great Dispersion Sale

McAlister & Sons Famous Herd

— OF —

REGISTERED

Holstein Friesian Cattle?

It means that you, the prospective buyer, can buy cattle at this sale that other breeders refuse to sell at any price.

You can buy cows that have made as high as 35 pounds butter in seven days and 140 pounds in 30 days—that have milked as high as 110 pounds in one day and over 3000 pounds for 30 consecutive days.

You can buy daughters and sons of these great cows sired by the great bull It. At your own price!

You can even buy **IT** at your own price!

Remember the dates, May 21-22 at McAlister & Sons Farm—five miles south of Chino.

On these dates the greatest bargain sale ever in Holstein cattle will be held!

NOTES ON THE HEREFORD SALE

R. J. Kinzer, secretary of the American Hereford Breeders' Association, attended the sale. Kinzer has been one of the biggest factors in putting the Hereford to the front and he was very enthusiastic over the outlook for the breed in this section. Kinzer remarked that all California needed was many more herds of top Herefords—especially more top bulls—and with our natural conditions he saw no reason why the state could not become a leading cource of supply for the best the breed could produce.

Kinzer, Reppert and Moxley, who is president of the parent association, were much impressed with the wonderful abundance of grass that is going to waste here—as Reppert put it: Thousands of acres of the cheapest feed going to waste while breeders in the corn belt are feeding high priced feed, chopping ice from water troughs and digging paths through snow banks. If you can't produce the best cattle here and cheaper than any other place, I don't know where to go."

One lot of females were sold in a bunch, the buyer to take one or all. S. N. Cowell made the high bid and when asked which one he wanted said he would take them all. He made a good buy too. The stuff was thin but feed will bring them out and a nice profit is sure to be registered. A. R. Cutler of Visalia bought bulls on the same wholesale plan.

H. M. Barngrover of Santa Clara made a very attractive consignment from his Veramont herd. It was Barngrover's first sale and while his contributions could have fetched more money he expressed himself as satisfied and served notice on the other breeders to watch his smoke next year! That is the spirit that counts. Barngrover has two of the best bred bulls in California in Patrician 5th, a grandson of Paragon 12th, and Don Woodford 4th.

Charles Rule of Jenner sent a splendid lot of young things that were not only good individuals, but were especially well bred, and his consignment should have fetched more money—almost without exception.

W. J. Bemmerly of Woodland sold a particularly nice lot and was always a bidder on the better things—he was the runner up on the top bull. Bemmerly is a good man for the business. He breeds good cattle, sells good cattle, buys good stuff and furnishes the auctioneer plenty of good natured fun!

H. N. Gable of Esparto, retiring president of the Pacific Coast Hereford Breeders' Association, was not among the consignors but was a good bidder on the top offerings and secured a good cow in Penelope by McCord, a grandson of Beau Brummel, consigned by the Caziers. She calved to the service of Harris Standard 2d the night of the sale.

The Cazier consignment, consisting of 28 head, sold for $17,185, an average of $614. This was not only the largest individual consignment but made the highest average and included the top bull and the top female. The Caziers are building one of the top herds of the West and have recently added Beau Blanchard 76th, counted one of the greatest sons of the noted Beau Blanchard, to their herd at the long price of $10,000.

Clifford B. Harris, Western representative of the noted Hereford firm O. Harris & Sons, Harris, Missouri, attended the sale. Harris says that their May sale will in many respects be the best offering they have ever assembled. They are putting in some of their famous 1918 show string.

M. E. Musgrave, predatory animal inspector for Arizona, recently sold a lot of furs taken from animals killed by his hunters. The lot brought nearly $1000. Among these were the hides of 150 coyotes, 59 bobcats, 39 grey foxes, 18 swifts, 33 skunks, 15 badgers, 3 raccoons, 2 wild dogs and 2 wolves.

The Lawrence-Williams Co., Cleveland, O.

Contagious Abortion

Don't sell the aborters. Clean out the infection. Breeding animals are worth more than ever before. Control of Abortion is doubly necessary.

The Abortion infection causes Barrenness, Retention of Afterbirth and Calf Scours in addition to Abortion. Unless checked it is likely to run through your entire herd.

B-K is a powerful non-poisonous antiseptic—scientifically correct for this work. Used as a douche, it dissolves the slimy albuminous matter in the vagina and uterus, kills the germs, stops discharges and controls the infection. B-K is much more effective than lysol, carbolic acid, Lugol's solution, bichloride of mercury and coal tar disinfectants, all of which tend to coagulate or thicken the albumins.

Contagious Abortion is being successfully controlled in many herds by following our simple plan with B-K. Send for "evidence."

FREE BULLETINS: Send for our valuable bulletin No. 52 on "Contagious Abortion," also "145 Farm Uses" and our "Trial Offer." If your dealer does not have B-K send us his name.

Live Stock News Notes

Shorthorn Heifers

H. L. Murphy of the Brighton Farm herds writes of a bunch of especially fine Shorthorn heifers 16 months old, also of mature cows which he is offering to help build up the herds of Shorthorn lovers. The Murphys have introduced some exceptionaly fine stock from the Middle West during the past two years.

Reds Are Selling

The Ireland Ranch, Owensmouth, reports sales of Ireland's Cherry Defender, fall boar, to E. R. Harris of Van Nuys; Voltaire's Cherry, a herd boar prospect, to W. H. Macomber of Voltaire; Ireland's Lady Jane, a beautiful fall gilt, to J. B. McGee of Whittier.

Will Sell Polands in October

Les McCracken, owner of Wakeen herd of Poland-Chinas, Ripon, announces that he, associated with Hale I. Marsh, Modesto, will hold a sale of bred sows at Modesto during October.

It was McCracken who purchased King's Big Bone Leader at $700 early in the year and these sows will all be bred to this boar.

McCracken is fitting a show herd for this fall and has entered in the Poland-China futurity. Recent sales include a boar to Logan Bros., Paskenta, California; a boar to Geo. Bay, Ojai; boar to Fred Finne, Ukiah, and another to Albert R. Barker, Lathrop.

In addition to his Polands he will also show some Percheron horses.

Buys High Class Poland Boar

Lendorris Ranch, Hanford, property of W. L. Haag & Son, has recently received a young boar from Moore Farms, Gardner, Kansas. The boar was sired by Liberty Bond, owned jointly by Moore Farms and Lester Glover, Grand View, Missouri.

In a letter to Haag, Moore states that they have recently refused a cash offer of $10,000 for Liberty Bond and that Mr. Glover refused $2000 for Hercules Lady, dam of the young boar purchased.

At a recent sale held by Glover sows bred to Liberty Bond averaged $823.

High Prices for Grade Holsteins

In the dispersion sale of grade and pure bred Holsteins held by C. L. Kenestrie at Reedley, April 4, grade cows sold as high as $263.50, and at least two touched the $260 mark. Values ranged from $130 to $263.50.

When grade cows command $263.50 there is ample reason why California dairymen should begin a systematic improvement of their herds, for be it known, the high priced grades are high bred grades—such as only well bred bulls can sire.

Plans a Shorthorn Sale In June

W. M. Carruthers, Shorthorn and Berkshire breeder of Live Oak, has announced that he will probably make a draft sale of select Shorthorns the latter part of June.

In case the sale is made, Carruthers says that he will get together an offering that in point of breeding and individuality will be of a character to attract the best buyers of the West, and will surpass any of his former offerings.

Glide Bid On Top Villager Bull

Thornton S. Glide, Davis, proprietor of the Hillcrest herd of Shorthorns, was, through his agent, Alex McDonald, one of the bidders on several of the best bulls offered in the Weaver and Garden sale at Wapello, Iowa.

Glide was particularly anxious to secure a son of Villager, and had selected the bull that finally topped the sale at $6500. His bidding instructions did not contemplate such a high figure and McDonald could not land him. The Glide herd is one of the pioneer collections of Shorthorns west of the Rocky Mountains, and for a long stretch of years has exerted a powerful influence on the cattle stock of California. Among the herd bulls that have been used are the names of some that have made Shorthorn history on the Coast, and the effort made to purchase the bull referred to was but an effort to place at the head of the herd a bull that would measure up to the Glide standard.

Slocum Arrives With Eastern Durocs

Clayton N. Slocum of the Duroc-Jersey breeding firm, H. P. Slocum & Son, Willows, writes that he has succeeded in purchasing his quota of Eastern Durocs and that he expects to arrive home about April 10. Included in his selections were many boars and gilts representing the best blood lines of the breed that have been selected with particular reference to the needs of this state.

Dolcini Reports Duroc Sales

V. F. Dolcini, Davis, owner of the June Acres herd of Duroc-Jerseys has recently sold a number of bred gilts and boars to Col. Ord L. Leachman of Sacramento. Included in the sale were several daughters of the University boar, Model Col., counted by many to be one of the best boars of the breed.

Dolcini has been one of the heavy winners in the annual futurity shows held at the state fair and he is planning to develop several choice prospects for the coming show. He says that he believes the futurity is one of the best methods for encouraging breeders to properly grow out their young stuff.

Berkshire Breeder Moves to Salida

Homer Hewins, Jr., who for the past few years has been manager of the Maplewoode herds of Berkshires and Holsteins, Calistoga, has recently purchased a farm near Salida and contemplates transferring his operations to that place in the very near future. Hewins served two terms as secretary of the Western Berkshire Congress and at present is a director of that organization.

Barrows To Farm Near Orland

C. E. Barrows, veteran Berkshire breeder and exhibitor, who has been managing the swine department of Meadow View Farm, owned by H. C. Muddux & Son, Sacramento, has but recently resigned to enter business for himself.

Barrows has taken over a place near Orland, where he plans to establish a small herd of high class Berkshires and Jerseys.

Buys Hogs For Philippines

Professor J. I. Thompson, of the animal husbandry division, University Farm, has just completed the purchase of a number of Duroc and Berkshire boars and gilts for shipment to the Philippine Islands. Thompson says that judging from the difficulty he had in locating the required number, California breeders must have experienced a decidedly good year.

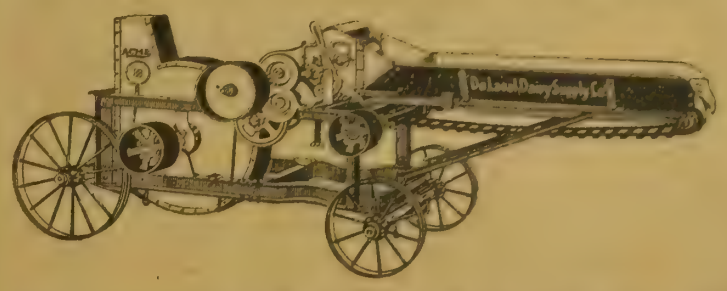
The shipment is being assembled at the University Farm and will be started on the 37-day trip about April 30.

McDonald Back From Cattle Buying Trip

Alex. McDonald, in charge of herds of beef cattle maintained at the University Farm, Davis, has just returned from an extended trip through Iowa and Missouri.

McDonald went East to select an Angus herd bull for the university, and while in the East executed a buying commission for a Hawaiian Island Angus breeder.

McDonald states that all live stock values are on very high levels throughout the corn belt, and that live stock observers do not anticipate a lower range of values for some time to come. According to McDonald the stimulus back of the demand is furnished for the most part, by men just entering the pure bred business in a small way, but who insist on buying the better sorts. He reports that the weather was extremely disagreeable and that in many sections feed is scarce and very high—hay selling for as much as $50 per ton.



TUBBS IN SOUTHERN CALIFORNIA

C. F. Tubbs, manager of the A. L. Tubbs Co., breeders of Yorkshires, Calistoga, is in Southern California recuperating from a severe attack of influenza.

Mr. Tubbs' herd of Yorkshires ranks among the best in the west.

ACME

FEED CUTTERS

The Combined Silo Filler, Feed Chopper and Alfalfa Meal Machine.

The Cylinder Cutter with the durable ALL-STEEL FRAME

A Size for Every Dairy.

WHEN you have finished the work of silo filling you don't have to store the Acme Cutter away until next season.

There is big work for it to do throughout the year—work that is just as important from the standpoint of feed economy as silo filling, and that is the work of chopping your dry hay and making your own alfalfa meal. The Acme will do it all and do it cheaply and well.

The steel frame insures durability and light running. The spiral knives give larger capacity and produce a superior quality of clean-cut ensilage and chopped feed.

Write for complete catalog, circular on economy of chopping dry feed and sample of alfalfa meal.

THE Martin

DITCHER, Grader and Terracer

Makes new ditches; cleans old ones; grades roads; builds dykes and terraces. Cuts alfalfa, Bermuda grass or sweet clover roots from ditch banks, without plowing. Does more work and better work than 100 men with old methods.

Made In Horse and Tractor Sizes

All steel. Reversible. Adjustable. No wheels, cogs or levers. More MARTINS now in actual use than all other farm ditchers combined. Warehouses and distributing points in nearly all Western States. Write for free descriptive catalog and nearest distributing point, together with list of MARTIN users near you.

Butter and Cheese Scoring Contest

By S. L. Denning

THE first scoring of the 1919 California Educational Butter and Cheese Scoring Contest was held on April 3 at the Gustine Creamery in Gustine. In connection with the scoring there was held a buttermakers' judging contest and meeting. On the day following the scoring a dairymen's meeting was held, at which talks were given upon dairy production and the care of milk and cream upon the farm.

Seventeen cubes of butter and two cheese were entered for scoring. T. J. Harris, official inspector of the San Francisco Wholesale Dairy Products Exchange, and Dr. C. L. Roadhouse and S. L. Denning of the University Farm were the judges. Hans Bino of the Petaluma Cooperative Creamery won first place in the butter class with a score of 93¾. John Reber of the Watson Cheese Factory at Bieber was given a score of 92 on his entry of Cheddar cheese and Rufus Steele received a score of 90 on his entry of Jack cheese.

W. R. Underhill of the Globe Dairy Products Company at Newman won first place in the Buttermakers' Judging Contest with a score of 416¾. He will be awarded a butter trier by the California Butter, Cheese and Ice Cream Makers' Association. Mr. Ferry of the Gustine Creamery was second with a score of 378¼ and T. C. Moran of the Oakdale Creamery was third with a score of 367¾.

Butter

The entries which had commercial score of 91 or above are as follows:

Hans Bino, Petaluma Coop., 93¾; A. Wirz, Hollister, 93½; V. Simonsen, San Joaquin Valley Milk Prod. Assn., 93; M. Ferry, Gustine, 92½; C. A. Holm, Moss Rose, 92½; M. Hansen, Western Refrigerator Co., 92; C. A. Johnson, Bodega Coop., 92; Ed Hooper, Hooper Cry., 92; W. A. Peterson, Lucerne Cream and Butter Co., 91½; John Gracia, Northern California Milk Prod. Assn., 91½; A. Madsen, Salinas, 91½; H. Dons, University Farm, 91½.

Cheddar Cheese

John Reber, Watson Cheese Factory, Bieber, 92 per cent.

Jack Cheese

Rufus Steele, Swanton, 90 per cent.

Butter Shows Spring Defects

Among the entries of butter in this scoring contest there were many with a weak, leaky body. At this season of the year the cows are receiving a large amount of green feed, which together with the presence of a large number of fresh cows in the herd gives a very soft fat. If this butterfat is not handled with considerable care during the making process, a poor body will result. Things which cause weak bodies are high churning temperature, warm wash water, butter warming up during working and excessive working. In the spring of the year, moisture is incorporated in butter much easier than during the winter months. Things which tend to increase the moisture content of butter are large churnings, soft fat and working in the presence of free water. Two of these factors are normally present at this time of the year, that is, soft fat and large churnings. The amount of working therefore may be reduced and still secure the proper amount of moisture. Butter should be worked until it has a firm, close, compact body and until the moisture and salt are incorporated and distributed. If the moisture is first worked in, the churn then drained and the butter salted, and the working continued, uniform results may be obtained. When loose moisture is present in the churn during the final working a leaky body often results. The churning temperature should be regulated so that the butter will come in from 45 to 50 minutes and in a firm condition.

An unclean flavor was noticed in several entries. Probably these makers have not yet adjusted themselves to the spring conditions. Very likely some cream which was not of first quality was allowed in the churning. The buttermakers should keep a close check upon the quality of his cream for the dairymen may neglect to properly care for the cream during the first warm days and allow it to spoil. Unclean flavors very often come from cream which is slightly sour. The market is coming more and more to prefer a mild flavored butter made from sweet cream.

Number of Cheese Entries Small

The entries of cheese in the various classes were limited in number although those entered were of good quality. The butter and cheese makers are taking considerable interest in the judging contests and meetings. It is well worth the extra effort on the part of the makers to attend these scorings.

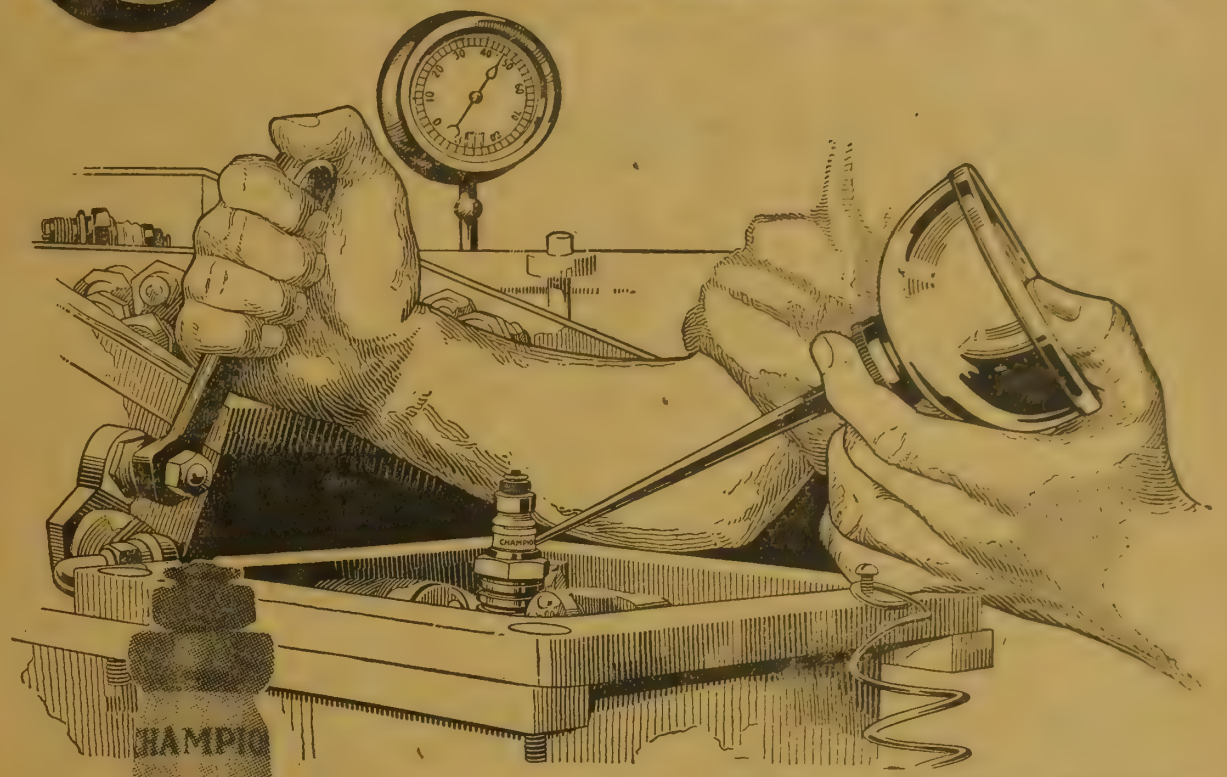
The next scoring will be held during July at the creamery of the Lucerne Cream and Butter Company in Hanford.

Cooperative Marketing of Stock

By Dr. Elwood Mead

Professor Mead prepared the following paper to be read before the California Swine Breeders' Association at their annual meeting at Davis, April 10. Professor Mead has made a careful study of the live stock markets of the world, and in view of the keen interest in better markets for California, his remarks should prove of interest.—Editor.

THE cooperative auctions started in Kern County are a good institution and should be continued and extended. They have a definite educational value. The farmers who gather at these auctions see the difference between well graded, properly prepared stock and irregular lots poorly prepared. It has one feature in other countries that is lacking here and that is some means of extending credit where one farmer buys stock of another. In Australia and I think in most European countries, the auctioneer furnishes the credit. He pays the cash to the seller, takes a part payment from the buyer and his notes for the rest. In Australia he does this by having an understanding with the bank who knows he is responsible and will look after the stock sold until they are paid for. It might be done here by the farm bureaus guaranteeing the paper of their members who buy stock. Where there is free and fair competition in buying, the local or county auction is one of the cheapest methods of selling stock and is a valuable neighborhood institution.



The trouble which confronts stock raisers in this country is the fact that there is not free competition between buyers. Five meat packing firms have steadily extended their domination over the meat industry until they now control the marketing of meat in all great cities. This enables them, where the government does not interfere, to control prices. They have absorbed or are able to dictate to small packers and independent butchers. They own all the important stock yards, the refrigerator car lines, the cold storage warehouses, the cattle loan banks, the trade papers and the canneries. Some of the packers are establishing trade chain stores, butter and cheese factories, tanneries, and other marketing facilities. They not only control markets, but the means by which marketing is carried on. Stock raisers have come to believe that having this monopoly control they used it to manipulate prices in such a way as to bring profit to the buyer and serious or disastrous losses to the seller because live stock once shipped or ready for market must be quickly sold to stop the mounting costs of care and keep.

When the war brought a need for more food and especially for more meat, the stock raiser had to be pro-

tected against these arbitrary changes in price and the remedy used by the government was price fixing. The President gave as a reason for this action "that unjustifiable fluctuations in prices are not merely demoralizing; they inevitably deter adequate production". Price fixing cannot, however, be considered a permanent solution. Its value depends too largely on the fairness and wisdom of the office holder who fixes the price. The fixing of the price of fish in California does not seem to have satisfied either the producer or the consumer. The report of the federal trade commission and the hearings of the senate committee on agriculture last winter both show the gravity of the present situation and have led to the introduction of what is known as the Kendrick bill. It aims to restore competition in buying by taking away from the five big packers the right to own car lines, stock yards and other related industries which makes the competition of small packers impossible. This legislation has one defect. It is not constructive. It does not create of itself any road between the producer and the consumer. This is being done in other countries by a cooperation between the producer and the government under which cooperative associations of stock raisers are loaned money on favorable terms to build and own their own packing plants or the government builds and owns and operates warehouses, stockyards and packing plants, as a means of securing free and fair opportunity for both producer and consumer and to help make the road between them straighter and shorter. These government owned stock yards and slaughter houses at terminal points have been tried long enough to show their value. The one in Edinburgh, Scotland, is nearly 60 years old. It is owned and operated by the city. All fresh meat sold there has to be killed in the city abattoir or pay a tax equal to the killing charge. To that abattoir comes, therefore, all the live stock sold in Edinburgh from the surrounding districts in Scotland. It is not the largest, but is the best equipped slaughter house I was ever in. It is as efficient as a privately owned plan and it does more. It makes competition fair and free and eliminates price fixing. The owner of a carload of hogs will find at the Edinburgh yards buyers for two large meat dealers. They are the Swift and Armour of Scotland. If they offer a satisfactory price, they get the hogs. If they don't the hog raiser has a safe and satisfactory alternative. He turns them over to the municipal authorities to be slaughtered. He pays for this slaughter the same charge per animal as the big dealers do. The rate is the same for one hog as for 10,000 hogs. He gets the same alowance per animal for the offal. After slaughtering his animals are tagged and put in a cold storage warehouse; held there for a given time without charge. He has now the carcasses of a carload of hogs which he can sell to the retail stores. The barrier between the producer and consumer which exists here is removed. It enables the independent butcher to live. He goes into the country and buys stock, has it slaughtered at the municipal abattoir. The big meat companies have to compete with him on fair terms. At the end of 50 years trial of the municipally owned slaughter house, Edinburgh built a new plant intended to meet the needs of the next quarter of a century, as they had no intention of abandoning this system.

I speak of the Edinburgh example because of having visited it, but there are scores of similar plants in England and Scotland. Two-thirds of the slaughter houses in Denmark are owned by cooperative associations of farmers. In Germany, which before the war was the best organized business country in the world, out of 1500 slaughter houses 1000 were municipally owned. Australia is younger than this country, but its stock raisers have had to confront the same menace of monoply control of the meat business that confronts ours. As a result, two of the states, New South Wales and South Australia, have built at their chief seaports state owned slaughter houses and all animals intended for retail sale or for export must be killed at those houses. In Victoria, another Australian state, the state government owns and operates at its two principal seaports cold storage warehouses and it has loaned to cooperative associations of farmers the money with which to build slaughter houses at three different points in the state. This gives to the farmer a square deal. He controls the slaughtering or can sell to slaughter houses controlled by farmers and the government fixes the prices and allots the space at the warehouses where the ships load. Before these cooperative warehouses were built, practically all the hogs slaughtered in Victoria were bought by two private firms and prices went up and down without any regard to the prices in the world's markets, but the grower lost so much from these manipulations that the government had to intervene to protect the live stock industry. In the same way the cold storage warehouses were built

Champion Dependable Spark Plugs

Champion Regular 7/8-18
Price $1.00

Severe Air Test Shows Dependability of Spark Plugs With No. 3450 Insulator

WITH every explosion in the cylinders of your motor, a tremendous pressure is exerted in the compression of the gas by the pistons in the cylinders.

To guard against loss of power and engine efficiency due to leakage at spark plugs, Champion Spark Plugs are submitted to a severe test in our Air Test Machine.

Oil is poured at the point where shell and insulator meet, and a pressure of 140 pounds per square inch of air is forced up through the base of the shell.

The absence of air bubbles means 100% Champion Dependability against leakage.

Our No. 3450 Insulator together with our patented Asbestos Gasket construction withstands a much greater pressure and enables Champion Spark Plugs to come through this test in our machine and *in your engine* with a perfect score.

Buy Champion Spark Plugs now and make sure the name "Champion" is on the Insulator.

There is a Champion Spark Plug for *every* type of motor car, motor truck, tractor, motorcycle and stationary engine.

Avery 5-10 H.P. Special Orchard Tractor

Avery Tractors

(Made in Seven Sizes)

An Appeal to Reason

If you have a certain piece of work that can be done by four men in a year's time would you hire eight men and keep them the year around to do this same work? You would not? Then—

If You Own

40 acres or less,—Why invest in a tractor that costs from two to three times as much as the small AVERY to do the same work that you can do with it especially when,—

No Tractor Made

Has a better traction in any kind of soil; Is any easier to handle in operating; Will get any closer under the trees; Has any better material or workmanship in its construction, or has as many real boosters among its useps.

Avery Tractors

Are in use in every state in the U. S. and sixty-one foreign countries: Over 700 being in use in California. They are built, sold and guaranteed by the oldest and now the largest manufacturer of tractors in the world—The Avery Co. of Peoria, Ill.

If you will investigate

The AVERY tractor, versus all makes of tractors from a practical dollars and cents standpoint as a user, your own judgment will make you decide to be another of the fast growing large number of satisfied AVERY owners.

up by the government to protect the independent dairyman from being robbed and ruined by bringing the control of privately owned warehouses which had to be used in shipping the surplus abroad.

I believe the remedy for monopoly control and for removing the barriers between producer and consumer which have proven successful elsewhere ought to be seriously studied here, not because they are more efficient but because they are more democratic. An autocratic government may be efficient and not desirable. The same is true of an autocratic control of any industry or business.

FARM BUREAU CONFERENCE VISITS ELKHORN FARM

On Thursday, March 27, a party numbering about 150, made up of the state farm advisers, their assistants, and farmers visited Elkhorn Farm in order to inspect the pure bred Ayrshire herd owned by J. Henry Meyer. Professor Gordon H. True, head of the animal husbandry department of the University of California, who was visiting the farm at the time, gave a short talk to the men on Ayrshires. He began by mentioning Finlayston, the greatest bull of the breed, having 99 A. R. records to his credit, whose three most representative daughters, Rena Ross 3rd, member of the famous Rena Ross family, having a record as a junior four-year-old of 16,114 pounds milk and 804 pounds of butter, test 4.24 per cent fat, Polly Puss 3rd, having a senior four-year-old record of 13,194 pounds of milk and 612 pounds of butter, test 3.98 per cent fat, and Curfew Bell 3rd with a two-year-old record of 9839 pounds of milk and 512 pounds butter, test 4.42 per cent fat, were led out for inspection. Next Baron's Best of Bargenoch, having 14 daughters in Advanced Registry was taken up; among his daughters shown was Thistledown Hobsland 3rd, a handsome cow, with a record of 8187 pounds of milk and 328 pounds of butter fat at three years of age. Then daughters of Substantial of Highland, the best bred bull for milk production in America today were exhibited, and finally daughters of Beuchan Peter Pan were shown. The outstanding young herd sire, Holehouse Secretary, just imported from Scotland, whose six nearest dams on his dam's side have records of over 11,000 pounds of milk was also most favorably commented upon. After viewing the animals the party was given the opportunity to sample Ayrshire milk and to note its excellent quality.

STATE CHAMPION JERSEY ON PICNIC DAY AT DAVIS

Interested Jap's Santa, the state champion Jersey milk cow, will be shown to the public at the University of California Farm at Davis on Picnic Day, April 26, according to a recent announcement of Dean Thomas Forsyth Hunt. Other dairy cattle of statewide importance will also be shown at the farm.

Last year Interested Jap's Santa produced 805.7 pounds butter fat, and 13,308.5 pounds of milk. This year for nine months she has given 724 pounds of butter fat, and 12,000 pounds of milk. Professor C. V. Castle, in charge of the experiment, expects her to make over 900 pounds of fat for the 365-day period of the test.

NEW YORK DAIRY SHOW

Official exhibits by the states of New York, Vermont, Connecticut, New Jersey, Pennsylvania and others will be among the features of the National Milk and Dairy Farm Exposition which is to take place in the 71st Regiment Armory, New York City, during the week of April 21. At this time also will be held a series of conventions at which farmers, dairymen and others will discuss present milk production and distribution conditions. This is the second year that the exposition and convention is to be held. Last May it was staged in Grand Central Palace which is unavailable this year because of its being used as an army hospital.

HEREFORD BREEDERS ELECT OFFICERS

In connection with the annual sale held at the University Farm, Davis, April 9, under their auspices, the Pacific Coast Hereford Breeders held their annual meeting and elected the following officers for the ensuing year: J. I. Cazier, Wells, Nevada, president; H. M. Barngrover, Santa Clara, vice president, and John A. Bunting, Mission San Jose, secretary. The retiring officers were H. H. Gable, Esparto, president; W. D. Duke, Likely, vice president, and W. R. Madden, Dixon, secretary.

SAN CLEMENTE QUARANTINE

The island of San Clemente on May 1, 1919, will be placed under federal quarantine to prevent the spread to the mainland of sheep scabies. The disease recently was found to exist among sheep on the island. Under the quarantine sheep may be moved from the island to any state other than California, only in accordance with the federal regulations designed to prevent the spread of the infection.

H. M. Barngrover of Santa Clara reports sale of ten head of Hereford heifers to the Evans Brothers of Nevada. Also a fine young bull to Mr. Hoy of Siskiyou County, and six young bulls to the A. Brown Company of Kernville.

A. M. Sanborn, who has an olive orchard in the Poplar district of Tulare County, grew a successful crop of cotton between his young olive trees the past year. Mr. Sanborn reports returns of over $400 per acre from his cotton.

Big Handlers of Big Live Stock

Prominent live stock men at Davis during the big live stock week. From left to right: O. M. Plummer, manager of the Portland Show; Senator Benj. F. Rush, veteran Shorthorn breeder; F. L. Washburn of the Western Meat Company; T. H. Ramsay, banker-stockman of Red Bluff and member of State Board of Agriculture; Chas M. Paine, secretary of the State Board of Argriculture.

SECOND HEREFORD SALE

Continued from Page 537

bull, Mystic Debonair, purchased by W. D. Duke of Likely for $700. He suffered the same handicap as the University entry.

The sale attracted buyers from a wide territory and was under the efficient management of C. L. Hughes of the California Breeders' Sales and Pedigree Company. Col. Fred Reppert, the nationally known Hereford auctioneer from Decatur, Indiana, set the values and Col. Ben A. Rhoades, assisted by Col. Ord L. Leachman, worked the ring side.

The complete list of sales follows:

John H. Cazier & Sons, Wells, Nevada

1. Lorna Doone 7th, calved Dec. 15, 1916, and B. C. S. N. Cowell, San Francisco, $400.
2. Rose Berry, calved Oct. 18, 1916, and B. C. Peter E. Fink, Reedley, $510.
3. Duchess, calved Dec. 9, 1916. Peter E. Fink, $475.
4. Beth, calved Oct. 17, 1916, Alex Brown, Walnut Grove, $400.
5. Bebe, S. N. Cowell, $425.
6. Chance, calved Nov. 18, 1916, R. Bass, Standish, $400.
6. Mabel, calved Sept. 29, 1916, and B. C., G. F. Silliman, Watsonville, $550.
8. Thelma, calved Oct. 7, 1916, G. F. Silliman, $410.
9. Wildeyes 6th, calved July 2, 1916, G. F. Silliman, $550.
10. Penelope, calved May 25, 1911, H. H. Gable, Esparto, $500.

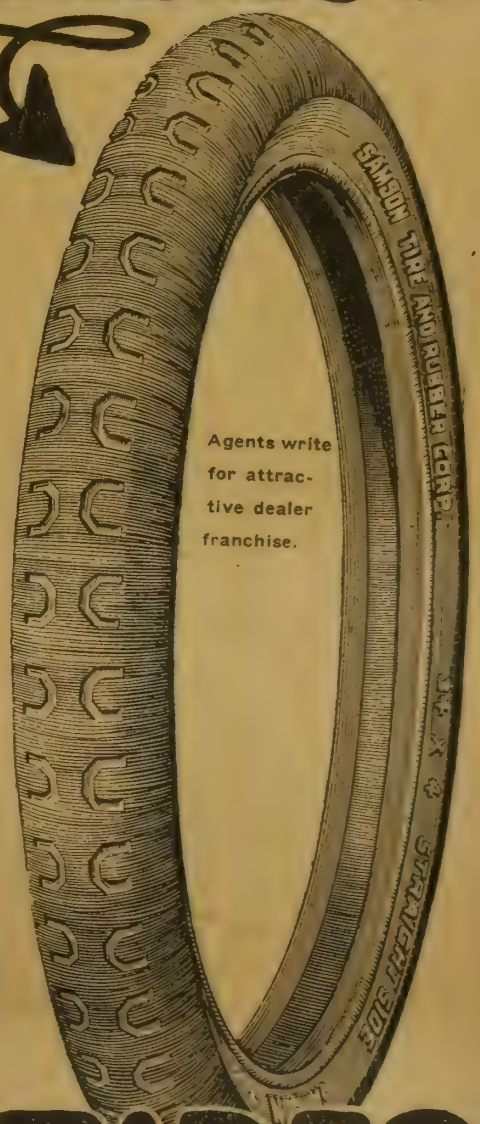
Perfect balance



BALANCED ROCK
GARDEN OF THE GODS
COLORADO

The famous "Balanced Rock" in the Garden of the Gods is one of the most notable natural demonstrations of the law of balance in existence. We use this picture merely to emphasize the fact that Samson Tires are also **perfectly balanced.** The materials used are so "equalized" in their emplacement that each tire is **universally strong.** There can be no weak parts. Everything is absolutely perfect balance.

And this is why Samson Tires last longer and ride easier than hap-hazard products. It pays "all ways" to buy perfectly balanced tires. Ask any Samson user.

Samson Tire & Rubber Corporation,
Compton, California.
Channel Commercial Company,
916 East First Street, Los Angeles.
Tillman & Bendel,

TURKEYS FROM SHELL TO TABLE

Continued from Page 539

low ten hens to one tom for thrifty birds. Keep the house where they roost clean and free from vermin. Coal oil on the roosts is a good exterminator of insect pests.

Sprouted barley: Have seven boxes, about four feet square, and nine inches deep. Bore holes in the bottom for drainage, fill them with barley, and turn water over the grain twice daily. When well sprouted there will be one box for each day.

When the laying season begins, watch your hens carefully as they will invariably steal their nests out in the weeds or brush, and snakes, dogs or skunks may destroy them. The eggs should be brought in the house each evening and should be kept at an even temperature, being careful not to get grease on them or anything that will close the pores in the egg and cause the germ to die. The turkey hen will lay twice, usually from 18 to 25 eggs each time. Many poultry raisers set the first eggs under hens, so the turkey hen will lay soon again, in order to have early turkeys.

Turkey hens are good sitters, and if kept free from mites will seldom leave their nests. It is almost impossible to break one from sitting She will sit just as contentedly upon a china egg or an old door knob as upon a nest of eggs. The bodily heat of a turkey hen when sitting is about two degrees warmer than that of a chicken hen, and they usually will hatch eggs 24 hours sooner than the chicken hen does.

When your turkey hen wants to sit, get a large box, that is high enough for her to stand up in. Loosen one of the top boards so you can put your hand in to give her fresh water and food or fix the eggs if need be, but this is seldom necessary for the hen usually understands her business better than we do. In one corner of the box scoop out a hollow for a nest, lining it well with straw and put in about 20 eggs, with the date of sitting on each one in order to avoid confusion if you should have to change the eggs.

Put a can of water and one of food in the box where she can reach it. Place a coop in front of the slide door that you have cut in the box, so you can let her out to exercise after a day or two, also to prevent the soiling of the eggs.

In the evening, when you catch the hen, taking care not to alarm her, place her on the nest, keeping your hand upon her back until she is well settled on it. Unless the hen is very gentle it is best not to disturb her, for she might crush the eggs by jumping on them.

In about 27 days after setting the hen, remove the can of water from the box, as the little turkeys will hatch on the 28th and may drown by getting into the water.

Do not remove nor feed the young turkeys for from 24 to 36 hours. Nature has provided nourishment for them for that length of time. If they are fed too soon they may have indigestion, in which case they will seem to grow smaller until they die.

When you go to remove them from the nest and put into a box with the bottom covered with clean straw, have a cup by you with a tablespoon of coal oil in it and put some on the hen's head, a little under each wing, and a few drops at the root of her tail. As you lift each little turkey out, dip your finger into the oil and serve them in the same way, putting on just the amount that sticks to your finger.

In one corner of the coop place a box about three or four inches high and a foot square. Remove one side of the box and put coarse wire netting over it. The little ones will soon learn to run in there to eat the food you place in it. If you do not arrange something like this the mother hen will eat it all herself.

If you do not have a drinking fountain to hold the water for them, an old cup will do, if you put a rock into it large enough to keep them from getting into it. Their first meal should be a hard boiled egg chopped up with the shells and mixed with curd that has been made from well clabbered milk and cooked just long enough to make crumble. Sprinkle black pepper over it. This will prevent diarrhoea and is also heating. Give them a little fine gravel with their food. Feed them every three hours until they are two weeks old. The second day after you take them off begin to give them a little chopped onion tops or mustard leaves in their food. When ten days' old, give them a little boiled wheat or cracked barley with the curd. The eggs can be dispensed with after the fourth day, but it would be better to feed the egg for a week.

In two weeks they can be turned on the range with the mother hen after the grass is dry in the morning, and if the weather is warm. Dampness is fatal to little turkeys, yet, as they have the least sense of any animated thing, if you do not watch them in showery weather you may find that they have chilled to death from standing under the eaves or a drain pipe.

When three or four months old they will want to roost in a sheltered place. If any little turkeys look droopy, examine closely for lice, for this is usually the reason.

Coyotes and hawks will take toll of them. When there is a hawk around the old hen will crane her neck and turn her head sidewise, and give a warning call, and in two minutes there is not a young turkey to be seen. When the danger is past the mother calls and out they come from clumps of weeds, from underbrush or behind clods or rocks.

Any ponds of water or the horse-trough will prove pitfalls for them. A board put in the trough to float on the water will save many of them.

If your turkeys develop blackhead, as turkeys are prone to do, isolate them at once, putting them into warm, dry quarters, and give them plenty of nourishing food, gravel and fresh water with a small piece of bluestone in it, and wash their heads with a weak solution of carbolic acid, making them inhale a few whiffs of sulphur smoke. If the swelling is well developed, take a safety razor and make an incision under the eye, and with a fountain pen filler, or small syringe, fill the cavity with peroxide. This will cause the pus that has accumulated to escape. Be sure to hold the head of the fowl down so the mucus does not go down the throat, and then put tobacco dust on the cut, or on any canker that may be seen in the throat or mouth. This operation may have to be repeated, but once is usually enough. The swelling is reduced, and the place heals over.

Dressed turkeys bring a better price than live ones do in the market, and they do not shrink in weight, as when selling them as live weight. When ready to dress them, make an incision in the neck and allow them to bleed freely by having them hung up by the legs to a stout peg on a wall. This will keep them from becoming bruised, as they would if allowed to flop around on the ground.

As soon as they become quiet, commence picking them dry, placing the small soft feathers in one box and the coarse ones in another. An expert picker can pick a turkey in 15 minutes, or four an hour. It can be done quicker, but not so thoroughly. Clean the birds thoroughly, but do not draw them as the commission men prefer them in this condition, saying that they keep better if not cut into. Leave four or five large feathers in each wing and in the tail. Hang up over night in a cool place. When getting ready to pack them for market tie a scalloped tissue paper around the feet, and one around the head, leaving the beak out. Use a piece of narrow ribbon to tie the paper on with, also to tie the wings over the breast. Ribbon is cheap, and makes the bird look much more attractive. When packing them, place on the back so as not to flatten the breast.

Put a card to your commission man inside of the box as well as one tacked on it, as sometimes the outer one is pulled off in transit. Have the number of turkeys that you are shipping, and their weight marked on the tag, as well as your address.

In extremely hot weather special care is necessary to prevent chicks from being overheated by exposure to the sun, confinement where ventilation is bad, or overcrowding. The brooder should be under shelter, with good circulation of air around it, and the number of chicks should not be greater than it will accommodate comfortably under hot weather conditions.

THE MAN BEHIND

By W. D. White

'Tis the man behind the gun that enables the shot to hit the mark. It takes brains and muscle to make a success of anything. To succeed in rabbit raising one must think and work. Nature does her part, gives her returns freely, but she is like the little boy's mother. The lawn was cut, and when the father came home he said somebody must have worked. The little boy straightened up painfully yet proudly, and said: "Mamma worked me."

Mother nature may seemingly work you, but you will be proud of it when you see your success.

Hutches will not build themselves, but you can make them so that the stock can be fully protected and easily cared for. Neither will the hutches clean themselves; you must work to do that. Anyone can get plans of correct hutches and instructions as to keeping them clean.

One must feed correctly. At a low price you can buy books full of information about all these things, written by men from their years' of experience.

Good, healthy stock can be kept healthy, and their offspring will be likewise, if they are properly cared for.

Drafts, hot sun, dirty hutches, poor food or even good food improperly fed,—laziness and ignorance are the causes of all failures in rabbit raising.

These are the days when one must use all resources to help in making a living. The butcher, the baker and the candlestick maker want for their goods many times what they did years ago and wages are but a little higher. So what one can save and make outside of his daily wage must make up the difference.

The writer has raised rabbits for more than 20 years and has found them very profitable, but daily he has had to use his brains and muscles.

Anyone can do likewise if he will meet the conditions.

HOW TO FEED BARLEY

By Jean A. Koethen

Hens do not as a rule find whole barley, fed in its natural hard, dry state, very palatable. Sprouting it four or five days, or until the roots begin to show, adds to its palatability, without taking much, if anything, from its nutritive quality. If it is sprouted until the green sprouts begin to show, it becomes green feed without much value for egg making. If it is sprouted until the green sprouts are over an inch high, the hens do not care for it even as greens unless it is run through a clover cutter.

To sprout barley or oats, soak the grain from 24 to 48 hours, then pour into a flat box, or better still, into one of the trays of a sprouting cabinet. In a sprouting cabinet, each tray is shaded by the one above it, except the top one, which is covered with a moistened piece of burlap. If boxes are used, each one should be covered with a burlap sack, and the more constantly the burlap is kept moist the more rapidly will the sprouts grow. As soon as the roots show, begin feeding. If the grain is not kept fairly moist much of it will dry out and become less palatable than it was in the beginning.

When barley is fed as a scratch feed it should be scoured or hulled. Scoured barley has part of the hull removed. Hulled barley is still more palatable, and more expensive.

Rolled barley is fed dry by many poultrymen, but is more palatable when steamed. Fill a kettle or pail at night, cover with water, and let stand on the stove till it nears the boiling point. Then let it stand and swell and soften all night, and feed for breakfast. Barley steamed in this way may be made part of the moist mash if this is preferred.

HEAD OF THE HOUSE

Not long ago a Scotch minister knocked at the door of a house where a husband and wife were quarreling. When admitted, he inquired:

"Who's the head of this house?"

The man quietly replied:

"Sit yersel' doon, mon; sit yersel' doon. We're just rying to settle that noo."

Doctor—Tell your wife not to worry about her deafness, as it is merely an indication of advancing years.

Mr. Meekman—Er—would you mind telling her yourself, doctor? —Tit-Bits.

BUTTRESS & McCLELLAN
205-7 N. Los Angeles St., Los Angeles

We Harness Your Car For Farm Work

Your car has a great engine. It would run a good-sized machine shop. Best of all, it is on wheels—portable power—the only kind that can do all sorts of farm work.

Lay Porta Power harnesses your car to any work—anywhere. It runs your Lay Porta Saw down in the wood lot, your Lay Milking Machine in the cow barn, your Lay Porta Pump—your Lay Farm Light (Electric Storage Batteries)—your Lay Porta Mill.

Simplicity itself

Two levers lift the rear axle so tires rest against two steel pulleys which are mounted on a driving shaft with a belt pulley in the middle. Delivers nine horse-power to any machine that can be driven with a belt.

There is no tire slip, no heat and therefore practically no wear on tires. You get full mileage out of tires and do most of your farm work besides. Cheapest power on earth—and the most efficient.

LAY PORTA POWER

Write for facts

Let us tell you what thousands of successful farmers think of Lay Porta Power. Let us show you how the cost of a laborer for a year will solve the labor problem for the rest of your life.

All Lay Porta Implements are sold separately and are guaranteed to satisfy.

We can engage Farmer Agents in a few Counties—a real opportunity to make a lot of money in a pleasant way.

This Plug / Gives Fordowners better service

The plug with the Green Jacket

Think back! How many plugs have you thrown into the junk heap during the last year because they cracked or chipped or leaked, or because they short-circuited, or "just wouldn't work?" What put them out of commission?

Nine times out of ten, *cracked porcelain.*

The remedy is plain. Use the Splitdorf Plug, the plug with the unbreakable mica core. It cannot crack, chip or leak. And as it lasts so much longer, it is really much less expensive than plugs made with porcelain cores.

Although Splitdorf Plugs cost the manufacturers more than any other plug they'll cost YOU no more than the ordinary plug. All Splitdorf Standard Plugs, except Specials, $1.00. (In Canada $1.25.)

There is a type of Splitdorf Plug best suited to every engine. Our booklet will tell you the exactly right type for YOUR engine. Write for it TODAY.

CATTLE

100 HIGH GRADE HOLSTEIN COWS AND HEIFERS
8 REGISTERED HOLSTEIN BULLS

ALL TUBERCULIN TESTED

AT PUBLIC AUCTION

NAPA STATE HOSPITAL, NAPA, CAL.

SATURDAY, MAY 3, 1919.
Beginning Promptly at 10 A. M.

The famous Napa State Hospital herd of grade Holsteins has been headed by registered Holstein bulls for the past 14 years and has been regularly tuberculin tested for the past 10 years. Last year the 117 milking cows and heifers in the herd averaged 11503.6 pounds milk. Every animal over six months of age in this sale is tuberculin tested.

The cows and heifers in this sale are out of the best grade cows in the herd, only the best producers ever having been retained, and they are sired by such registered bulls as Lord Asa, Prince Rag Apple Imperial Korndyke, and Colony Wadmantje Aaggie, whose dam made 18712 pounds milk and 781.25 pounds butter in one year as a 4-year-old and later made 33.01 pounds butter from 552.6 pounds milk in seven days.

The bred cows and heifers in this sale are in calf to the noted Napa State Hospital registered herd bulls, including Sir Dutchland Colantha of Longfield, N. S. H. Hazelwood Netherland Korndyke, and a son of Raphaella Johanna Aaggie 3rd, who holds the world's strictly official record for milk produced in one year.

A SPECIAL FEATURE—We will sell the twin yearling daughters of the great grade cow N. S. H. Monte who made 20,596.4 pounds milk and 762.28 pounds butterfat in 10 months in the California State Dairy Cow Competition, carrying a calf 5½ months, and they are bred to a son of Raphaella Johanna Aaggie 3d, the world's strictly official yearly milk record cow.

EIGHT REGISTERED HOLSTEIN BULLS, choice individuals and most of them out of official record dams up to over 29 pounds butter in seven days. Some of them are ready for service right now.

Come to the sale whether you want to buy or not. We believe you will be interested in seeing for yourself what the Napa State Hospital is doing to advance the dairy and breeding interests of California. Parties from the interior will find the new paved highway completed all the way into Napa.

Auctioneer—COL. BEN A. RHODES, Los Angeles; Sales Manager, C. L. HUGHES, Sacramento.

THE GREATEST SALE

OF STRICTLY HIGH GRADE

HOLSTEIN COWS AND HEIFERS

EVER MADE IN CENTRAL CALIFORNIA

TUESDAY, APRIL 29, 1919

THE JAMES M'GILLIVRAY RANCH

SACRAMENTO, CALIFORNIA

Owing to the rapid increase of his herd of registered Holsteins, which now numbers close to 250 head, James McGillivray will make an absolute dispersal at public auction of his well known high producing herd of grade Holsteins on the above date. This is a remarkable herd of well marked, good uddered grade Holsteins famed wherever known for their high production which is their inheritance from many generations of high class registered Holstein bulls. Watch next week's issue for detailed announcement which will interest every prospective buyer of high producing grade dairy cows. The McGillivray Ranch is south on 21st St., Freeport Road, 2 miles from Sacramento city limits.

Auctioneer—COL. BEN. A. RHOADES, Los Angeles; Sales Manager—C. L. HUGHES, Sacramento.

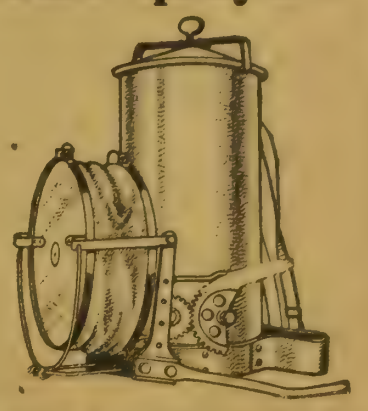
WESTERN DUROC BREEDERS MEET

The Duroc-Jersey breeders, aroused by the activities of the other breeders, held a meeting at University Farm Friday, April 11.

Fred De Vore of the Duroc Bulletin, who is making a trip through the Western states for the National Duroc-Jersey Association, gave a very interesting talk and also showed moving pictures of various herds in the East.



De Vore in his remarks laid special emphasis on advertising both for the breed and the individual breeder. It was decided to hold a guaranty bred sow sale at the University Farm either in January or February.

A committee to be selected by President Johnson will have entire charge of the sale and every animal offered will be selected by this committee and must come up to the standard set.

The committee and date of the sale will be announced later.

Johnson stated that the futurity to be held during the state fair had filled.

Sulphur

It has been proven and so recommended by the University of California that if you sulphur your grape vines and orchards SIX times they will not be affected by MILDEW or RED SPIDERS.

ANCHOR Brand Velvet Flowers of sulphur, also EAGLE Brand, Fleur de Soufre, packed in double sacks, are the fluffiest and PUREST sulphurs that money can buy; the best for vineyards; the best for bleaching purposes, LEAVING NO ASH.

Try our new brand of VENTILATED Sublimed Sulphur, 100 per cent pure, for making Paste—(Atomic Sulphur)—and for dusting.

For Lime Sulphur Solution, use our DIAMOND "S" BRAND refined Flour Sulphur. We can furnish you this sulphur at such a low price that it will pay you to mix your own solution.

To create additional available plant food, drill into the soil 100 to 400 pounds per acre of our diamond "S" Brand Powdered Sulphur. Write direct to

San Francisco Sulphur Co.

624 California Street, San Francisco, Cal.

We are equipped to make immediate shipment. Send for illustrated booklet; price list and samples, and please state for what purpose you use the sulphur, quantity needed, and date of shipment preferred. Tel. Kearny 871 .

Bay and Mateo Sts. Los Angeles, Cal.

Only four easy hours by auto from Los Angeles, over 83 miles of pavement and 7 miles of good mountain dirt roads, brings you into nature's playground.

Here you find the hotel and camp, the big oaks, the rippling stream, trails, fishing, bathing and the many other pastimes that make you feel young again.

Trout fishing is exceptionally good now at Wheeler's Cold Springs, which camp is situated on the Sespe River, 9 miles further back in the mountains. This camp is reached via the Saddle Animal route and is a wonderful trip.

Come up and enjoy your week-end.

Household Department

IT IS THE SPRING

See this joy of sparkling morning,
See this light the day adorning,
See this sapphire vault;
See these birds in sunshine twirling,
See these happy flocks returning,
See the brooks exult—

See them with the willows blended,
See these tears from twigs suspended,
See the green new-born;
See the mountains, see the valleys,
See the bees and moths on sallies
Hear this Nature's horn!

All around pulsating, thrilling—
See—it is the spring!
—Alfanasiy Afanasyevich Fet (from "Russian Poets and Poems," by Mme. N. Jarintzov.)

MINIATURE REPUBLIC

By Carl Machold

WHEN one thinks of a republic, he naturally assumes that it is a country of considerable area, governed by and for the people. When one learns of a monument, he thinks in terms of stone, or marble or bronze, and yet within forty miles of Los Angeles and six miles of Pomona is the Junior Republic, turning out living monuments of success, as the result of faith and hope and charity on the part of some of our thinking citizens—citizens who have the best interests of our coming generation at heart.

Some nine years ago several public spirited people, learning of the great number of boys who for one reason or another strayed from the straight and narrow path, determined to help these boys. As a result of their continuous efforts, and the generous financial help of public spirited men and women, the California Junior Republic has instilled hope and ambition in the hearts of hundreds of boys.

The Junior Republic was incorporated to help the boy who is getting beyond the control of parents and school teachers; who plays truant from school and associates with like or more worthless boys. If left to his own devices, he goes from bad to worse and eventually is sentenced to a reformatory or prison. When a parent, juvenile judge or probation officer wishes to give a boy another chance before sending him to a reformatory, the facts are written to the Junior Republic. If there is room for another boy and he appears healthy, mentally and physically, he is accepted as a "citizen" of the Republic.

The older boys soon make his acquaintance and he is taken around to the various industries and introduced to the boys and instructors. The fun and the experiences in the swimming pool, the ball grounds, the up to date gymnasium, the library and club rooms are eagerly told the new citizen.

The Republic boys spend one-half of each day at school and the other half at a useful industry during the school period. The Republic, in addition to the cooking plant and laundry, has an electric and machine shop for which there are many applications, and which is an ideal place for a boy wanting to become an electrician or machinist. The boy now in charge of the dairy is taking a correspondence course in dairying in addition to his practical work; he can use the Babcock milk tester, can differentiate between a good milker and a "boarder," and tell the reason why; he understands pedigrees of dairy stock, "line" breeding, etc.; he has had flattering offers to work for dairymen at good wages, but—prefers to say with the Junior Republic until he can better fit himself as a herdsman for a pure bred herd. He is an assured success along his chosen lines.

Another boy has taken an interest in hogs and has charge of the piggery. He has won prizes at the Riverside Fair on his entries and special mention in a write-up in two agricultural papers. Another boy has been placed in charge of a herd, whose foundation hogs average cost was $1000 each, and is giving splendid satisfaction. Other boys learn to operate the tractor, and this is a wonderful attraction to the boys. It has, as a matter of fact, often been demonstrated that it is a privilege to become enrolled as a citizen.

The Republic also has a well equipped printshop, where the boys print a monthly magazine and edit as well as print a weekly paper. Copies of both the weekly and monthly papers are sent to former citizens and instructors in France as well as in far-away Siberia. Positions await every boy who makes good here, and many are now holding responsible positions.

The boys have their own officers. They elect their mayor, council, judge, etc., and do considerable electioneering. The present judge, a manly young fellow, works in the electric shop and attends school during the day, a jolly good boy, but as solemn as an owl when presiding. When "His Honor" enters the court room, all stand until he seats himself. He has a record as being most just to all litigants.

At least two former mayors are now established in Los Angeles and possibly 100 or more have been in the army. When one considers the difference to society between workers and shirkers, producers and parasites, uplifters and down and outs, healthy and sick, ambitious and lazy, plodders and drones, then he is amazed at the results accomplished by this handful of philanthropists who make dreams come true.

The Republic has had over 700 boys who had the wrong start in life, many of them indolent, and some who had come before the court on serious charges. All of these boys were benefited to some degree by their sojourn at the Junior Republic, and a large per cent are now good, industrious, law abiding citizens in the greater republic.

USING LEMONS

I thought, perhaps, I might help "A Young Housewife" in the use of her lemons as they make lovely salad dressings.

New Pine Salad

Four medium sized apples diced, two bananas diced, one orange diced, one level tablespoon sugar sprinkled over mixture.

Dressings — One-half cup sugar mixed with one level teaspoon cornstarch. Juice of one lemon. One-half cup of water and pinch of salt. Bring to boil in porcelain or aluminum pan and when cool turn over mixture.

My "boys" say it tastes like a pine board smells, "but they sure like it."

Salmon Sandwiches

Take a small can of salmon and two young onions the size of your finger and use two-thirds of the top with the rest. Chop or grind or simply cut in very small bits and mix thoroughly with the salmon which has been drained of all liquid. Squeeze into this the juice of half a lemon (more if liked), and stir evenly through it. Butter slices of bread, cover with lettuce leaves and spread with the prepared salmon.—The Wife.

THOSE LEMONS AGAIN

I am a constant reader of the Cultivator—look forward to it each week. I must say it is one of the best farm papers we ever had. Nearly each week I find some question answered for some one, that has been in my own mind. I was saved the time in writing to you.

Now A Very Young Wife's query as to what she can do with a barrel of lemons. If they were mine I should use them in making a syrup, bottling it up and keeping for pies, lemonade, flavoring puddings, cakes, ices, and lots of other uses could be made of it. How lovely on a very hot day a few spoonsful of it in a glass of Shasta water! I can taste it now.

But if she doesn't care to do that and the lemons are in good condition why doesn't she offer them for sale to the readers of the Cultivator? I am sure if the price were right many would be glad to get a few dozen, because lemons in the stores are so high that I know I don't use as many as I would if I had a barrel full.—St Helena Subscriber.

VALUE OF GIVING

That man may last, but never lies,
Who much receives, but nothing gives
Whom none can love, whom none can thank,
Creation's blot, Creation's blank.
—From an old scrap book.

FIRELESS COOKER ONE PIECE DINNER

By Minnie C. Childs, Tustin

Four cups cooked hominy, five potatoes, two good sized carrots, two teaspoons salt, one cup tuna, two cups milk, two tablespoons fat, two tablespoons flour.

Cornstarch may be used instead of flour. If brown gravy is desired, brown flour in fat; stir fat over fire to melt; add milk and flour, cooking slowly; add vegetables, cut in small pieces, stir in hominy and tuna, season with salt, and if desired a little dried celery tops or parsley may be added or a sweet pepper very finely minced. Place in fireless cooker two hours.

This may be varied by using rice instead of hominy, tomatoes in place of milk, cup of any finely chopped meat in place of tuna. A delicious, satisfying dinner for six people.

Hominy is an excellent food if properly prepared. It must be well cooked. To two cups dried hominy that has soaked over night, have ready two quarts of boiling water to which has been added two teaspoons salt. Place in fireless cooker over night and you have a delicious basis for breakfast, dinner or supper. Serve plain with milk for breakfast, adding dates, figs, bananas, or nuts as a dessert or bake with thin custard for supper.

The addition of a cup of milk and a little grated cheese, baking one-half hour, makes a good, substantial, tasty dish, and as a basis for many vegetable combinations, with or without fish or meat, you may have any number of delicious, attractive, nourishing dishes.

Hominy Pudding

Two cups cooked hominy, two cups milk, one egg, two tablespoons honey, one cup cooked and seeded prunes, a little nutmeg grated over top.

Mix hominy, milk, honey, add well beaten egg, mix well; grate nutmeg over top; place in greased pudding dish, heat slowly and put in fireless cooker one hour; will not hurt if it stands longer. If baked, one-half hour is sufficient.

Honey

Honey may be used to sweeten dried fruits, prunes, apricots, apples, berries, also lemonade and fruit juices.

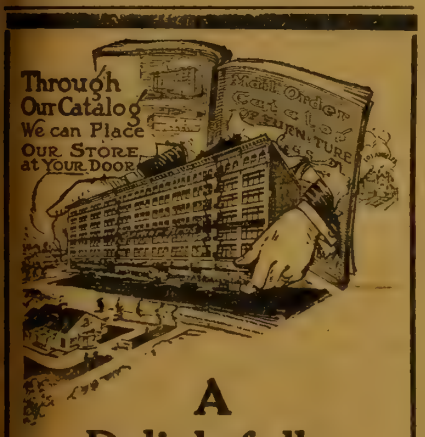
It may be substituted for sugar in cookies, gems, and plain cakes, using one-third less of honey than sugar.

A Jelly Hint

In making jelly, carefully extract juice and boil well before adding sugar. Measure, and add sugar, cup for cup, and boil just long enough to jelly. If sugar is heated before adding the boiling juice it will not require so long cooking; at least one-third of the time is saved. The shorter the time jelly boils the more delicate it is. We all like the kind that "quivers" yet stands up.

ALREADY PREPARED

Many busy women who do their own work have little time left or are too tired to think much about improving their physical beauty. When you have been washing out your house dresses, you forget that half the work of manicuring is already done for you by the soaking of the suds. Your nails are already prepared without your having given an extra moment or even a thought to it. Sit down and rest a minute with an orange stick in your hand, and while the cuticle is still soft and loose, gently urge it back away from the nails. Do this every day when you finish washing your dishes or whatever else it may be. Then rub a bit of sweet oil into the roots of the nails and finger ends. This will replace the nourishment that too much water is likely to destroy. Wipe thoroughly on a soft old towel, giving the oily nails a few extra strokes. You will be surprised how well your nails compare with those of your neighbor who has abundant time to lavish with enamel and buffer.—C. B. in Successful Farming.



SOME USES FOR "OLD THINGS"

A way to use men's discarded trousers: Rip up, wash and press, cut into six inch squares, sew together on the machine enough for a top for a comfort. If you have a worn blanket use that instead of cotton which is so expensive now. Get dark outing flannel for lining, tie with luster cotton and you will have a nice warm comforter for these chilly nights. Also a fine addition to your camping outfit next summer.

Stove holders can be made from the pockets, by putting a piece in and stitching on the machine

One can use the ends of bath towels, when the centers are worn thin, for wash cloths. Cut regulation size, crochet around edges with knitting cotton. Good bath towels can be made from the best part of a worn bed spread by cutting into towel sizes, either hemming or crocheting edges with knitting cloten. These days when towels are so expensive we will find this helps out.

Do you use a gas range or oil stove? A piece of sheet iron cut to cover the whole top is a great convenience and fuel saver. With the use of this one burner will often take the place of two or three in warming up foods, and the problem of keeping them warm until serving time is solved.

A Delightfully Furnished Home For Every Ranch and Farm

YOUR HOME may be far from the city, yet it need not lack the city-home comforts. It can be just as modern in its appointments—just as cozily and beautifully and comfortably furnished as any city home, and well it should be.

GRANT SIX

The Comfort of the Grant Six is as Pronounced as its Economy

You should have a comfortable motor car. Without real comfort you sacrifice half the pleasure of motor car ownership and it's the best half. There is no substitute for comfort.

So, because it is a pronounced feature of the Grant Six directly traceable to its unique spring suspension, we invite your special attention to this virtue of the Grant Six.

We know of no other light car that rides so easily. Owners continually impress this point on their friends. Friends are equally quick to comment on it.

Thus the Grant Six enjoys a unique reputation as an exceedingly comfortable car that is as well earned and well deserved as its splendid reputation for economy.

It is possible to explain the great advantages in engineering terms, but no explanation can be half so eloquent or convincing as a ride in the Grant Six. Make a point to get that ride.

As to economy we simply point to the fact that though this is a *six-cylinder* car, with overhead valve motor, with full seating capacity for five passengers, owners average 20 miles to the gallon of gasoline, 900 miles to the gallon of oil and 7000 miles to the set of tires.

And these are *average* records. Many do even better. Some exceed the average records by twenty to thirty per cent.

The Grant Six is a model of sturdiness, style and good finish. It is completely equipped.

From these five styles select yours

Five-Passenger Touring Car $1120—Roadster $1120—Coupe $1625
All-Weather Sedan $1645—Demountable Sedan $1400
All Prices F. O. B. Cleveland

GRANT TRUCKS

are now built in 1800 lb., 1½ tons, 2 tons and 3½ tons capacities. All are electrically started and lighted. All are completely equipped—and all are priced at figures that mean most truck value for every dollar.

Write for descriptive literature on passenger cars, trucks or both and name of nearest dealer.

2.75@2.90 for rain damaged; Milo maize, 2.80@2.90 for dry and 2.60@2.75 for rain damaged.

Rye: 3.50@4.00.

Wheat—Following are net weight prices for bulk grain, based on federal standards and grades at San Francisco Bay and Los Angeles terminals:

Hard Wheat—	Per Bushel	Per Central
No. 1	2.20	3.62 2-3
No. 2	2.17	3.61 2-3
No. 3	2.13	3.55
Soft White—		
No. 1	2.18	3.63 1-3
No. 2	2.15	3.58½
No .3	2.11	3.51 2-3
Club and Sonora—		
No. 1	2.16	3.60

For sacked grain add nine cents per bushel of 60 pounds to above price. Deduction of three-fourths of a pound is made for weight of standard grain bags. Wheat grading under No. 3 and mixed or smutty wheat will be purchased according to merit.

Mill Feed (per ton): Bran, 41.00@44.00; shorts, 42.00@45.00; middlings, 50.00@52.00. Rolled barley, 49.00@50.00; alfalfa, 30.00@32.00; scratch feed, 3.50 per cental.

HAY

Under date of April 12, Scott, Magner & Miller says:

Receipts past week 1693 tons. The market in this city continues dull. About the only demand noticeable is a slight inquiry for fancy wheat hay in light bales for retail purposes and fancy alfalfa hay. A small amount, however, would be sufficient to fill all requirements. Most of the arrivals have been of the medium and poorer grades of hay and these drag along without much demand, concessions in price being continually made to effect sales.

Some orders have been placed during the past week by the government for shipment but as local dealers holding large stocks have obtained these orders and are filling out of their warehouse stocks, it has had practically no effect upon the general market either in the country or city. There has been some demand from the interior for alfalfa and prices in consequence have been fairly well maintained. With favorable weather the cutting of first crop alfalfa as well as volunteer hay in the early districts will commence very shortly. In fact, in some sections cutting has already commenced in a small way but before the end of the coming week no doubt it will be quite general. This promises very early new hay and farmers are endeavoring to dispose of their hay on hand before the new crop is available. Conditions are most favorable for a very large crop of both alfalfa and hay.

Fancy Wheat hay (light five wire bale).....21.00@23.00
No. 1 Wheat or Wheat and Oat hay .....17.00@19.00
No. 2 Wheat or Wheat and Oat hay .....13.00@16.00

Citrus Fruit Market

Los Angeles, April 16, 1919.

There have been a number of shipments of off sizes of under grade fruit which have, in auctions especially, somewhat demoralized the market on ordinary grades. High quality stock is still commanding exceptionally good prices. Any f. o. b. California quotations which are made, are around $4.50-$5.00.

The lemon market is somewhat stronger but still lacks firmness in many sections. There are around 50,000 boxes of foreigns afloat.

Shipments

Shipments of citrus fruits to date since November 1, 1918: Southern California; oranges 15,576 cars, lemons 3610, total 19,186. To same date last season; oranges 7396, lemons 1917, total 9333. Central California this season; oranges 3015, lemons 354, total 3369. Last season to same date; oranges 2266, lemons 113, total 2379. Northern California; oranges 244, lemons 2, last year same date 202.

MARKET NOTES

In common with other spring vegetables asparagus in the central part of the state has been badly retarded by cold rainy weather. Cuttings last year at this date were light, and this year they are much lighter and the season is the latest in years. Usual shipments vary from 250 to 600 cars per season depending upon the earliness of the crop. Movement will be light this year especially if Eastern crops develop early. The usual pack of canned product runs from 800,000 to 1,000,000 cases per year. A heavier pack than last year is expected.

The earliest cantaloupe plants are in bloom in the Brawley district.

Lettuce moving slowly. All early patches gone, few new patches starting with better quality. San Fernando district—Lettuce movement is considerably heavier and cuttings are equivalent to about 12 cars. Practically all were trucked to Los Angeles for final disposition. The quality of lettuce now moving from here is very fine and of good size.

Onion planting is finished but carlot shipments of early varieties are not expected before the last of May. The early crop shows slight increase over last year, but late plantings for the main crop are somewhat reduced. Preliminary estimated indicate 7000 to 7500 acres, including contracted stock. The wet weather is promoting excessive weed growth in certain districts which may induce abandonment of the worst fields.

The chile pepper crop in the Colma district is estimated around 1800 acres with approximately 400 cars for shipping purposes. These are developing satisfactorily and first shipments are expected around April 15.

The spinach crop of Central California came on late. Market conditions discouraged shipping. Full acreage under contract was not planted as canners induced growers not to put in late crops.

It is estimated that there are 99 acres of tomatoes in the Coachella Valley. Growers in the Oasis district have replanted some of them five times and now have only a partial stand. Condition estimated this week 50 per cent, but later than normal.

The onion acreage in the Delta district is not yet officially determined, but estimated at 7500 acres, which includes contract seed stock. Early red onions at Stockton district will be ready around June 1. Acreage estimated to be about the same as last year.

Late cabbage in the Fullerton district is improving in quality.

About 900 acres of cantaloupes have been planted in the Thermal district.

The Alameda district has shipped out practically all its cauliflower. Shipments from the entire Bay district will probably be cleaned up in a few days.

Los Angeles County is now increasing shipments of lettuce as Imperial County's shipments decline. Total movement from the state in April will be lighter than in March.

Very little increase is shown in potato planting over the state.

It is expected that the state work on the roads of Arizona will be well under way by July 1. Approximately $1,750,000 will be available for roads and bridges; in addition there will be about $1,000,000 of federal money available during the year beginning July 1. Several counties are planning road improvements and will undoubtedly issue bonds. The plan for a bond issue of $4,000,000 in Maricopa County is being met with great enthusiasm and little opposition.

The forest service will build 232 miles of roads in the national forests of Arizona during the next two years. A fund of $1,300,000 is available for this purpose.

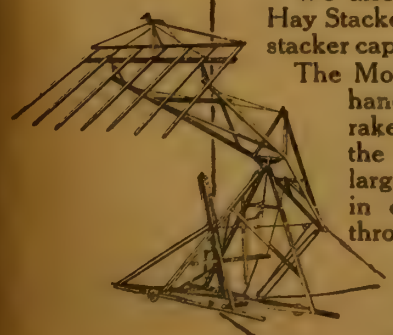
Wagons
Moline-Universal Tractors
Stephens Salient Six Automobiles

Put up your big hay crops with Moline Sweep Rakes and Stackers.



They enable you to do your work speedily, handle your hay crops without damage by breaking or shattering, stack it lightly to prevent packing, and top off the stack with a high crown to shed rain.

Moline Hay Tools are light, strong and durable. With them the fewest number of men do the most work and put up hay so that it remains good until used.

The Moline Swinging Hay Stacker offers the most speedy, economical and practical method for stacking big hay crops. Two men and one horse can stack 25 tons a day with it. Builds a stack 25 feet high. Loads from either side and is easily transported from place to place. It is entirely automatic in its action.

We also build the Moline Overshot Hay Stacker, which is an adjustable arm stacker capable of making a 20-foot stack.

The Moline Power Lift Sweep Rake handles hay with greatest care, rakes clean, and automatically lifts the load for carrying. Has extra large size steel axle 2 7-16 inches in diameter, and is extra strong throughout.

The Moline Pipe Axle Sweep Rake is another, extra strong, serviceable sweep rake which we manufacture.

Your Moline Dealer will gladly tell you about Moline Hay Tools. Ask him or address us for complete information.

"MAKES HENS HAPPY" is the title of a helpful and practical booklet we'd like you to have. Gives you the advice of poultry experts—tells you some of the things you ought to know about poultry practice—shows you how to increase your poultry-profits. A copy is yours for the asking. Simply fill in the coupon below and mail *today*—we'll see that you get your copy without delay.

AND the biggest single help you have in pulling them up the upgrade is—what? *Proper feeding!*

Take these chicks from the time they are about five weeks old until they are eight weeks old. What do they need most to effect a good, healthy growth? Do they need fat? Not especially! They need *bone and muscle.*

And the *only* way you can expect these chicks to develop into healthy, vigorous birds—the *only* way you can expect to produce a thrifty growth—is to give them the essential food units they require to build this bone and muscle.

And that's exactly what you do when you feed Sperry Suregrow. For, it gives your growing chicks just what they need to develop properly. More than that—it gives them the *physical foundation* that means good layers and good breeders—and, incidentally, *good profits.*

And—don't forget this: the money you invest in Suregrow will come back to you many times over in the increased health and vigor of your flock. It's surprising how many chick troubles—indigestion, moping, slow growth, etc.,—all disappear when you feed this balanced ration! For, Suregrow is the one feed you can depend on *absolutely* to produce a good, sturdy growth—a growth that goes a long way toward future profits!

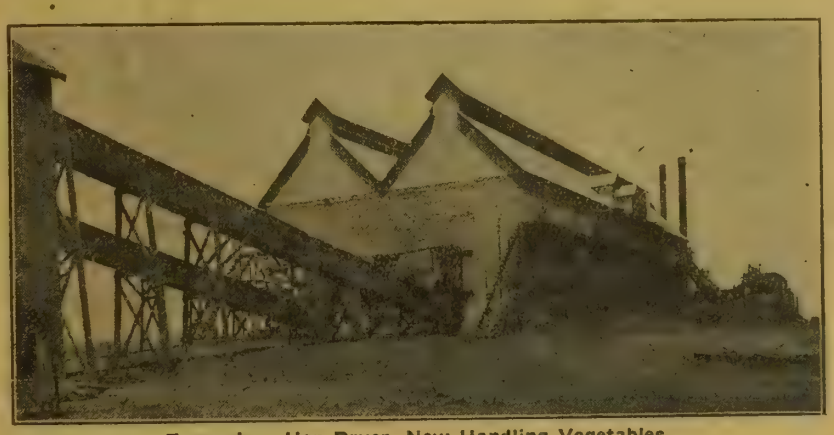
The New Dried Vegetable Industry

By Arthur L. Dahl

DRIED or dehydrated vegetables are new forms of food to which we are soon to become accustomed if, indeed, we have not already tried and liked them. We have had dried figs, raisins, prunes and scores of other articles of food for a long time, and it is strange that dried vegetables have not become popular here before as they have in Europe. For years evaporated vegetables have formed a staple article of diet in Germany, Holland and other countries, and as far back as the Boer war England purchased large quantities of the product to feed her soldiers in South Africa. Some of these supplies were left over and stored until the commencement of the present war, and upon examination were found to be in good condition and were used to feed the soldiers, thus demonstrating their keeping qualities. Millions of pounds of dried vegetables were purchased, and are still being purchased, by England, France and Italy from Canada, and these are shipped to Europe and Asia. Germany is said to have 1350 drying plants devoted to dehydrating potatoes alone, and the quantity of potatoes dried in that country annually is in excess of 800,000,000 bushels, or twice the normal total production of this country.

When the United States became an active participant in the war and began to send fighters abroad we were told that not only must we equip these men for fighting but we must also maintain them while on foreign soil. They must be fed and clothed and cared for from the United States, and to the existing problems of shipping was added the handling of the tremendous bulk and weight of food to feed the increasing numbers of Americans sent to France and the other battle-fronts. The boys making up our armies were used to the kind of food they always got at home, and to keep them in good condition it was considered necessary to supply them with various kinds of vegetables. The fresh was only available for short periods, and then its perishable character and weight prevented shipments for long distances. Canned goods, while excellent food, were likewise heavy and bulky. After investigations carried on by government food experts, including a public hearing before a senate committee on the subject of dehydration, the war department decided to follow the practice of the Allies and use dried vegetables to send abroad. A contract for millions of pounds of dried potatoes, carrots, soup vegetables, etc., was made with E. Clemens Horst of San Francisco, a large hop grower who had, on his own initiative, made elaborate experiments in drying vegetables in one of his hop kilns, and produced a superior quality of the product. As fast as his hop driers could be converted into vegetable drying plants they were used for that purpose until ten large establishments in California and Oregon were working night and day for the government. Practically all of the vegetables processed were grown on lands in the immediate vicinity of the driers, thus avoiding much handling and the loss through wiltage which occurs when they have to be shipped any distance. Potatoes, however, were bought in the large centers.

In addition to the plants operated by Mr. Horst others in different parts of the United States were given government contracts, and new companies are being formed very rapidly and the industry bids fair to develop into an extensive one, even after war contracts are ended, because of the vast domestic demand which can be developed once the people become accustomed to the use of this new form of food.



Preparing Vegetables for Drying

In the Horst plants the vegetables as received from the field are hand-picked and sorted before going to the machines for cleaning and peeling.

In sending dried vegetables abroad the government saved an enormous amount of tonnage, because the dried product, being all pure food, without waste, is equivalent in food value to many times its bulk and weight of either fresh or canned. In fresh vegetables from 60 to 85 per cent of the entire bulk is made up of water, and this water is not only retained in the cans but added weight and space is given by the containers. A 2¼ ounce package of dried tomatoes is equal, in food value, to a 60 pound case of canned tomatoes, so it is apparent the tremendous saving in handling and transportation which will accrue from the use of the dried product.

Dried vegetables will keep indefinitely and are ready for use after soaking for a few hours in water to restore their bulk. When cooked they have virtually the same flavor as the fresh, and such food experts as Professors Fairchild and Alsberg of the department of agriculture assure us that in the process of drying only the moisture is removed, the texture and food values and the flavor are unimpaired.

Formerly a Hop Dryer, Now Handling Vegetables

Twin drying plants on the Horstville Ranch which have been a great factor in reducing the bulk of California vegetables.

At the time Mr. Horst conducted his experiments in the drying of vegetables he distributed hundreds of pounds of the dried vegetables to hotels, cafes, clubs, hospitals and public institutions throughout the country to test their flavor and food qualities. In practically every case the chefs or dietitians who conducted these tests not only reported favorably upon them but requested to be furnished with permanent supplies to be used in their institutions. Such famous hotels as the Biltmore and the Ritz-Carlton of New York, the Willard of Washington and the Palace and St. Francis of San Francisco are regularly using dried vegetables, even when fresh stock is available. The saving in preparation, the elimination of waste, and the close approximation of taste and appearance of the dried to the fresh enables it to compete successfully with the latter.

Even the housewife is learning the advantages of the new product, and the various dehydrating companies report an increased demand for samples, followed by orders for practically all varieties put up. In the current magazines the foremost dietitians of the country advocate the use of dried vegetables in the home, pointing out that the human body requires the various mineral salts supplied only by vegetables, and these salts are retained in their original purity in the dehydrated product. The fact, too, that the average housewife can, by using dried vegetables, keep on hand for any emergency all varieties of vegetables, ready for almost instant use, will prove a big factor in introducing the new food into the home. In the middle of winter the same kind of a meal can be served as during the growing months of summer, and the monotony of the winter diet can thus be avoided.

General View of Vegetable Dryer

The drying plants of hop yards proved a material factor during the war in dehydrating great quantities of vegetables for shipment across. This is a general view of a Sacramento plant.

The universal use of dried vegetables would result in saving the large percentage of loss sustained in handling the fresh produce, ranging as high as 50 per cent in some cases. Added to the deterioration sustained during the transportation from producer to consumer, from 20 to 40 per cent of the bulk is discarded in the form of tops, roots, peelings, etc. This is practically all wasted because the average housekeeper makes no use of it, whereas at the drying plants all waste is saved and fed to cattle or hogs. At the Horst plants in California even the water used to wash the vegetables is saved for its mineral salts and mixed with the stock feed.

Vegetables are readily grown almost everywhere, and if large commercial or community drying plants are maintained throughout the country, an enormous amount of unused land could be utilized for growing vegetables, as the growers would be assured of a market for their product. The limited market now existing for fresh vegetables would be enlarged to take in the whole world, because dried vegetables are easily shipped anywhere and will keep in all climates.

Vegetables for drying are picked when fully mature and after being sorted by hand are placed in machines which peel, slice or otherwise prepare them for the drying room. Trays of the sliced vegetables are placed, one upon another, in the drying rooms, where currents of warm, dry air exhaust the moisture, leaving the food structure unimpaired. After a few hours in the drier, the product is put up in paper cartons or large tin cans, and it is ready for the market.

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertisers in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

THIS WEEK'S COVER

The cover illustration is simply a shadow of a coming event which will give opportunity to all within reach of Sacramento to gather a fund of information regarding power and implements necessary for more efficient, more profitable, and more satisfactory farming operations. Scenes similar to that depicted in this illustration will be constantly shown at Arden Acres, May 6 to 11. A bit of the determination of farmers to get information as to the latest in power farming is shown in this illustration, which is from a photo taken at the Los Angeles demonstration last fall.

GOVERNMENT NITRATES

Pacific Coast fruit growers who may have desired to purchase government nitrates, especially those in the southern part of the state, feel that "government nitrate at cost" has been of little benefit to Coast producers. There was some nitrate delivered to San Francisco at $81 per ton, which, by the time it reached producers' hands, cost approximately as much as when purchased from the regular dealers. In Los Angeles County, for instance, the saving was usually somewhat less than one dollar per ton. Last year's deliveries were entirely on the South Atlantic Coast. It is possible that another year they may reach to other points, though we take it this will depend upon circumstances, for the greater number of this year's sales have been from the supply which was secured for war purposes.

STATE CONVENTION

The office of State Commissioner Hecke and a number of committeemen of Riverside are at work planning for a state convention of fruit growers and farmers to be held in that city, May 26-31. In fact, we believe this is to be a great convention week in which some half dozen different organizations including the fruit growers, county horticultural commissioners, coast entomologists, state nurserymen and others will unite. This is the convention which was to have been held last November. The "flu" prevented. It is expected that plans are in the making which will mean an even greater convention than would have been held at the former date.

AIRPLANE FARMING

The Cultivator is in receipt of "copy" for an article on the use of the airplane in farming operations. It is written in all seriousness and the author endeavors to show wherein the up-to-date farmer may keep in more definite touch with most distant parts of his lands and direct more intelligently the operations of his workers. Our first impulse is to scoff, but "the world do move" and with wonderful swiftness, so we will withhold our comment and watch for a few weeks developments in airplane farming.

Now comes this news letter from the state horticultural commission: "Following closely upon the novel but practical use of the airplane as an aid in enforcing the restricted zone planting of cotton in the pink bollworm districts of Texas, the federal government now adapts the tools of war to the needs of the hour, and it is planned to utilize the airplane in dropping aerial bombs which will generate smothering gases to extinguish forest fires. The far-reaching value of the idea is promising, even at this early experimental stage."

SHORTAGE OF BEET SEED

The department of agriculture is giving warning as to possible shortage of beet seed for the crops of 1920 and 1921 and urging that immediate arrangements be made by beet sugar companies for their planting requirements. Cablegrams from representatives of the department of agriculture in the Netherlands, together with other information regarding stocks in hand and contemplated plantings, indicate a serious situation. This is because of a real shortage in production and the anticipated vastly increased demand on the part of eastern France and, in fact, all of central Europe.

The present indications are that there is sufficient seed now in the hands of the beet sugar companies in the United States to take care of the entire acreage to be planted to sugar beets in 1919. The most recent information in regard to the supply for 1920 indicates that there is at present a shortage of from 25,000 to 40,000 bags. This is being met through importations in order to provide sufficient for a normal planting next year.

Dutch growers and dealers are unable to book further orders for 1919 seed and orders for 1920 delivery must be received by them this month. At the present time surplus stocks in the Netherlands are selling at 1.3 florins a kilogram (approximately 25 cents a pound) and up, though some dealers are holding for from 2 to 2.5 florins a kilogram (approximately 35 to 45 cents a pound). Reports received from German sources indicate that prices there will remain high or possibly increase during the next two years.

VICTORY LOAN

The campaign is on for the fifth and last of the Liberty or Victory Loans. The victory has been won, and because of the liberal support of former loans such preparation has been made that the lives of thousands of our boys have been saved. In turn the boys did their share right nobly, and every American should be willing to pay for so great a victory.

We have had our Liberty Loans with Liberty Bonds as security. Now comes the Victory Loan with government notes. Wherein a government note differs from a government bond we are unable to say, but here are some of the main facts regarding the government notes which will be purchased from the United States government by those who endorse America's wonderful accomplishment in the late war:

Interest rate 4¾ per cent.
Notes dated May 20, 1919.
Notes due May 20, 1923.
First coupon will represent interest from May 20 to December 15.
Interest dates June and December 15 and last coupon at maturity, May 20, 1923.
4¾ per cent notes carry the following tax exemptions: Exempt from all city, county and state taxes, with the exception of estate and inheritance taxes; exempt from normal federal income tax.
3¾ per cent notes are entirely exempt.
Campaign opens April 21 and will close May 10.
Government Installment Plan: Initial payment, 10 per cent; second payment, July 15, 10; third payment, August 12, 20; fourth payment, September 9, 20; fifth payment, October 7, 20; sixth payment, November 11, 20; with accrued interest on deferred installments.

RAISIN DAY, APRIL 30

We have noticed that when rice pudding is made almost exclusively of raisins and they are well smothered in thick cream the "eatin's" is decidedly satisfactory. We have also noticed that at the eating place where we are now getting our luncheons the cook occasionally throws a handful of raisins into the soup. The good taste of this last proceeding may be questioned by some, but the point is that raisins add to the pleasure of many a dish from soup to dessert.

To bring this fact more specifically before the people of the country the raisin growers have for several years observed April 30 as a day sacred to raisins. Raisins are sold and given away on condition that they are eaten in every form possible. Recipes are published and advertising carried in many of the large magazines, and the advantage and general healthfulness of a diet consisting largely of raisins is shown to the people. They are fine "eatin's" and somewhat profitable to the state of California which last year produced 163,000 tons of raisins valued at $25,000,000 and, thanks to co-operation, all sold at livable prices, and generally sold to consumers at livable prices.

INCREASED PRODUCTION

Sometimes Californians have to back off and look at their own state through the small end of the telescope in order to get proper perspective. We have talked much of our great citrus production, our production of raisins, prunes, fresh fruits of all kinds, and these truly do bring millions of dollars to the state, yet with it all live stock is our greatest industry. Here are a few striking figures which make this fact stand out.

The Imperial Valley is now shipping a trainload of spring lambs every week to Eastern live stock markets. On the 19th a train of 47 cars of fat steers left Los Angeles for Kansas City, where they will arrive Monday, the 28th; 471 of these finely finished youngsters were shipped by Walter Greenings of the Rock Springs Cattle Company; seven of the cars were loaded by McClure of Compton; 13 were from the ranch of J. B. Norton. This bunch of fine stuff averaged 500 pounds and had been fed on concentrates 135 days.

Chas. Robinson of the Clay Robinson Company of Chicago, who is visiting here, inspected this lot of stuff before it left and remarked that it would bring $17.50 or $18.00 at least within $17.00 to $18.00.

C. H. and O. B. Fuller are also shipping 5000 head of finished beef. All told from the southern end of the state before the end of May this season's shipments will aggregate 20,000 head; last season's total aggregated 15,500.

These shipments all represent surplus stock which it is hoped will some day be dressed in California and sent under refrigeration.

DAWN OF NEW ERA

Some day in the future one who aspires to chronicle the principal events that were factors in the live stock development of California will if he desires to be at all accurate give a large place to the events that transpired at the University Farm during the week of April 7-12.

California live stock interests wrote history during the week mentioned and many a live stock man was truly "born again." At least it seemed so. Men who a few years ago could not be interested in better cattle sat at the ringside of three sales and paid more money for pure bred bulls and females than ever changed hands in any previous week in this state, and the gratifying feature of the sales, for the most part, was the fact that these new investments were made without wild speculation brought about by the heat of enthusiasm. Values, higher than California has been accustomed to, were established by practical men who had learned the value of improved stock and who were determined to own the kind that has been proved profitable. Another feature of the week was the selling of a California bred bull calf for $5500—more money than was ever paid for a Coast produced beef bull—thus demonstrating that the breeders of this state can produce cattle as good as the best and that our cattlemen appreciate the fact.

We believe that no similar week has accomplished more for the beef industry of the state and we predict, with a certainty, that California is just entering upon a new live stock era wherein the industry will be greatly expanded and California will take her rightful place as one of the greatest live stock producing centers of the world. The wedge has been started—a few more blows in the shape of more good sales and the big start is made.

Riverside County cannery is asking for larger production of Lima beans for canning purposes.

The Mission Brand in the Making

By C. B. Messenger

SPECTACULARLY high prices for any period of time are reasonably sure to be injurious to all producers. Uniformly fair prices, or prices which give the producer cost of production and reasonable profit and deliver the goods to the consumer at a fair cost, are sure to result in permanence and the upbuilding of the industry.

One of California's best orange growers has given a lesson in securing a fair return to the producer and giving fair priced product to consumer. Likewise he is the grower of some of California's best and highest grade oranges. It has been a principle with Charles C. Chapman, a grower of oranges and lemons in Orange County for many years, that a first class quality of fruit, and uniformly first class and uniformly packed fruit should be sent from his orchards near Fullerton. There have been times when market conditions gave opportunity to sell the Chapman "Mission Brand" at prices almost spectacular, but this has been the exception; uniformly good prices have been the rule, and by good we mean good from the standpoints of both consumer and producer.

Mr. Chapman has some six or seven hundred acres, more largely planted to Valencias than any other fruit, and it is on the quality of these Valencias that Mission Brand has been built up. The first step in the production of these fruits has been the selection of the kind of fruit which does best under the soil and other conditions which Mr. Chapman had. These conditions seem to be perfect for Valencias. Hence it has been comparatively easy to produce a high percentage of of fancy fruit.

Next came thorough preparation of the soil and creating conditions in which the well selected trees could do their best. One of these conditions has been the supplying of sufficient fertility to the soil. The one greatest need in these orchards has been found to be for more vegetable mould, or humus, and this has been secured in every way, such as the purchasing of trainloads of manure from the stables of Los Angeles, green manuring, the purchase of bean straw, low grade alfalfa hay, and even the use of prunings from the trees, which have been run through large cutters and reduced to small particles and distributed over the orchard. As a regular proposition the soil gets, say, around five to six cubic feet of stable manure to each tree. This is on 30 year old Valencias. In addition there is applied about 20 pounds of complete commercial fertilizer or its equivalent. There have been years when larger applications of commercial fertilizer have been made. The growing of green manure crops has been discontinued in the older orchards. The reason for this may be seen by noting the "canyon" appearance given in the illustration of the orchard by the monster trees 30 or more feet in height. The shade has become so dense that it is practically impossible to get satisfactory stand of melilotus or green manure crop. On the younger orchards, however, Mr. Chapman has believed in using so far as possible of melilotus or other green manure crop. His favorite at this moment is melilotus, although he is giving a thorough test to soy beans. Summer cover crops have not been planted as a rule. The method of handling the melilotus or soy bean crop is by turning under with the mould board plow.

When asked as to his treatment of soil at time of blooming, that is as to whether he would plow under cover crop or irrigate during blossoming time, Mr. Chapman referred to the manager of his ranches, E. W. Hemphill. In fact Mr. Chapman added that Mr. Hemphill had been in almost entire control of the ranches since the first setting of the trees, and to him should be given the credit for a great measure of the successful work in these orchards. Mr. Hemphill does not believe it wise to give heavy irrigation or deep plowing or any other surface disturbance of the root system, if possible to avoid it, at blossoming time. This should be understood to be taken with "if possible to avoid", for there are times when one is seemingly obliged to set aside all rules. There is where many of us fail in that a principle which may be eminently sound under usual conditions ceases to be so under other conditions. If one is unable to turn under a cover crop or to irrigate his land prior to its blooming or setting of the new crop and his trees are actually suffering for moisture a greater loss might be visited upon the trees if the orchardist ignores their demands. But notwithstanding this violation, as remarked, it is the rule of the ranch not to give this heavy irrigation at blooming time.

When asked as to possible influence for good of a cover crop during month of June, when the usual "hot spell" may cause serious trouble to the newly set crop, Mr. Chapman said that he had not made test of this method but did add: "My experience has been that if our land is well irrigated when we approach the June hot spell and we then cultivate, we will avoid much of the disaster which often follows this spell. I am more and more convinced of the high value of cultivation. We must irrigate, of course, but many of us use too much water and do not do enough cultivating."

The present crop which is loading down the trees shows the wisdom of his method of treatment, and while he makes it a principle not to apply "too much" water we imagine frequent examination of soil conditions gives him exact knowledge of the demands of the trees and of the soil. When the water is applied it is with the utmost economy, through proper location and arrangement of water delivery system Illustrations on this page show the

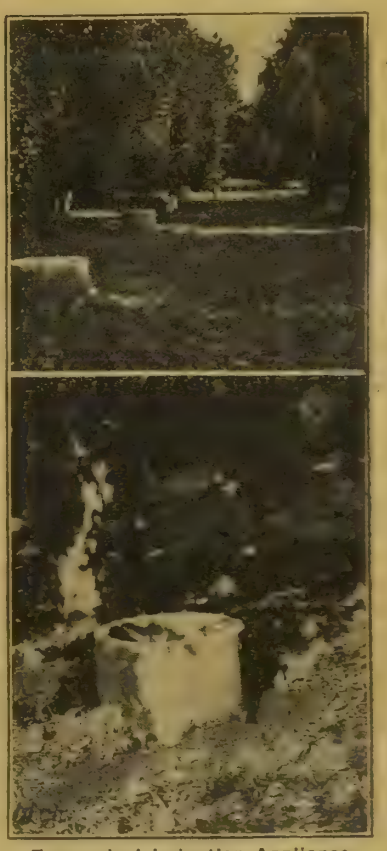
Inspecting the Coming Valencia Crop

C. C. Chapman, who has for many years shipped Valencias into New York markets, at times securing spectacular prices, is the gentleman at the right in the picture above. The gentleman at the left is E. W. Hemphill, manager of the great Chapman orchards near Fullerton. Mr. Hemphill has directed the planting and care of these orchards practically since their establishment by Mr. Chapman many years ago.



Thirty Years Old and Still Doing Fine

Looking down the "canyon" of Valencia trees on the ranch of C. C. Chapman of Orange County which has been producing crops now for nearly 30 years. This orchard has had best of care as to soil, special effort being made to keep up the vegetable mould content.

Another Form of Outlet

An irrigation appliance which is a labor saver. This is on the ranch of J. B. Neff, Orange County, and allows perfect control of water. Where an outlet is lower than another farther on the same headline, the cap permits of complete closure and forcing water to higher level

Economical Irrigation Appliance

The outlets shown in both the above illustrations are the same, the lower one showing better the location in relation to the row of trees. The outlet in each case is on the outside of the upper row of trees. This permits the turn around with the cultivator close up to trunk of tree. The back up from the outlet is sufficient to irrigate the soil on upper side of tree.

Agricultural News Notes of the Pacific Coast

Northern California

Cherries are ripe in all Sacramento Valley cherry centers.

Chico orange growers report average return of $4.16 per box.

Butte County growers are testing out a new forage grass called Harding grass.

County farm bureaus of the state are discussing the matter of forming a state farm bureau.

The Contra Costa County farm bureau held pure bred Berkshire sale at Martinez last Saturday

Supporters of the $40,000,000 state good roads bond issue are hoping for call for election on June 24.

State Commissionr Hecke estimates that California spends $5,000,000 annually in insect pest control.

Nearly 60,000 acres of the great Vina Ranch, mostly in Butte County, has been subdivided and sold.

The Hunt cannery at Haywards is being enlarged and it is hoped to soon have it running ten months each year.

Farmers in many of the rice districts have seed beds prepared for the planting of the coming season's crop.

Placerville Fruit Growers Association has awarded contracts for the erection of a warehouse and packing house.

Prune and apricot growers of Hayward have organized a branch of the California Prune and Apricot Growers, Inc.

General Manager Virden of the California Fruit Distributors report conditions are perfect this year for a big fruit crop.

Farmers of Eden Township, Alameda County, are planning for an exhibition of farm products to be held at Haywards.

The California Cattlemen's Association has endorsed the proposal to hold an International Live Stock Show at San Francisco.

Lieutenant McCormick has been appointed cow tester for Contra Costa County farm bureau. There are 835 cows being tested.

The California Almond Growers Association has passed resolutions endorsing the administration of Market Director Weinstock.

Saturday of this week farmers of California gather in the annual University Farm picnic at Davis, where the boys of the school furnish the fun and the farmers the lunch.

Apple growers of Humboldt County increased their planting during the past season as never before, and growers there propose to be a greater factor in California apple production.

The Butte County Citrus Association has elected G. E. Middlehoff, president; R. S. Powers, vice president; Oscar Warner, secretary; First National Bank, treasurer; G. E. Middlehoff, R. S. Powers, J. A. Lawrence, R. A. Leonard, W. E. Vaughan, A. C. Mastellar and Frank C. Gray, directors.

Berry growers of Sebastopol are charged with having stricken from Assembly Bill 172, known as the Net Foodstuffs Container Act, the following provision: "No containers, boxes or baskets wherein food products or other commodities are packed shall have a false or raised bottom, or be so constructed as to facilitate the perpetration of deception or fraud."

Central California

Raisin Day April 30.

Turlock melon growers are planting largely to honey dews.

Stanislaus County will plant in excess of 2000 acres of watermelons.

This has proved the greatest planting year ever for figs in San Joaquin Valley.

Wire worms are proving a worse pest than usual in the fields of Stanislaus County.

There is a greater acreage of grapes in Merced County than is given to any other fruit.

Tulare County Pomona Grange is boosting for the more general use of the Torrens land title.

Riverbank Farmers Union recently held a "Get Acquainted Social" at Union school auditorium.

Tulare proposes its location as the ideal center for a great centralizing plant for handling milk products.

Los Banos, Merced County, is milking 7000 cows, which last year produced butter fat valued at $1,400,000.

Stanislaus County pear growers have found certain winter pears are more resistant to blight than Bartletts.

Fresno business houses will close and the entire day of April 30 be given over to Raisin Day festivities, parades, etc.

The Nutting date gardens near Fresno are proving an inspiration to experimental date planting in several sections.

The California state fish and game commission is distributing young rainbow trout in the waters of the Kaweah River.

The Cattle Protection Board has inaugurated inspection of cattle at shipping point. Carriers will not accept these inspectors.

The Tulare Cooperative Poultry Association handled a greater business during the month of March than any preceding month.

San Joaquin Valley has organized a public utility association; the purpose of which is to secure just rates from the big light and power companies.

The almond growers of Merced County have joined the California Almond Growers Exchange. There are 20,000 almond trees in that county.

P. R. Jones, formerly specialist with the department of agriculture investigating thrips control in Tulare County, recommends improved methods of control.

San Joaquin Valley tractor owners are appealing for dirt extensions for paved highways so that tractors may be moved from section to section without injury.

Horticultural Commissioner Penny of Santa Cruz County recommends the use of strong lime-sulphur solution before the swelling of the buds to prevent brown rot of apple.

Horticultural commissioners of Kern, Tulare, Kings, Madera and Fresno Counties met recently and adopted standards for making tests on table grapes for the coming season.

Owing to the high prices of all kinds of material, especially of cans, the cannery at Carruthers, Fresno County, will not operate this season. The plant is to be completely overhauled preparatory to a full run in 1920.

Southern California

Coachella Valley is now shipping carrots by the carload.

California Limas are now quoted at warehouse at 7¼ cents.

The new Lima bean pool recently sold 215 cars in two days.

Southern California walnut growers anticipate a 20,000 ton crop.

Many Orange County dairymen are planting largely to sorghum grains.

The canneries at Hemet, Riverside County, are making general improvements.

Many of the oranges going to market now are run through precooling plants.

Hemet, Riverside County, reports the fruit crop will break all previous records.

Strawberries with fruit already formed and in full bloom indicate immense crop.

Riverside orange growers have been sending boxes of their finest fruit to the state legislature.

In the reelection of Mayor Vandegrift of Pomona the anti-smudge pot ordinance seems to be endorsed.

The Riverside County chamber of commerce holds all day meeting at Blythe, Palo Verde Valey, this week.

The Dairy Council is securing many members who believe in advertising more liberally of products of the dairy.

Oxnard feels that with the return of bean prosperity Ventura County again becomes the bean center of the world.

Imperial County has organized a Pima Cotton Association which will have charge of marketing and Eastern shipments.

Deputy Commissioner Weldon recently made an address before fruit growers of Victor Valley, San Bernardino County.

Southern Orange County and northern San Diego County are planting Lima beans to about the same extent as in former years.

Stockmen of Imperial Valley are complaining because of high prices of feed putting them at a disadvantage with nearer coast feeders.

Imperial Valley has shipped over 60 cars of peas, mostly to far Eastern markets. Each car consists of 370 drums and a drum averages around $10.

Farm Adviser Essig, having taken charge of the work of the Lima bean pool, he has been succeeded in Ventura County by former Horticultural Commissioner Staunton of San Luis Obispo.

The report of the Southern Pacific Milling Company, one of the largest warehouse companies storing beans, shows in its warehouses: Limas, 382,985 bags; Small Whites, 440,793; Blackeyes, 40,313.

The scrap between the fishermen and State Commissioner Weinstock continues and Lent has passed with hardly a fish in the market. San Pedro fishermen have continued to stir up trouble in other fishing sections.

Imperial Valley planting to cantaloupes has been larger than in some preceding seasons. It is practically 3000 acres greater than last year. The aggregate will be about 14,000 acres, 10,000 of which is in the Brawley district.

The Coast and General

Live stock exposition is to open in Sao Paulo, Brazil, April 21.

There are 50,000 swarms of bees in the Yakima Valley, Washington.

Yakima Valley, Washington, is experiencing shortage of farm help.

Orchardists of Hood River, Oregon, held a blossom festival this season.

Colorado produced 234,303 tons of sugar in 1917-18 and 191,880 in 1918-19.

The great bulk of the beet sugar of the United States is produced west of the Mississippi River.

It is estimated that the importation of potatoes from Canada this year will be larger than for several years.

Under the revised dairy law, Arizona dairy commissioner will be entitled to one and possibly two deputies.

Douglas County, Washington, farm bureau agent spent many weeks this spring in giving germination tests to seed wheat.

Algeria, which usually produces a surplus of grain for export to France, finds that its exports for 1919 will be greatly reduced.

A considerable delegation of Arizona good roads enthusiasts is attending the good roads conference at Mineral Wells, Texas.

South China produces large acreage of peanuts, but local consumption and crushing for oil leaves only small quantity for export.

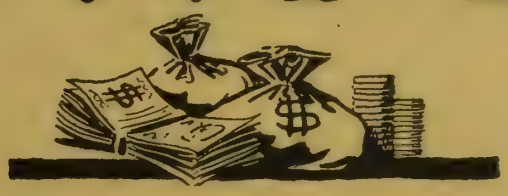
Brazilian foodstuffs are being seriously reduced by attacks of great numbers of locusts. Beans and rice and corn are all suffering.

The Yakima Horticultural Union, Washington, recently sold two cars of fancy Winesaps at $4.00. This is the record price for Yakima apples.

Some cattle growers in Yavapai County are reported to have contracted their yearlings at $36, which is about $4.00 less than last year's price.

Bee keepers of Washington recently met at Toppenish and discussed the matter of container cost. Last year's prices were $128 per thousand, this year's, $168.

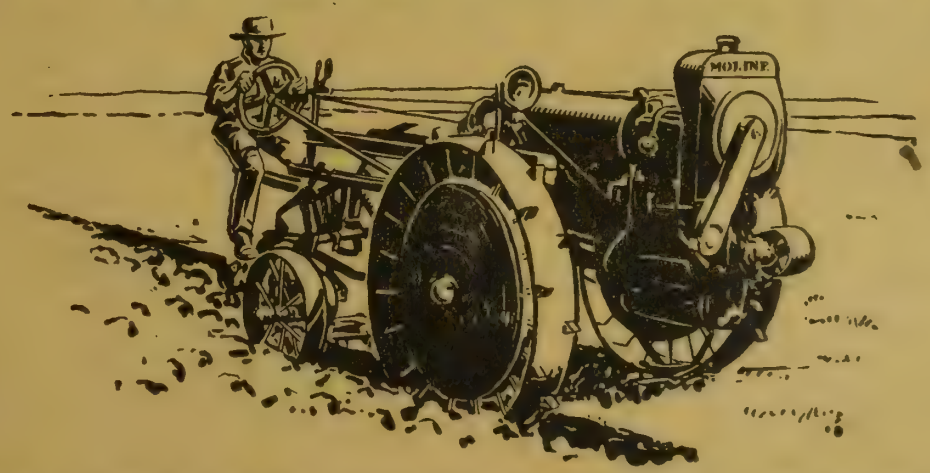
The Peshastin Fruit Growers Association, Washington, sold for its members 150,150 boxes of pears and apples, and averaged per box to the grower $1.70.



Retail milk dealers of Phoenix, Arizona, are organized, with Hubert Geare, president; Robert Webb, vice president, and George Elliott Miller, secretary and treasurer.

The importation of lemons is now permitted by the war trade board of Australia, prior to June 1, 1919. This only up to ten per cent of the quantity imported during the year ending June 30, 1918.

Live stock census in Sweden shows the number of cattle to be far lower than at any time since 1914; sheep also greatly reduced and hogs little more than 50 per cent of number shown by the 1914 census.



Homer Hamlin, consulting engineer of Los Angeles, is making an exhaustive survey of the proposed Paradise Verde Project and will later submit a report to the United States reclamation service, regarding the advisability of utilizing the waters of the Verde, either for the proposed project or to enlarge the Salt River project.

Secretary Sustains Quarantine

THE quarantine governing the importation of nursery stock and other plants and seeds into the United States is scientific in origin and purpose, and sound in principle, declares Secretary Houston after careful personal consideration. Its enforcement, he says, will make for the safety of the plant, fruit and forest interests of the country with as little injury to private agencies and individuals as is compatible with the purpose of the quarantine.

This judgment of the secretary of agriculture was announced after the briefs submitted to him by a protesting committee of florists and nurserymen's organizations, together with all department records and correspondence in relation to the hearings before the federal horticultural board, were reviewed by Thomas G. Shearman, attorney in charge of the investigation of appeals from decisions of the forest service. Mr. Shearman was instructed to include in his inquiry every phase of the subject, particularly all criticisms of the quarantine from whatever source. After studying the report of this inquiry, together with all the other records, the secretary reached his decision.

Attention is called to the care exercised to make sure that all interested persons had the opportunity of being heard. The federal horticultural board gave 60 days' notice of the original hearing. After the hearing, the whole matter was again taken under advisement by the department, and investigated for a period of three months. Then the form of the proposed quarantine was sent out in such ways that all interested parties had the opportunity of studying it. Nearly two months later, another conference was held. The suggestions made at that conference were submitted to the experts of the department and given careful consideration before the quarantine was promulgated.

After stating these facts and reviewing the various criticisms that have been made, Secretary Houston says:

"As the result of my consideration of this entire matter, it appears to me that the department had to face and solve this problem: Given the fact, on the one hand, that any importation of plants and plant products is necessarily fraught with danger from disease or pests, and the further fact, on the other hand, that entire exclusion would be unwise at this time, how could a general quarantine be drawn, so as to reduce to the lowest terms both the disease and pest dangers involved in importation, and the injury involved in restriction.

"In working out the solution of this problem, two considerations have been kept constantly in mind with reference to the different classes of plants and plant products to be covered by the quarantine order: the necessity or importance of the particular plant, and the danger arising out of its importation. The quarantine, as finally formulated, has been the result of bringing to bear upon these two considerations such technical and scientific information as could be obtained from sources believed to be reliable.

"Necessarily, there are all kinds of gradations, both in the risk of disease or infestation, and the importance or necessity of the various plants considered. Where the necessity is at the maximum, and the risk is toward the minimum, the quarantine will be found to be inoperative as for instance, in the case of fruits, vegetables, and cereals for food and similar purposes, and field, vegetable and flower seeds. When, on the other hand, the risk is at the maximum, and the necessity is at the minimum, the quarantine is found to be strict, as, for instance, in the case of plants whose roots are balled in ordinary earth.

"It is clearly my opinion that the distinctions and classes in this quarantine order have been made only after careful consideration of the best information obtainable. It is also evident that the various restrictions embodied in the order are not necessarily final; one amendment has already been issued, that of February 12, 1919, with reference to the use of sterilized soil about the roots of imported plants. It is, therefore, always possible that further convincing evidence may make other amendments necessary, not only for modifying or removing restrictions now in force, but also for extending existing restrictions or adding further prohibitions thereto.

"It is recognized that the enforcement of certain features of this quarantine order will injure some horticultural interests, not only by necessitating readjustments but by the possible loss of some lines of profit. Such provisions, however, have been inserted only because it was believed, on satisfactory evidence, that they were necessary in order to protect the wider interests of the public at large.

"It is also recognized that some of the plants and plant products, whose importation has made them more or less popular, will become rarities until they can be produced in this country and, if as seems likely in a few cases, this turns out to be impossible, that it will be necessary for the public to do without them or to accept a substitute which can be produced here or which can be imported with safety.

"In any discussion of the purpose and effect of this quarantine order, the fact should not be overlooked that definite provision is made therein for the entry, in limited quantities, even of the prohibited bulbs and plants, through the government office of foreign seed and plant introduction. In such case, the importation would be safeguarded by the highly developed quarantine and inspction service of the department and the country could, in this way, gradually be supplied with new varieties and the necessary stock for propagation, without the dangers attendant upon commercial importations.

"In view of the facts and considerations set forth, it is my opinion that Plant Quarantine 37 is scientific in origin and purpose, as well as sound in principle, and that its enforcement will make for the safety of the plant, fruit and forest interests of the country with as little injury to private agencies and individuals as is compatible therewith."

For Three Years Hudson Super-Sixes Have Led

Super-Six leadership was first established on the speedway. There it showed such performance and endurance as immediately placed it in the front as the greatest stock car that had ever attempted such feats.

But present Hudson leadership does not rest upon what it has done in establishing the best time for one hour, or for one hundred miles, or for its twenty-four hour performance, or for having made the best time in the greatest hill climb that was ever held, when it climbed to the top of Pike's Peak. The Super-Six is not distinguished because of any one notable performance, although it holds more such records than any other car.

There are seven Hudson models Two open and five closed The 7-Passenger Phaeton sells at $2200

The greatest proof of Hudson leadership is shown by the way in which 60,000 Super-Six owners are satisfied with their cars.

Acknowledged by all Rivals

Hudson body designs too are the standard of motordom.

Everyone in touch with motor car development knows how the Sedan, the Touring Limousine, the Speedster, the Cabriolet, the Limousine and the Town Car, models that first appeared on the Super-Six chassis, have served as patterns for other cars. Hudson owners always get the advance models.

Full production of Hudsons will not be reached before June. Until then buyers of open models will have to supply their wants from the limited stocks of those few dealers who may have such cars.

In almost every locality the Hudson Super-Six is not only the largest in number among fine cars, it is regarded as the fine car. In many sections it is the only fine car to be found.

ROEDING'S FRUIT GROWERS' GUIDE

"Roeding's Fruit Growers' Guide" by George C. Roeding, Fresno. $1.00.

"Fruit growing is a business pure and simple. It had a very important bearing on our winning the war. The purchases of dried fruits in California alone, exclusive of canned goods for the men who were at the front, aggregated $25,000,000 of the crop of 1918. Vegetables, canned and dried, formed another very important adjunct in the diet of our men, and the purchases ran up to millions of dollars. Intensity in farming operations is being encouraged now more than ever before. A man who planted fruit trees and intercropped with vegetables during the period of the war certainly fulfilled his obligation to the government. He not only provided for the future when he planted his orchard, and increased the value of his land, but in addition to this he was encouraged to go to the expense of installing a pumping plant for developing water, building ditches and, where necessary, cement pipe lines, with much more care and thoroughness than he would have done were he devoting his attention merely to the raising of vegetables alone. It is becoming more and more apparent in these days that a fruit grower should specialize. This does not means that a man living on a farm should not have a small or-

Mr. Farmer

If you grow Raisins, Prunes, Peaches, Pears, Apples, Apricots, Grapes, you need a

SAHARA DRIER:

Every year your losses run into thousands of dollars because of adverse weather conditions—over-ripe fruits, etc. The Sahara Drier guarantees you against such losses. It is the cheapest and best possible insurance for your crops. You cannot afford to take a chance on early rains such as came last Fall.

WINE GRAPES—Many of the California growers are making ready to dry their 1919 crop. We guarantee our machine to do satisfactory work. Our patented process makes this possible. Prices are $650 and $850 for our one-ton-per-day Drier. See our representatives for particulars:

chard, berries, vegetables, alfalfa, a cow, poultry and hogs. It is being demonstrated, however, that with our diversified climates and soils certain localities are better adapted to one variety of fruit than another. This point should never be lost sight of. There is far too great a tendency on the part of many people to plant the fruit which has been bringing the highest prices for several seasons, utterly disregarding the fact that both soil and climate may not be conducive to make the venture a success."

The above is the first paragraph of a book which is a valuable addition to every fruit grower's library. It's a discussion, or rather a very complete and practical statement such as should be made in the text of a fruit growers' guide.

After the statement as to beginnings, or as to the necessity for the fruit grower putting on his thinking cap, the book proceeds with preparation of soil, selection of stock, time of planting, treatment of trees when received, how to plant, discussion of planting methods, with number of trees per acre, etc., short discussion of planting; after this general discussion of planting and pruning of orchards and vineyards, then special treatment for apples, pears, cherries, plums and prunes, apricots; practically every fruit grown in California is taken up with short pungent suggestions of various steps in orchard making and orchard care and harvesting.

No table of contents is given but an excellent index aids one in turning quickly to a desired topic.

While the book contains only about 100 pages it has been given Roeding's direct punch, and in addition scores of illustrations teach faster than words the how of doing things. We have been able to find more direct and definite answers to California cultural questions than in any book yet issued.

There are some points on which without question some growers might disagree with Mr. Roeding, but the wise man who is able to write books acceptable to all growers has not yet risen. For instance, in the matter of pruning walnuts Mr. Roeding says: "Even if the trees are ten feet high (this in planting from nursery row) they should be cut back to three and a half feet from the ground after being set." We think perhaps Mr. Neff might take exception to some of the pruning hints, as perhaps some other walnut growers might do, but even here Mr. Roeding is able to fight his own battles.

PEACH CROP IN GOOD CONDITION

The condition about April 1 of the commercial peach crop was 84 per cent of the normal compared to the final percentage last year of 52.4, according to the bureau of crop estimates of the United States department of agriculture. No quantity estimates were given, but the bureau, assuming that adverse conditions do not affect the crop later, said that the April 1 condition report indicates that the 1919 peach crop may possibly exceed the very light crop of 20,546,000 bushels in 1918 by as much as 40 per cent, and may equal, if not exceed, the 28,901,000 bushel crop of 1917. Conditions generally throughout the peach regions are excellent, says the bureau, but emphasis is placed on the temporary nature of early peach reports.

PRODUCTION OF HONEY

Since good honey prices are assured for some time to come, beekeepers are justified in aiming at the best possible production for the coming summer. If colonies are in box hives or poor hives of any sort they deserve better treatment. Best results are only attained by using up-to-date appliances and methods. When fruit trees are in bloom it is a good time to transfer bees to modern hives, for at this time there is usually but little honey or brood in the combs to hinder operations. In most cases colonies appear to have sufficient stores this spring, which is all that is required for building up to good strength ready for the honey flow. In case stores are scarce, however, syrup of equal parts of sugar and water should be fed on warm days in sufficient quantities to keep the bees well supplied.

DAYS TO OBSERVE

These will be six busy days. You will see modern farming done the Power way. The newest devices for labor saving—for economical farming—will be in action.

Tractor DEMONSTRATION May 6 to 11

At Arden Acres

Tract of 650 Acres. Adjoining Country Club. Six Miles from Postoffice

Come prepared to stay. The demonstration of all the up-to-date machines will be of great interest. Tractors—Plows—Harrows and power farming accessories of every kind will be on exhibition. You will see tractors at work, doing exactly what they will do for you on your farm. You will see them pulling mould-board plows, disc plows, harrows, scrapers and all kinds of farm implements. Remember, there's nothing quite like seeing. At this demonstration there will be tractors to meet every demand for the big and little ranches, for the orchard, grove and vineyard, for hauling, for the pulley. COME.

Free Admission. Free Auto Parking. Free Camping Grounds Nearby. Excellent Restaurant Fully Equipped.

Cauliflower in the Season of 1918-1919

CAULIFLOWER is one of the most important winter vegetables grown in California and meets with very little competition in the Eastern markets from other producing districts during its marketing season. The only other section of the country where the commercial production of this crop has approached the output of California is Long Island, which ships during the fall months.

Los Angeles County is by far the most important producing section and practically the only other cauliflower shipped from this state is produced in San Mateo County, near San Francisco. Considerably more than 75 per cent of the crop each year is grown in Los Angeles County. Last season's acreage in Los Angeles County was 3450; in San Mateo, 1300.

In the season of 1916-17 there were shipped from this state 1654 carloads. In 1917-18, 2173 carloads were shipped and this past season of 1918-19 a total of 1594 cars were shipped. This movement extended from April to November.

The past two seasons have proven conclusively that the weather, in its influence on growing conditions, is the most important limiting factor in the cauliflower deal. In the 1917-18 season a combination of unfavorable weather and poor transportation resulted in the most disastrous season known, from the viewpoint both of the growers and shippers. This situation arose from the lack of rainfall through the late fall and extending up to February 1, a period during which the normal rainfall is over 11 inches. Conditions were made worse by severe drying winds which tended to retard the maturing of the crop, reduced the size of heads, and made the crop generally inferior for shipping. Last year heavy loading of cars, together with unavoidable delays in transit, owing to the poor rail facilities, resulted in the glutting of many markets with stock which had deteriorated in transit and which brought "red ink" returns to the growers.

The unfortunate season of 1917-18 resulted in a considerable decrease in plantings for the season 1918-19, as shown by the bureau of crop estimates figures, which indicate that the acreage this past season, in Los Angeles County, was 3450, as compared with 4800 in the season of 1917-18. The Japanese and Chinese growers, who produce a large proportion of the crop, planted about their usual acreage, but that planted by other growers was much less.

While the growing conditions this season were considerably better than last year, still there was a time during the month of February, when the crop matured so rapidly it could not be handled properly and, if transportation facilities had been as poor as last year, a great deal of this stock would have arrived in bad condition. Light rains the latter part of November, after the long, dry fall, gave a more promising outlook to the situation, but during December the nights were so cool that little growth could be made. After this long period of retarded growth the crop began to mature rapidly the latter part of January and heavy shipments commenced.

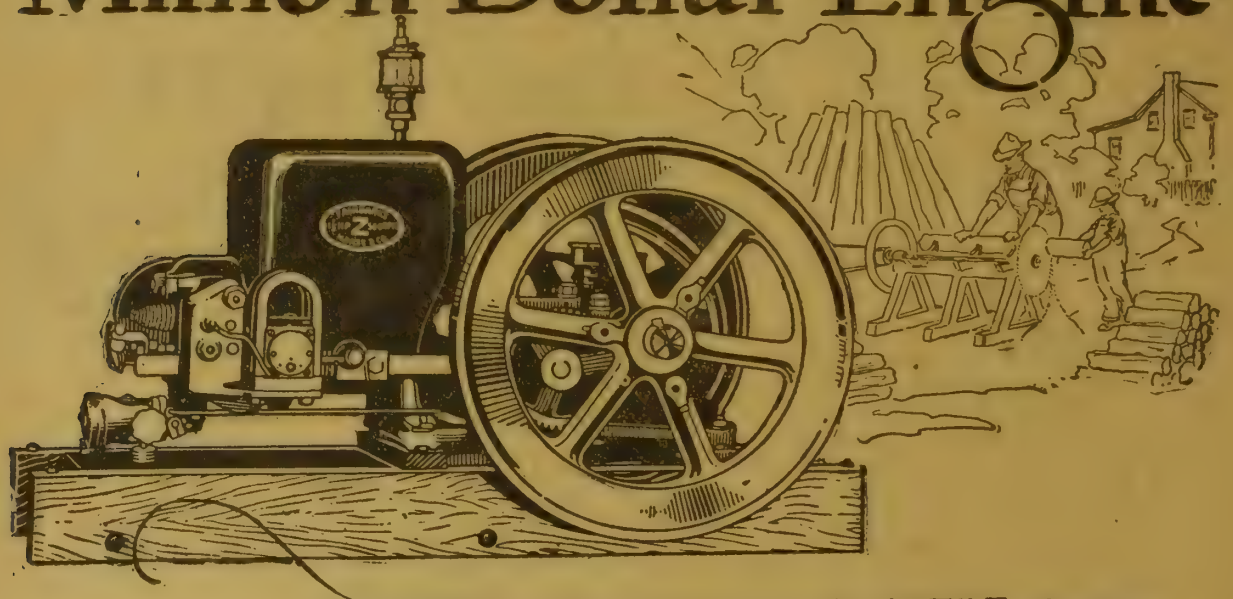
During the period of heaviest movement from the southern district many of the heads were loose and "ricey" and from some fields fully 50 per cent of the heads hauled to the packing sheds were turned back to the growers for delivery to pickling works. At this time only a small percentage of heads were hard, tight and well bleached. The main movement during this period was from what is known as the "Half Early" plantings, as the "Early" strains had gone forward largely in mixed cars. The so-called "Late" varieties did not mature uniformly this season and very little, if any, of this stock was shipped.

Prior to the 1917-18 season the heavy shipping period had been in the month of January, but last year and this the peak had been reached in the month of February and the crop matured fully a month to six weeks later than normal.

Cauliflower as produced in Los Angeles County presents an interesting contrast to the Broccoli type shipped from San Mateo County in the central district of this state. The Chinese, Japanese and American growers on the level, irrigated lands south of Los Angeles, practice decidedly different methods of growing the crop from those used by the Italian growers in the hill lands south of San Francisco. In this latter district the common varieties are known as Snowball cauliflower, White Broccoli and Black Broccoli, the latter type being the one of greatest commercial importance. Most of the planting in San Mateo County is done in June and July and transplanting in August and September.

The crop is usually grown without irrigation in the heavy soils in that region and in favorable seasons the per acre yield of Broccoli runs heavier than that of cauliflower in the Southern district, because of the cool, humid climate, heavy manuring and close planting. On the other hand, in dry years the acre yield is generally less than that secured in the Southern district because of the lack of irrigation.

In the 1917-18 season the yield of shipping stock in straight and mixed cars, exclusive of pickling stock and that consumed locally, was estimated to have been 173 crates per acre in Los Angeles County and only 150 crates per acre in San Mateo County. The figures on the per acre yield of the two districts for this season are not yet available. In the Central district the plants are commonly set about two feet apart each way, and each plant is watered by hand at the time it is set out, unless the soil has recently been moistened by rain. In harvesting, the heads are usually carried out to the ends of the rows by hand and packed on the ranch.



In Los Angeles County the planting season covers a long period, running from May 15 to September 1, in order to obtain the continued supply of matured heads throughout the winter months. Growers as a rule recognize the importance of supplying the Eastern markets continuously through the winter months, and in their efforts to produce a somewhat uniform daily supply they have developed several strains of seed, known as "Early," "Half Early" and "Late," which are planted at intervals of from two to three weeks apart.

Transplanting from the seed beds begins about July 15, and sometimes continues to as late as November 1. The plants are set about 20 by 34 inches apart in the field, and frequent irrigation is employed by the furrow method during the growing period. In harvesting the crop each plant is severed close to the ground with a long knife, the second stroke cutting off the main, outer leaves at the base, after which each head is tossed into a two-wheeled cart which is driven over two rows of plants. It is generally necessary to go over each field several times, as the individual heads mature irregularly. In the Southern district packing is seldom done on the farm, but the cauliflower is thrown from the field carts into large wagons or auto trucks and hauled to the packing houses.

Here the heads are tossed on the end of a long conveyor about four feet wide, which moves slowly and carries them to the packers who stand at either side. Inspectors at the receiving end of the conveyor examine each head carefully and, if the stock is loose and "ricey", it is thrown aside, to be taken back by the grower. Generally each load is considered a lot by itself, and the grower is paid for the number of crates actually packed.

The heads are packed 9's, 12's and 15's in flat pony crates, measuring 8½ by 18 by 25½ on the outside and which are designed to hold one dozen standard size heads. In packing, the lower part of the leaves are left attached to the head and the tips of the leaves are cut off even with the top of the crate before the lid is nailed on. The standard cauliflower crate measures 13 by 18 by 25 inches, and is designed to hold two dozen standard sized heads. A standard carload consists of about 500 pony crates, or 285 standard crates. In some cases, certain markets prefer heads wrapped in paper, from which the leaves have been trimmed.

A New Fifteen Million Dollar Engine

FIFTEEN million dollars worth of "Z" Engines are on over 200,000 farms—proving a remarkable engine service. The new 1½ H. P. "Z"—just perfected—completes a line of KEROSENE engines—1½ H. P. to 15 H. P.—all of which merit the keenest interest of every farmer. The rare combination of scientific design—fool-proof construction—efficient operation—lowest possible fuel cost—certainly establishes the supremacy of the "Z". Go to your dealer—see the "Z"—then you'll quickly learn why progressive dealers feature the "Z" line after comparing it with all others.

Successful Farming thru the Ball Tread

Putting the Rollers under the Drudgery in Farming

There are three sizes of these
Roller-Bearing, Work-Achieving, Money-Making
Yuba Tractors: 12-20, 20-35, 40-70
Ready for Immediate Delivery

Power farming is the modern business idea. The resistance of hard soils, the long field, the weary round, drive you toward the use of power on the farm.

The machine best adapted to hard usage, *the one that puts the rollers under the drudgery on the farm,* is the YUBA Ball Tread Tractor.

Riding your YUBA you feel a sense of security. You are sure you will arrive at the end of the day without breakdown. You know that the mechanical perfection of your YUBA is your best guarantee of long service, few repairs, small upkeep.

Perhaps the only argument against the YUBA is the price. But that affords YUBA perfection.

Write for the catalogue. Tell us how many acres you farm, or what uses you expect to have for a tractor.

Arizona Farmers Eat Alfalfa

By M. E. Bemis

IT IS rather an old story, that of the jury that could not agree and the foreman told the court bailiff to bring around dinners for eleven and a bale of hay, but when 300 Arizona farmers and business men with their wives sat down with the governor of the state to an alfalfa dinner, something new as well as unique was pulled off in the state that is so full of surprises that it is called "The Wonderland of America." There are more than seven wonders in Arizona, but alfalfa is one of the greatest and almost the least talked of.

The following menu comprised the "feed":

Alfalfa Noodle Soup
Alfalfa Croutons
Sandwiches
Alfalfa Bread
Alfalfa Fed Cold Meats
Alf-ine Jello
Alfalfa Coffe Alfalfa Tea
Alfalfa Muffins
Alfalfa Layer Cake Alfalfa Syrup
Alf-ine Ice Cream
Alf-ine After-Dinner Mints
Alf-ine Assorted Candy
Alf-ine Chaser

Although the governor facetiously remarked that a friend sat beside him all the evening with his knife out in case he should "get bloat", there were no casualties and few complaints, though possibly as a steady diet few would be enthusiastic.

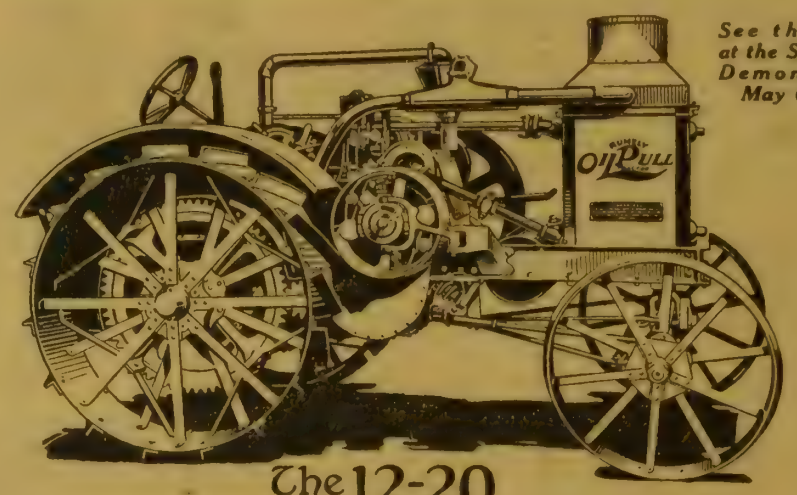
This alfalfa dinner was merely the closing event of a most important occasion, a real Hay Congress, composed of producers of and dealers in hay, which in Arizona means alfalfa. 85 times—or tons—out of 100.

Several months ago the dealers organized, and then it was found that the dealers' problems involved the producers' and the shippers' troubles as well, and the Hay Congress which convened in Phoenix April 7 was the gradual outgrowth of conditions that made it advisable to get together for the good of all concerned.

Arizona Hay "Feed"

Banquet of Arizona hay makers. Gentleman sitting slightly at right of center of picture with the figure "1" on his shoulder is Governor Campbell; on his left, "2" is Senator C. C. Greene, president of the Arizona Hay Dealers' Association; "3" is Dr. Bower who planned the banquet.

One of the big things that it was felt necessary to put across was the adoption of a standard for hay. Up until the government regulations under the food administration there was little attempt to grade hay in Arizona. To be sure, one could buy grain hay but this might be either barley or wheat, and alfalfa hay might be first cutting, fifth cutting or anywhere in between; it might be fine or coarse and it might be pure alfalfa or it might contain considerable weeds. Government requirements compelled the establishment of a standard, and J. M. Jaggers was appointed by the state food administration to look after this feature of their work.



Shortly after his appointment he organized the hay dealers, and it was through this association of hay dealers that the Hay Congress was called.

At the morning session of the congress, after reciting conditions which led up to the organization of the hay dealers, Secretary Jaggers said:

"The inspection of hay at point of origin with the support and cooperation of the inspector and producer, I believe, is one of the principal avenues through which Arizona hay will be placed on the market again at par. I am of the firm opinion that this inspection bureau has the heart cooperation of those who desire that their commodity should be handled upon its merits. We see no serious objection to the inspection of hay at point of origin, but much good has been accomplished by such an arrangement. The inspection bureau was forced upon you by our government through the United States food administration when, by an investigation, it was found that scores of cars were lying idle on spurs, switches and in railroad yards at various points in our markets, the contents refused by reason of inferior grades. And in addition to this condition numerous complaints were being filed with the government from the actual consumer who was in pressing need of hay and unable to pay the enormous war-time prices for the inferior grades of hay. I am sorry that it is impossible to bring forth the files which contain reports from your markets with respect to Arizona hay for October and November of last year, prior to the establishment of the inspection bureau at point of origin, but, for your information, may I not assure you that these condition do not exist today and neither is there a huge sum of money of from seventy-five to one hundred thousand dollars due to the producer from the local dealers of the valley for rejected and inferior grades of hay."

The congress agreed that the uniform size of bales should be 75 pounds. Congressman Carl Hayden with reference to the problem of freight rates, said:

"In case the railroads are returned to private ownership, as seems likely to happen in the near future, the interstate commerce commission will probably be given power to make freight rates and regulate issues of railroad stocks and bonds so that there will have no excuse for raising rates. The railroad has been getting a big share of the hay man's profits. A few years ago hay opened here at $4.00 a ton. In California the price was kept advancing until it reached the then almost incredible price of $25 a ton. Valley hay men kept shipping to California but did they get the advantage of the high prices and make a fortune out of them? Not at all.

See the OilPull at the Sacramento Demonstration May 6th-11th

Capacity — Pulls three plows—operates 22-inch thresher.

Fuel—Guaranteed to burn Kerosene successfully under all conditions.

Cooling — Oil cooled—no evaporation—non-freezing.

Motor — Heavy duty, 2 cylinder 6 in. x 8 in.—560 R. P. M.

Crankshaft — Built to U. S. Naval Specifications.

Frame—Hot riveted steel members—no bends—no splices.

Transmission — Cut steel gears, enclosed and running in oil.

Bearings—Hyatt roller bearings in transmission and rear axle.

Governor — Fly ball throttling type—automatic speed regulation.

Belt Pulley—19 inch diameter—running directly off crankshaft—no intermediate gears.

Lubrication — Force feed and splash.

Speeds—Two forward—one reverse.

Drawbar—Adjustable spring drawbar.

BACKED BY WRITTEN GUARANTEE — OilPull — ADVANCE-RUMELY

A New OilPull in a 3 Plow Size

"Build us an OilPull in a 3-plow size."

That was the call from farmers everywhere—and the 12-20 is our answer—the latest and smallest of the OilPull line, an all purpose outfit built on the proved OilPull design and construction.

Into the 12-20 are built all the features that during the past ten years have established the unequalled OilPull record for economical, dependable operation and long life—plus those improvements that only long experience can teach.

Like all sizes of the OilPull the 12-20 is backed by a written guarantee to burn successfully all grades of Kerosene under all conditions, at all loads to its full rated brake horsepower.

In the 12-20 the weight distribution is absolutely correct—no danger of turning over, or the front wheels raising off the ground. The 12-20 "stays put" on rolling land as well as level.

The 12-20 is a light weight, big power outfit—its rating based upon only 80% of its maximum efficiency—a 20% reserve power when you need it.

The 12-20 is oil cooled, which means that the radiator will not freeze in the coldest weather nor boil in the hottest—that it will go indefinitely without refilling—that instead of clogging the circulating system with sediment it keeps it always open—that instead of rusting the cooling system parts, the oil preserves the metal. The OilPull cooling system eliminates a cooling fan—it keeps the motor at the right temperature at all loads. The harder the OilPull works—the cooler it runs.

All transmission gears are cut gears—all shafting and parts such as the cylinder, piston, rings, etc., are ground to the thousandth part of an inch—a guarantee of a perfect fit and greatest efficiency. The OilPull is built complete in Advance-Rumely shops.

The 12-20 is as efficient on the belt as on the drawbar. The belt pulley is just where it ought to be, on the right hand side, up within full view of the operator. The 12-20 can be lined up with a belt machine, backed into the belt and the belt started and stopped from the platform. The belt pulley is driven direct off the crankshaft—no loss of power. The band wheel is extra large and by driving through a cross belt allows the use of a looser belt.

The 12-20 will pull three 14-inch bottoms under average conditions, operate a 22-inch thresher fully equipped, and handle all the various drawbar and belt power jobs.

All OilPull tractors are not only backed by a guarantee that assures you the most economical operation—they are also backed by an organization big enough to guarantee you efficient service at all times. Advance-Rumely maintains 27 branch offices and warehouses.

Ask for the catalog describing this new 3-plow OilPull.

ADVANCE-RUMELY

Sulphur

It has been proven and so recommended by the University of California that if you sulphur your grape vines and orchards SIX times they will not be affected by MILDEW or RED SPIDERS.

ANCHOR Brand Velvet Flowers of sulphur, also EAGLE Brand, Fleur de Soufre, packed in double sacks, are the fluffiest and PUREST sulphurs that money can buy; the best for vineyards; the best for bleaching purposes, LEAVING NO ASH.

VENTILATED Sublimed Sulphur—Impalpable Powder, 100 per cent pure, in double sacks, for Dry Dusting and making Paste—(Atomic Sulphur).

For LIME-SULPHUR SOLUTION, use our DIAMOND "S" BRAND REFINED FLOUR SULPHUR. We can furnish you this sulphur at such a low price that it would pay you to mix your own solution and net you a profit equal to the amount paid out for labor in spraying your orchard, even if you pay your men $4 per day for making the solution and applying same.

To create additional available plant food, drill into the soil 100 to 400 pounds per acre DIAMOND "S" BRAND POWDERED SULPHUR, 100 per cent pure. This has increased various crops up to 500 per cent.

Also PREPARED DRY DUSTING MATERIALS, Tobacco Dust, Dry Bordeaux, Dusting Sulphur Mixtures, etc.

And "Anchor" Brand Standard LIME-SULPHUR SOLUTION 33 DEGREES BE., Sulphur Paste, Nicotine, Blackleaf 40, etc. Fungicides and Insecticides.

Carried in stock and mixed to order.

San Francisco Sulphur Co.

624 California St. San Francisco, Calif.

We are equipped to make immediate shipments. Send for "ILLUSTRATED BOOKLET"; also booklet "NEW USES FOR SULPHUR", Price-list, and Samples.

Please state for what purpose you use the sulphur, quantity needed, and date of shipment preferred. Telephone Kearny 871.

ARCADIAN

Sulphate of Ammonia

Truck crops respond readily to an application of Arcadian Sulphate of Ammonia. Use 100 to 300 pounds per acre followed by a good irrigation.

Arcadian Sulphate of Ammonia is the well-known standard article that has done you good service in your mixed fertilizers for years past. Especially kiln-dried and ground to make it fine and dry. Ammonia 25¼ per cent. Made in U. S. A. Arcadian is the great American Ammoniate.

Correspondence with the advertisers in the California Cultivator will convince you that their articles will save you money.

"With each rise in the price of hay in California the railroads raised the rates. They probably did it out of charity, thinking that a sudden influx of wealth into the valley might be very bad for the farmers."

The congress went on record as being in favor of the "Producers' Organization", and a movement is now under way for just such an association. It is entirely fitting that Arizona should have a strong organization of alfalfa growers. In many of the Middle Western states where alfalfa has not the same relative importance that it has to Arizona farmers there are organizations of growers who cooperate for mutual interest, not alone in the matter of handling the product but in exchanging views as to the best methods of cultivation, harvesting and marketing.

About 85 per cent of all the hay producers in Arizona, according to the estimates of L. M. Harrison, field agent for Arizona, United States bureau of crop estimates, is alfalfa. New York, with an acreage of 4,300,000 acres devoted to hay and producing nearly five and one-half million tons, has only 83,461 acres devoted to alfalfa, and the production is 2.6 tons per acre with a total of 217,000 tons. Nebraska leads the country in alfalfa production, having 562,530 acres in this crop. The acreage in California is 214,300; the average yield is 5.3 tons, which is the largest yield per acre of any state in the Union. Arizona has approximately 125,000 acres devoted to alfalfa, this in spite of the fact that the acreage of cotton has more than doubled, only 8000 acres less than in 1917 and the total production is nearly a half million tons, in addition to considerable pasturage.

About one-fourth of the entire acreage of the irrigated land of the state of Arizona is in alfalfa, hence the importance to the farmers of Arizona of any organization whose purpose is to cooperate in such a way as to secure better crops, place them on the markets in the best possible condition and in shape to command the highest market price and to so cooperate with the hay dealers as to secure their fair share of the actual net returns and to obtain the lowest possible freight rates.

GET READY

The agricultural department of the Sperry Flour Company is recommending:

"The beginning of the new crop season will find California's warehouses and mills with a very short supply of old grain and there will be a ready market for growers who are in a position to harvest and deliver their wheat early. As the season advances this demand will decrease.

"There is a considerable acreage of Early Baart wheat planted this year which will ripen about as early as barley. Now is the time to commence to get harvester and machinery in shape in order to take care of the crop as soon as it ripens. This preparedness will save a certain percentage of loss which always occurs in any variety of wheat if it is not harvested as soon as it is ready, and will enable marketing wheat when the demand is greatest.

"When harvesting remove all screenings possible. It is surprising what can be accomplished in this direction with a little care. It's expensive to pay freight and other handling charges on screenings contained in wheat, but much can be fed to good advantage at home. Just figure up what it would cost to harvest and get to the mills 10 per cent of the screenings in wheat.

"In the 1918 wheat crop screenings ran from one per cent to as high as 25 per cent. Part of these were usable, but a very large percentage was a total loss. The mills found that a considerable loss of wheat was sustained in separating usable screenings, such as barley and oats, and also in removing cheat. Again, in washing smutty wheat some light wheat was inevitably carried off.

"For these reasons it is unlikely that the mills will make the arbitrary allowance paid last year for usable screenings. It will pay every grower to send his wheat to the mills in the cleanest possible condition."

Advantages of Tractors

Several hundred tractor owners in the Dakotas were asked these questions:

"What do you find the principal advantages of the tractor for farm work?"

"What are its principal disadvantages?"

The replies have been summarized in Farmers' Bulletin 1035, just published by the department of agriculture.

Saving in time, making it possible to cover the desired acreage within the proper season, is put first among the advantages by a large percentage of the farmers. Other advantages mentioned are:

Ability to do thorough work, especially in hot weather, when horses are at a disadvantage.

Saving in man labor, doing away with more or less hired labor and enabling one man to farm a larger acreage than he can with horses.

Economy.

This last advantage is mentioned by a larger percentage of Dakota farmers than of farmers in other states where similar investigations of the tractor have been made. This is doubtless because the cropping system followed in the Dakotas is such that the tractor can be used to advantage for more of the farm work than in most other parts of the country.

The principal disadvantage of the tractor, according to the reports made by these farmers, is its injurious effect on moist soil. This difficulty is a serious one in districts where the soil is heavy and where it is necessary to do a considerable amount of work in early spring.

Difficulty of operation seems to rank next as a disadvantage. A large percentage of farmers emphasize it. Other disadvantages mentioned are expense of operation, undue increase in investment, and delays on account of engine trouble.

In comparing the reports upon which this bulletin is based with those obtained from tractor owners in various parts of the corn belt several years ago it appears that less stress is laid upon the disadvantages of the tractor in the recent reports than in the older ones.

PAINTING ADOBE

Due to the absorption of moisture by cement plaster and the unequal expansion of cement and adobe and the accumulation of air between cement plastered coats and adobe, cement plastered on adobe walls does not hold. It is readily noticeable that where an adobe house has been plastered with cement plaster and exposed to the weather for a year, and sometimes less, the plastered coat has begun to fall off. Instead of plastering the outside with cement a much better and cheaper method is to plaster the wall smooth with adobe mud and when dry put on a good coat of crude oil. After the oil has well soaked into the wall and somewhat dried on surface, which will take from one to three months, give the wall a coat of oil and lead paint of whatever color is desired; the non-fading colors, such as black, gray and white, are generally to be preferred. Crude oil, such as used in railway engines and which costs from four to five cents per gallon, is the kind to use for the first oil coating on the adobe wall. This can be either sprayed on or put on with a large roof paint brush. One gallon will cover from 80 to 100 square feet. Several farmers in Cochise County have used this finish for adobe houses and find that it is excellent. A correspondent reports that he has used it for inside finish on adobe wall and finds that it is better and cheaper than cement plaster. The oil and paint will not slough off, the wall will last longer and look even better than when plastered.—A. L. Paschall, Farm Adviser for Cochise County.

THE NEW

Studebaker

CARS

—why they are a good investment

Because:

—there are three new models—a car to answer every buyer's requirements.

—Studebaker quality, dominant for 67 years, is reflected in these new cars.

—they are beautiful in design, thoroughly modern and mechanically right.

—over 300,000 Studebaker Cars in actual service in every part of the world have contributed experience to the designing and building of the New Studebaker Cars.

—experimental models of each new car were given a gruelling factory test of 40,000 miles, over the roughest roads of Canada and the United States.

—they are daily proving their mechanical excellence in the hands of thousands of enthusiastic owners everywhere.

—Studebaker has put into each new car the most careful and experienced workmanship and the best materials money can buy.

—the motor of each new car gets the utmost from every gallon of fuel consumed, due to especially designed carburetor and a scientifically designed hot-spot intake manifold.

—uniform distribution of weight over the entire chassis insures unusually high tire mileage.

Because:

—Studebaker uses genuine leather in its upholstery.

—24 distinct paint and varnish operations insure a beautiful and permanent body finish, impervious to changing weather conditions.

—remarkable accessibillity permits inspection, adjustment or repair with little effort or loss of time.

—Studebaker manufactures completely in its own plants its bodies, axles, motors, transmissions, steering gears, springs, tops, fenders, and cuts its own gears and other vital parts, thus eliminating middlemen's profits.

—Studebaker maintains what are probably the most complete laboratories in the automobile industry for the development and the proving of materials used in the New Studebaker Cars.

These are but a few of the many very good reasons for Studebaker value—why Studebaker can and does produce cars of sterling high quality at low prices. If real economy is your consideration—if you want to get the most for your mouey—investigate the New Studebaker Cars before you buy. And if you purchase your motor car on the same basis as you do your blooded stock or a piece of farm machinery—as an investment—then Studebaker should be your first choice.

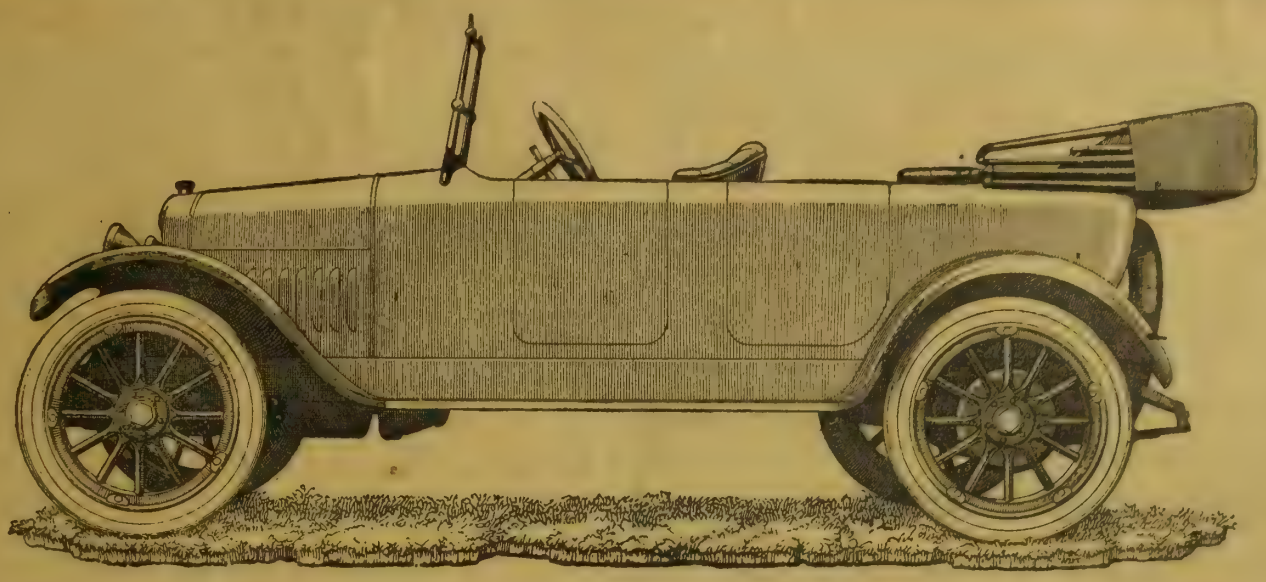
PYRETHRUM SHOULD BE SEALED

Insect powders containing pyrethrum will retain their effectiveness for months if kept in sealed containers, but if left exposed to heat and moisture they will lose their power to kill insects within a few weeks. This is brought out in tests recently completed by entomologists of the United States department of agriculture, a report of which has been published in the department's bulletin 771. Pyrethrum both whole and ground was kept for various periods under a variety of conditions, and then tested for effectiveness in two different ways: By dusting the powder on small potted nasturtium plants heavily infested with aphids, and by dropping croton bugs into a glass jar containing a small amount of the pyrethrum powder to be tested, and shaking the jar so as to cover them thoroughly with the powder.

It was found that the ground flower heads kept in tightly closed glass containers for five and a half years lost practically all their effectiveness, while the whole flower heads kept in similar containers for the same period were almost unhurt. Both whole and ground flower heads kept in sealed fruit jars for 150 weeks were not injured. When exposed for 34 weeks in an open dish in a room, ground pyrethrum was not injured, but its effectiveness was materially reduced by an exposure of 136 weeks and it was practically worthless at the end of 150 weeks. When exposed to the weather for 21 weeks both the whole and ground heads were greatly reduced in efficiency.



THE USE OF FERTILIZERS

California is a land of rich soil, so rich in fact that "Manure is poison to California soil," and when that was, stable manure was hauled to the highways and used to keep down the dust and to hold drifting sand. "Them was the good old days" in California road improvement. We build roads and productive fields along different lines today and smile at former methods, but we are still a little bit shy on the amount of fertilizer added to our soils.

Here is a report from the Monthly Crop Reporter of the department of agriculture, in which reference is made to the fact that far more fertilizer is being used this season than last, and we note that California is not even in the "also present" class. Use of fertilizer in the various states is tabulated by the department as follows:

	Fertilizer per acre where used—pounds.			Value of fertilizer per acre.
	1917	1916	Usual year	1917
Virginia	400	290	330	$7.30
North Carolina	400	303	397	6.25
South Carolina	350	270	410	5.00
Georgia	225	198	253	3.60
Florida	200	160	230	3.00
Alabama	175	180	250	2.50
Mississippi	180	170	219	2.40
Louisiana	200	185	210	2.60
Texas	160	.....	.....	2.25
Arkansas	160	163	185	2.50
Tennessee	190	175	186	2.40

The San Joaquin Valley Dairymen's Association held a convention in Porterville April 15.

The movement to better Cars in which Maxwell shares

OBSERVATIONS recently made among farmers show a marked tendency to buy better automobiles. They want a little more luxury, and at the same time don't care to waive the consideration of economy.

For a motor car to a farmer is a piece of time-saving, comfort-giving, dollar-saving machinery.

Hence the tendency toward Maxwell has a good reason behind it.

For this car has not only a self starter, and demountable rims, but other points of luxury that make it popular on the boulevards of the big cities.

Still it is not a "boulevard" car. For it is built to stand the gaff of rough and ready use, good roads and bad, mud and concrete, a trail as well as asphalt.

It is built to be everlastingly reliable. And that is how reliability has come to be its middle name.

Five years ago a very simple chassis was designed. Simple so that it would be easy to build, easy to run, free from trouble; and simple so that it would have no "grand opera moods."

Today 300,000 Maxwells have been built on this original chassis plan. More than 1000 improvements have been made; but never one single radical change in design.

There is scarcely a greater business monument to the policy of doing one thing and doing it well than the product of the Maxwell Motor Company.

It saves you money three ways and returns you a sum of satisfaction on which you can draw interest for 100,000 miles.

Questions and Answers

ANSWERS BY EDITOR AND STAFF

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Turkeys—Poor Hatch

I have been raising bronze turkeys for four years and this spring bought a prize yearling tom at the poultry show and mated him to my three year old hen. I set six and am getting very poor hatches. The last I waited two days over time and then broke the eggs. There were 12 perfect turkeys but none had life enough to live more than two or three days. Yesterday another should have hatched and this morning I broke two. The skin inside seems dry but I sprinkled twice and the night before hatching time put the eggs in warm water. As soon as I broke the skin the blood ran. I have dipped them again but have not much hopes that they will hatch. The turkeys set on the ground and I have houses I put over them. We have had so much rain it seems impossible it could be lack of moisture. Can you suggest anything?—Subscriber, Saugus.

The slowness of the eggs to hatch would seem to indicate that they were too old before incubation was commenced. The sooner after they are laid turkey eggs are put under the hen the better they hatch. Turkey eggs require a good deal of moisture. A turkey expert with whom I talked recently sets hers on the ground, making the nest quite moist, and then sprinkles the ground around it occasionally during incubation. On the 24th day she sprinkles the eggs with warm water. This is the only sprinkling she gives them. It is possible, of course, that some lack of vigor in the parent stock is responsible for the apparent weakness of the poults, but if your male is a prize bird I would sooner think it due to the age of the eggs. Moisture conditions should not make very much difference in such a cool season as this. Next time sprinkle the eggs the 24th day and then leave them alone until you are sure they are not going to hatch, even if they should be late. The two dippings may have injured the second lot.—J. A. K.

Bean Rust

I have been troubled with bean rust on pole beans. I have tried sulphur, arsenate of lead, etc., with no effect. Could you suggest some effective cure, as I am anxious to curb this disease? —Subscriber, Santa Ysabel.

Your dry sulphur should prove successful with this trouble. The warmer sun of the present will probably make this remedy more effective. Bear in mind, rust which is already in evidence will not be removed, but its spread may be largely prevented by light powdering of high grade of sulphur. Do not attempt to do this work with a cheap grade. The arsenate of lead would have no effect on the rust.

Spraying on Bloom

Would spraying on orange grove for red spider when it is in full bloom injure the bloom or interfere with the setting of the crops?—Subscriber, Glendora.

Growers of apricots, peaches and some other fruits always regret to see even a light sprinkle when trees are in full bloom. This seems to seriously affect pollenization and bring a lighter crop. With oranges, specially with navels, however, growers usually prefer to spray with lime-sulphur whenever it is needed. There is a wider range of blooming period, and in any case some growers believe that the lime-sulphur is beneficial in preventing action of the fungus which specialists maintain is cause or partial cause of the June drop.

Immediate mail replies cannot be given except where fee to Mr. Stanton is paid. When replies are wished in Cultivator address query to 115½ N. Broadway, Los Angeles.

Tuberculin Test

Would a farmer who keeps three or four cows and makes butter for customers on a small scale have to have his cows tested for tuberculosis? If so, whom does he notify to have this test done?—Subscriber, Roosevelt.

Under the act to prevent the sale of impure and unwholesome milk, it is provided that it is unlawful for anyone to sell for human consumption, except to manufacturers of food stuffs only, the butter produced from milk from cows which have not passed the tuberculin test until it has been pasteurized. Butter offered for sale must be marked "From non-reacting tuberculin tested cows" or "Pasteurized" or "For cooking and baking only". The act provides for the establishment of local inspecting departments throughout the state, and further provides that any dairyman not operating under such inspecting department, who desires to sell milk, may file with the state veterinarian a written request that his cows be tuberculin tested. After the filing of such request the dairyman can operate and sell milk until such time as the state veterinarian shall be able to make the required test.

Storm Water Diverted

A and B have adjoining ranches with county road between. A has dug a deep ditch at the base of a hill to gather the run-off of storm water. This ditch collects all the run-off from the hill, turns it from its natural course and empties it at the high point of a low ridge on the county road. The stream thus produced crosses into B's land and is starting to cut away the soil. B's land is set with 18 year old Valencia oranges, is light soil and cuts away. Can A be made to fill the ditch and return the water to its natural channel, and can B collect damages for injury done?—Subscriber, El Cajon.

It is the settled law of this state that a land owner cannot protect his own land to injury of another's land by turning the storm or surface water, which would naturally flow thereon, away from his own and into the lands of another. Unquestionably if the water has been diverted from its natural course by A and B has suffered any damage therefrom, he can recover for such damage as has been suffered and enjoin A from maintaining the ditch, and require this ditch to be filled up and the water restored to its former natural course.

"I Began Right"

GOING to the root of the matter—the seed bed from which the roots take their food—you get at the principal source of crop success or failure. That's why a wide awake farmer, when asked the secret of his bumper crop, pointed to his International disk harrow and said, "I began right. I built up, not down."

No matter how rich your soil, you cannot expect big yields unless you give your seed bed a square deal. Get a good disk harrow—one built by men who know every angle of the business through long experience and study. You have too much at stake to buy an experiment.

The 1919 International line of disk harrows is the most complete we have ever offered. You know your soil. Whatever its needs, we have the type of disk harrow suited to them. If a sandy, loose loam, the two-lever type answers every requirement. If hard, stony, or trashy ground, the three-lever type, with its center depth regulator, insures a firm, compact seed bed. If you use a tractor, see our leverless tractor disk. Whatever your power equipment, we have a size that utilizes it to best advantage. Ask your local dealer to point out to you the exclusive features of each type.

Every implement in this line is built to serve fully some particular farm purpose, to save your labor and time, and make you money. The line includes open end, closed end, and flexible peg-tooth harrows, spring-tooth harrows with single and double end teeth, and one-horse cultivators with every kind of tooth and shovel equipment.

Check over the list of machines in this advertisement and write us for full particulars about any that may interest you. We will, on request, supply you with a catalog, showing full details of construction and operation.

Bitter Butter

Please tell us what to do for a cow whose cream makes bitter butter. She is fed bran, beet pulp and alfalfa. She is kept in a barn. The milk and cream are good and have no bitter taste.—Subscriber, San Dimas.

You say that the milk and cream are not bitter so the trouble must be with the handling of the cream and not with the cow. If the cream is allowed to stand too long before churning and more cream added from day to day it is apt to make bitter butter. Also milk and cream set in open pans will absorb odors from vegetables or any other substance that may be near. In a damp place cream will start a mould on top and while hardly noticeable it will make the butter taste bitter. All utensils used in making butter should be thoroughly sterlized and the cream kept only long enough to be well soured.

Cow With Diarrhoea

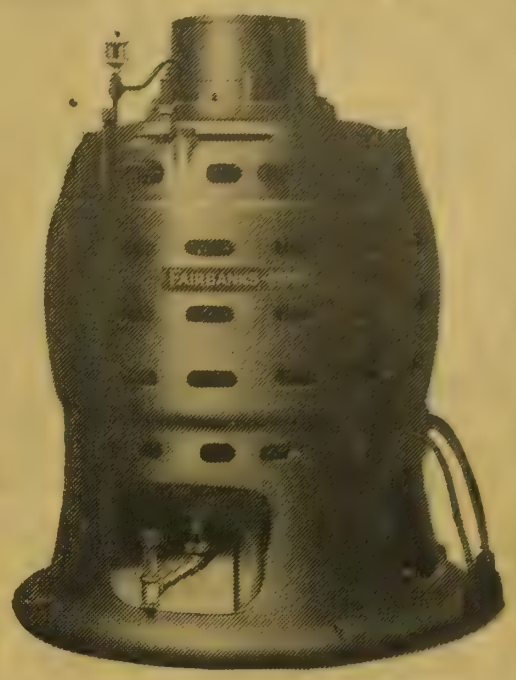
We have a cow that has a running off from the bowels. She was on pasture until about two months ago and has since been staked on green alfalfa. She is giving milk.—Subscriber, San Dimas.

So many things may cause diarrheoa that it is difficult to guess what may be the cause in this case. See that the drinking water is right and that no spoiled feed is given. Try this: Four ounces of powdered gentian, two ounces of salicylate of soda, two drams of tannic acid and six ounces of corn meal. Mix and divide into 12 powders. Give one powder in the feed once a day.

Milk Stopped

We have a fine Jersey cow that we let go dry six weeks before she came fresh. She has the best of feed, is in fine condition and seems to be in the best of health. She gave birth to a calf about a week ago but is giving no milk. Can you tell us the cause and the remedy?—Subscriber, San Fernando.

This is one of those cases that can not be accounted for. Feed her sloppy feed and at the regular milking time rub the udder and pull at the teats as though milking. By keeping this up regularly you will probably get the milk started and in a short time be getting a fair amount. The more rubbing and milking you do the sooner the flow will start. Sometimes this fails and we have to give it up.



Lambs Ailing

I have several lambs that I wish some advice about. There are both ewes and wethers weighing from 60 to 70 pounds and between three and four months old. Their trouble started by showing weakness in the hind legs and gradually getting worse until they are unable to get up or stand. They eat and drink well. A neighbor dissected one and found the kidneys and liver in good condition but the muscles of the legs appeared blue. What can be done for them?—Subscriber, Wasco.

The symptoms you describe are not common with sheep. At this time of the year they need a bitter tonic. Give each one five grains of aloin and five grains of powdered nux vomica. Mix it with a tablespoon of raw linseed oil. Repeat this once a day until it acts as a physic. Change the feed as there may be a weed in the hay that is causing part of the trouble.

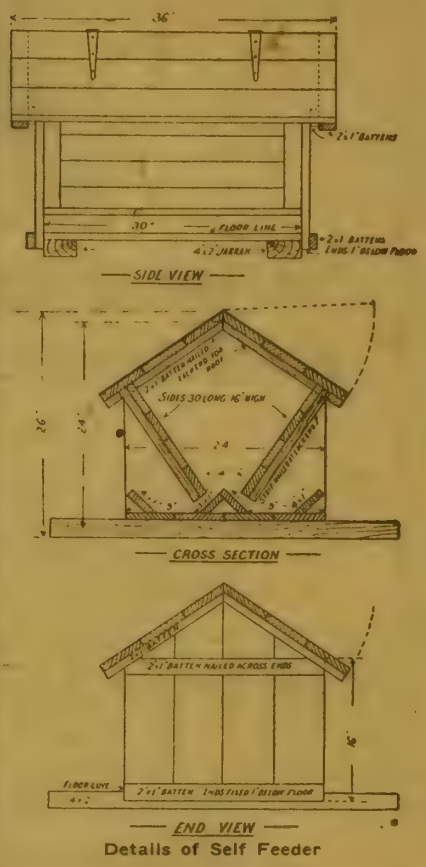
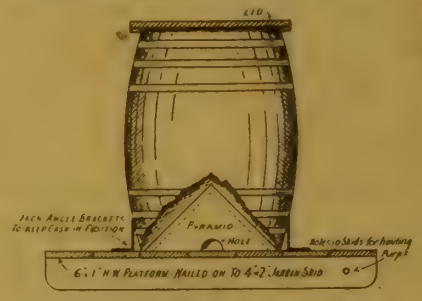
THE SELF-OILING WINDMILL
has become so popular in its first four years that thousands have been called for to replace, on their old towers, other makes of mills, and to replace, at small cost, the gearing of the earlier Aermotors, making them self-oiling. Its enclosed motor keeps in the oil and keeps out dust and rain. The Splash Oiling System constantly floods every bearing with oil, preventing wear and enabling the mill to pump in the lightest breeze. The oil supply is renewed once a year. Double Gears are used, each carrying half the load.



We make Gasoline Engines, Pumps, Tanks, Water Supply Goods and Steel Frame Saws.
Write AERMOTOR CO., 2500 Twelfth St., Chicago

Automatic Feeders for Pigs

THE Journal of Agriculture of Victoria, Australia, suggests a method of construction of self feeders, one of which, as will be noted by the engravings, is a barrel adapted by the construction of a simple pyramid with holes about the lower end of the barrel. It seems to us that the construction may be somewhat simplified, but from this suggestion California talent and materials may evolve a satisfactory hog yard appliance. The suggestion was originally made by R. T. Archer, senior dairy inspector of Victoria. Of course, jarrah, which is one of the eucalyptus family, may not be had in California, but Oregon pine, while not so durable, will answer well. The Journal says:



The illustrations show self feeders for pigs. The feeder is 30 inches long,

Details of Self Feeder

24 inches wide, and 26 inches from the peak of the roof to the ground. One-inch hardwood boards should be used, except for two sleepers of jarrah, two by four inches, placed beneath to prevent the feeder being upset, and to keep it off the ground. Ends, sides, floor and roof can be made separately and pieced together. Each roof slope is 36 inches by 18 inches. For a slope three six-inch by one-inch boards three feet long are held together by nailing two-inch by one-inch strips 18 inches long across each end. The ends are 24 inches wide, 16 inches high at each side and 24 inches high at the peak. Take six-inch by one-inch boards two feet long, nail a two-foot strip two inches by one inch two feet long, nail a two-foot strip two inches by one inch across one end and another across the boards 16 inches higher. Measure 24 inches in the middle and 16 inches on each side from the end with the strip. Draw a line from the 16-inch mark on each side to the 24-inch mark in the middle, and saw along these lines to make the ends the proper shape. The sides are 30 inches long and 16 inches high. For each side take four four-inch by one-inch hardwood 30 inches long and nail a two-inch by one-inch strip across each end. The floor is 24 inches wide and 30 inches long, and may be made by nailing four six-inch by one-inch boards, or six four-inch by one-inch boards 30 inches long to the four-inch by two-inch sleepers. These sleepers should be at the ends, so that the ends of the feeder may be nailed to them, and they should project nine inches on each side. When everything is ready to be put together except the peak in the floor and the sides of the troughs, put the floor peak in. This is 30 inches long and is made by nailing together four-inch by one-inch and three-inch by one-inch boards, trimming the edges to meet the floor and nailing to the floor with each edge nine inches from the sides. This will put the peak in the middle. Then attach both ends, running the lower end an inch below the flooring, and nailing to the sleepers flooring and peak. Next nail the sides between the ends, standing them in from the upper outer edge of the ends towards the middle of the floor, thus leaving a space between the sides of the floor and floor peak for the mixture to feed through. Nail four-inch by one-inch boards 30 inches long to the floor and ends, planing the lower edges to fit the floor, for the sides of the trough. The roof, which should be covered with some waterproof material, is put on last. After the edges have been planed to fit properly at the peak, one slope is nailed down, and the other is hinged to it.

Of course, the feeder may be made longer than specified above and otherwise altered to suit circumstances.

A Barrel on A Platform With A Pyramid in the bottom To slide the Grain to openings cut in 3 or 4 sides of the Barrel

Barrel Type of Feeder

Another cheap and convenient form of automatic feeder is a barrel as shown in engraving. The illustration does not require much explanation. The outlet holes may be made on four sides, and the size varied according to requirements. The pyramid or cone causes the grain to run out more freely and completely. Three-inch by two-inch hardwood boards might be nailed to the platform a foot or so away from the barrel, so as to prevent the food spreading too much.

Produce Cleaner Milk

MANY dairymen will remember the excellent work done by Professor C. F. Hoyt of the United States department of agriculture, and regularly located at Salt Lake City, at the California state fair, and also at the Liberty Fair held in Los Angeles. Professor Hoyt has referred often to the high quality of milk produced in California dairies. Especially has he complimented dairies supplying the city of Los Angeles and the Los Angeles Health Board in its effort to secure pure milk for that city. The department of agriculture now issues statement regarding some of Professor Hoyt's work in California as follows:

Mr. Hoyt has been engaged in making a study of the milk supply of the city of Los Angeles. He found that more than two-thirds of the distributors, representing more than 90 per cent of the supply, had an average bacteria count for the four month period of December, January, February and March of less than 10,000 per c. c. There are many dairymen also who deliver to pasteurizing plants, milk with less than 10,000 bacteria per c. c. It may perhaps be better understood that these counts are very low for the milk supply of a large city if it is recalled that the medical milk commissions allow a count of 10,000 in certified milk.

These results indicate, as indeed is the case for all seasons of the year, that in this city the dairymen suffer practically no loss from souring. They appear to be due, not to elaborate and expensive equipment nor to expensive methods, but to simple cleanliness in handling and to the convenience and suitability of equipment which renders easy such cleanliness of handling.

On a large number of these dairies one notable feature is the character and location of the milk house. These milk houses are small and are located on the windward side of the barn and very close to it. There is a passage way between the barn and the milk house of perhaps six feet and the floor of the milk house is extended to the barn door. This nearness to the barn makes it easy for the milker to empty each cow's milk immediately after milking and removes the temptation to allow the milk to accumulate in the barn. Further the milker does not have to wade through mud and dirt to reach the milk house, nor does he carry such mud and dirt into the milk house on his shoes.

The floor of the milk house is of cement, so inclined as to drain properly. The inclination is such that the drainage passes directly into the gutter behind the cows and out of the barn at the far end. The interior walls, at least for the lower three or four feet, are usually of cement on metal lath and they are faced smooth with cement plaster so that they can be readily washed. Frequently the interior walls, both wood and cement, are painted. The exterior is of thin boards, there being an air space between the two walls.

The most distinctive feature of these milk houses is the system of ventilation. On the windward side near the floor there is an opening about a foot wide extending perhaps half the distance of that side. On the opposite side near the roof there is a similar opening. They are both well screened. By allowing the floor to be damp, the current of air entering at the lower opening and leaving at the upper opening causes evaporation and a notable lowering of the temperature. Cans of milk covered with wet burlap may be placed near this lower opening in the evening and by morning attain a much lower temperature than similar cans placed in a water tank.

It is believed that dairymen would do well to adopt the ideas expressed in this type of milk house.

C. F. Hoyt

C. F. Hoyt, market milk specialist of the United States department of agriculture, located at Salt Lake City, and well known to Californians because of his serving as judge at California State and Liberty fairs.

BIG TALK

Orville Wright, at a dinner in Dayton, talked of his early struggles.

"We had, my brother and I," he said, "lots of oral encouragement. People talked big, but they would put up nothing. With their mouths full of millions and their quite empty hands, they reminded me of a barber I once knew.

"This barber said one day as he shaved me:

" 'That's a fine pup of Wilberforce's. I'd give anything for it.'

" 'Well, it's for sale, isn't it ' said I.

"The barber burst into harsh, sneering laughter.

" 'Oh, yes, it's for sale,' said he, 'but Wilberforce, the scamp, wants $1.50 for it.' "

Lankershim, Los Angeles County, one of the newer dairy sections, claims over 1000 dairy cows within three miles of that center.

Here Are Two Savers

Simplex Silos

save the crop that would be wasted in the fields.

All silos are savers. Here are 4 big reasons why the Simplex ranks above all other silos as savers of feed:

1—It does not leak air nor ensilage juices.

One-piece unspliced Oregon Pine (Douglas Fir) staves keeps the ensilage juices in and the air out. The result is a perfect siloing process.

2—Its sides remain round and straight.

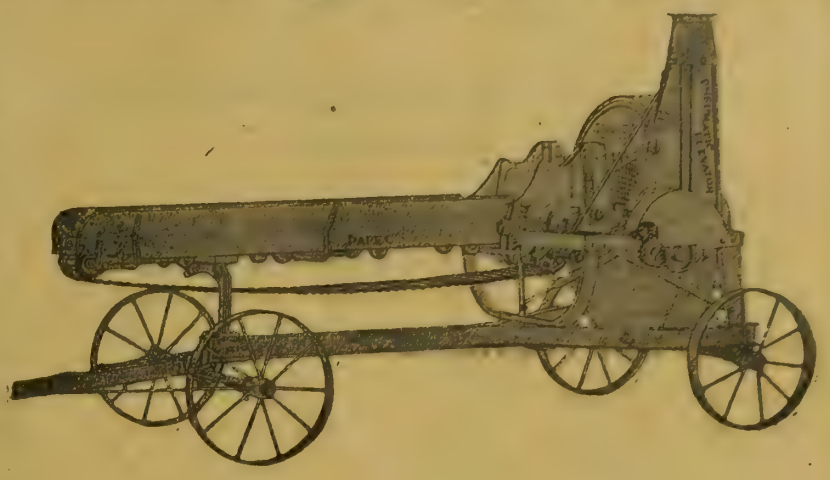
The Crissell Tangent Top Device keeps them so. It insures the strength and stability of the silo by keeping it round under all conditions.

3—It survives the strains of pressure and of weather.

The weight of many tons of ensilage demands strong construction. Wind and frost must be met. The Simplex is bound with hoops of clean new steel and anchored by a double interlocking system of heavy cables. It is built to last.

4—All parts of the Simplex are built equally well.

The steel re-enforced doors save time in handling. The roof is made to resist weather and save repair bills.



Sooner or later you will build a Silo.

Send for the folder.

Papec Ensilage Cutters

Save Power

Papec cutters throw the ensilage as it leaves the knives. Thus less power is required on the blower. Here's part of the Papec guarantee: "We guarantee that ANY Papec Cutter will cut and elevate more ensilage with the same power than any other blower cutter."

Save Repairs—

A one-piece steel frame keeps the knives in line. Papecs are built for rough treatment and all the work that you can pile into them. Our guarantee—any part that shows faulty workmanship or material replaced free.

Save Crops—

With your own cutter you can fill your silo when the crop is ready. As the silage settles you can fill it again. Only with a cutter right at hand can you make your silo do its full duty.

Save Time—

Dependability is mighty important in any farm machine. You can depend on the Papec. It will perform heavy duty without breaking down and all of its work will be well done.

Some Reputation

Oakley, Cal., Nov. 19, 1918.
Santa Fe Lumber Co.,
San Francisco, Cal.

Gentlemen: Three seasons ago I replaced an —— with an L-16 Papec Cutter from your stock at Brentwood, Cal., your distributing point, and I have had excellent success with it. In fact, the reputation of your cutter has gone all over this delta country and was the cause of a sale to one of my neighbors; also another neighbor has promised to buy a machine next year when his old machine is out of commission. At any time I shall be glad to boost for the Papec. E. H. FOX.

The "Why" of the Wheel

An ensilage cutter with four or less fans requires an elevating pipe large enough to receive at least one-fourth of the ensilage cut at each revolution of the cutting wheel.

A Papec—with its six fans—requires a pipe large enough to receive only one-sixth of the ensilage cut at each revolution of the wheel.

Thus the Papec, with its **SIX** fans and **SMALL** pipe, "throws and blows" a steady stream of ensilage with a force more concentrated and with a pressure much greater, than a cutter with four or less fans and a larger pipe.

Papec Ensilage Cutters Require Less Power and Elevate Higher.

Live Stock News Notes

Fine Ones at Tulare Sale

Allen Thompson, who for the past 15 years has been breeding Duroc-Jersey swine on his ranch near Tulare, is busy preparing 15 sows and gilts for the breeders' sale to be held in Tulare during July. They will all be bred to his two herd boars, Joe's Orion Cherry King 5th and Lord's Orion Cherry King. He also has 11 sows with litter at side from which he expects to select his futurity candidates Recent sales include two bred gilts to Robt. K. Gilbert, Bakersfield.

Big Type Polands

On Sunnyside Farm, R. F. Guerin, Visalia, is being developed a herd of big type Poland-Chinas. Mr. Guerin states he expects to maintain a larger herd in the future and place it on a par with the Holsteins he has been developing the past few years. He has selected for his herd boar Big Bone Leader of Sunnyside, a son of King's Big Bone Leader. Three of his children have entered the Tulare County pig breeding contest with Poland-Chinas of spring farrow.

Some Fine Gilts

W. J. Stewart, Visalia, one of the younger breeders of Duroc-Jerseys, states that it is not his intention to maintain a large herd but that he will confine his efforts to eight or ten high class sows. He expects to have four last spring gilts in the coming Tulare Duroc-Jersey breeders' sale.

From the East

S. A. Williamson, Duroc-Jersey breeder, Visalia, has recently received a young boar, Jumbo's Illustrator, from the herd of Cramer & Son, Monroe, Iowa. He will have in the Tulare sale four gilts bred to his present herd boar, Orion's Defender.

Fulgram's Durocs

W. J. Fulgram & Sons, Duroc-Jersey breeders of Visalia, will in the near future receive a shipment of a number of sows and gilts from the East. They will also show this fall especially in the futurites. For this show they will probably select the litter by Ideal Pathfinder out of Royal Critic 2nd, a sow purchased at the mid-winter sale of Otto Linninger for $800. The dam of this sow, Royal Critic, was grand champion at the 1917 National Swine Show and sold for $2600.

Proved by Test

Ninety head go to make up the herd of Jerseys on the ranch of A. A. Jenkins, Tulare, of which only 19 are at present in milk. Of these seven are in the R. O. M. and the remaining 12 have all qualified but have not as yet finished their yearly test. The 19 head are returning their owner a little better than $25 per head per month. Recent sales of young bulls by the herd sire, Smith's Mermaid, are: A. B. Sherwin, Tulare; E. L. Hafgraves, Tulare; Chas. F. Holverstart, Earlimart; and Mr. Nichols, Delano.

Tilly Alcartra Begins Another Year

With a total of 156,776.1 pounds milk and 6141.36 pounds butter to her credit for her first six lactation periods, Tilly Alcartra, the greatest dairy cow the world has yet known, dropped a fine heifer calf by Sir Aaggie De Kol Acme on April 8 and is just now beginning her seventh consecutive year on test. She is in as good condition as she was a year ago apparently, possibly not carrying quite so much flesh, and while she has only just started on official test she promises to hit the 100 pounds of milk per day mark within a few days and is already going around a 30 pound butter gait. However her past performance shows that she is comparatively slow to reach her high point in production and thirty days from now will give a better line on her. She will be bred to Carnation King Sylvia, the famous $106,000 bull owned by Carnation Stock Farms, Seattle, Washington.

A Wonderful Two Year Old

Miss Aaggie Acme Burke, sired by Segis Pontiac De Kol Burke and out of Aaggie Acme of Riverside 2nd, who holds the world's strictly official record for butter produced in one year, recent-

GARBAGE

Calf Scours

Save every Calf. High meat and milk prices make control of Calf Scours more necessary than ever before.

Scouring calves indicate a germ infection that is likely to run through your entire herd with serious losses. The loss of one calf is bad enough, but nothing compared to your loss when the infection spreads, as it will unless checked. Then your year's work in building up your herd is wasted and your profits lost.

B-K, the powerful germicide and disinfectant will promptly stop scours and finally banish it from the premises. B-K contains no poison, acid nor oil. When used internally it destroys germs, heals inflamed membranes, relieves irritation, restores healthy action. B-K may be given freely in milk and drinking water.

The B-K plan is simple and practical. It is giving wonderful results. Send for "evidence."

FREE BULLETINS: Send for our valuable bulletin No. 136, "Calf Scours," also information on other farm uses and our "Trial Offer." If your dealer does not have B-K, send us his name.

The Cutter Laboratory
Berkeley, Cal., or Chicago, Ill.
"The Laboratory That Knows How"

Imperial Valley cattlemen are now shipping to Kansas City.

ly freshened at the age of 27 months in the A. W. Morris & Sons herd of registered Holsteins, Woodland, and made 26.18 pounds butter from 488 pounds milk in seven days, and in 30 days made the splendid record of 2322.4 pounds milk and 106.53 pounds butter, the latter a California record in class. This wonderful two year old has milked as high as 89.5 pounds in one day and bids fair to make a great yearly record.

More Yearly Records in Morris Herd

De Kol of Valley Mead 3d recently completed a yearly record of 19,090.4 pounds milk and 845.11 pounds butter in the A. W. Morris & Sons herd at Woodland, while her herd mate Zaza Tuebie Prophetess made 21,582 pounds milk and 885.22 pounds butter in one year as a junior four year old. The grand old cow Aaggie Acme of Riverside is making around 70 pounds butterfat in her eighth month and in 254 days has to her credit 756 pounds butter with every indication of crossing the 1000 pound mark for the year.

Will Handle Herefords at Dixon

W. D. Duke of Likely, proprietor of the Alamo herd of Herefords, is making his plans to transfer his pure bred operations to a ranch he is developing near Dixon. Duke will probably hold a sale of Herefords some time this fall.

Famous Shorthorn Herd Moved to Sacramento

Edward Cebrian of San Francisco, who recently purchased the famous Paicines herd of Shorthorns, has bought a large ranch near Washington Lake just west of Sacramento and expects to move his Shorthorns to the new location as soon as suitable buildings can be erected.

This herd of Shorthorns is one of the best bred collections in the West. It was founded a number of years ago by J. King Macomber and a few years ago was greatly augmented when nearly all the famous Elmdorf herd from Kentucky was added to it.

Tulare Durocs Sell July 16

R. C. Sturgeon of Tulare states that the Duroc breeders of that section will hold a combination sale at Tulare, July 16. Sturgeon expects to consign 12 bred gilts sired by or bred to Golden Col. and California Cherry Chief.

The sale held at Tulare last January was highly successful and in view of the character of the offering now being prepared it is expected that the forthcoming sale will surpass the January event.

Brighton Shorthorns to Harrison

H. L. Murphy of Perkins has recently sold to Thomas Harrison of Santa Rosa two Shorthorn cows and calves. One of the cows was a Duchess of Gloster and the other was Miss Utility, a Frantic cow, descending from the old time Ashburner herd. Murphy says that both the Harrison purchases are extremely strong milkers and that he considers the Frantic cow to be one of the best milking Shorthorn cows in California. The Murphys, Harvey, George and Elmer, belong to a family that has been identified with pure bred live stock about as long as any California family.

Carruthers Visiting Eastern Herds

W. M. Carruthers, Live Oak, is now in the Middle West visiting the leading Shorthorn breeding establishments. While east he expects to select a herd bull prospect and perhaps a few high class females.

Carruthers will be away about a month, returning in time to prepare the offering he will sell at public auction July 10. The place of sale has not been definitely decided, but will probably be at the State Fair grounds, Sacramento.

Carruthers declares that it is his intention to assemble an offering that will be the sensation of the year in Western Shorthorn circles. The sale will consist of between 50 and 60 head, most of which will represent the get of Count Glory, the grandson of Avondale, that was champion at the State Fair of 1916, 1917 and 1918, and Hallwood Villager, now senior sire in the Carruthers herd.

Head of Jersey Herd

F. W. Elleby of Modesto has recently received from C. I. Hunt & Son of Nunda, New York, a young bull that he has selected as a future herd sire for use in his herd of registered Jerseys. This richly bred calf is sired by Oakland of Nunda, a grandson of Noble of Oaklands and Royal Majesty. The calf's dam is a daughter of Pedro of Bleakhouse 2nd. She is now on a yearly Register of Merit test and promises to make a highly creditable record.

The Economical Way Of Handling Grain Adopted By Thousands Of Western Farmers

Bulk handling of grain, elevating it into bins, granaries or cars with John Deere Elevators, is saving Western grain-growers thousands of dollars. Sack expense and cost of sacking are entirely eliminated. The crop is handled in less time, with less waste and with less help.

John Deere Elevators are used to empty grain bins also, when the grain is marketed

JOHN DEERE TUBULAR STEEL ELEVATOR

Fifteen to twenty bushels of grain per minute—that is the capacity of the John Deere Elevator with a three to six-horse-power farm engine. You can control the capacity, by means of an adjustable gate in the hopper, to adapt the elevator to the power applied—a big advantage.

The hopper folds up out of the way—you drive up the load and lower the hopper—no backing of the load.

Built of steel almost entirely, there is no warping or decaying—the John Deere will last almost a lifetime. The elevator, built of 3/16-inch steel well casing into which fit round flights, handles without wasting or cracking, all kinds of small grains.

John Deere Tubular Steel Elevators are furnished in two types—the John Deere Portable—a 23-foot mounted outfit—and the John Deere Pony—a 17-foot unmounted outfit. Your selection depends upon individual needs.

Get Your Share of This Big Saving

Adopt the bulk method of grain handling. Get a John Deere Elevator and let it continue to save you money for years to come. We have a booklet that tells all about John Deere Elevators. Write for it today. Ask for Package T-2 4

Cattlemen Propose to Make Cooperative Shipment East

About a year ago representative cattlemen met at the University Farm, Davis, at the suggestion of L. A. Nares, president of the California Cattlemen's Association, and at the time a member of the live stock commission of the food administration for California, for the purpose of determining upon a satisfactory and workable plan of organization. Nares outlined the plan he had in mind, which was based on a zone plan embracing county, zone and state organizations. The plan was adopted and a permanent organization effected last winter. The first convention of the new organization was held at the University Farm April 8 and 9.

The main purpose of the meeting was to discuss the marketing problems affecting live stock producers of this state with the hope that some definite constructive improvements could be introduced.

In opening the meeting President Nares stated that a fair degree of progress had been registered, but frankly told the delegates that the association could in no way expect to make the most of its opportunity or to function as intended until the membership included at least 51 per cent of the cattle of California and that as an association they should represent no less than 75 per cent of the industry before they could really act as a stabilizing force. Nares pointed out that one of the most disastrous periods of the year, from the marketing standpoint, occurred in May and June when Coast markets experienced a heavy run, amounting to a glut, occasioned by the flood of grass fat stuff. As a result of the peak movement prices usually broke and the producers caught in the jam were forced to take bargain counter prices. Nares felt that if this annual feature of the market could be avoided that the entire industry would benefit. From this suggestion the market committee offered a plan under which several train loads of grass stuff would be sent to Missouri River and Eastern markets during the May and June run. The committee stated that they had perfected arrangements with Eastern commission firms to handle California cattle and that an advance of 11 cents per pound would be made the shippers and the final sales adjusted by either adding to or reducing the price accordingly as the cattle sold. The committee announced that they had already received notice that many outfits would take advantage of the plan suggested.

Gilbert J. Waller, who founded the successful cooperative Hawaiian Meat Company, told of the conditions that led up to the establishment of that concern, the plan of operation and the results obtained by the Island producers. Waller pointed out that the isolated location and other unusual conditions made such a plan practical in the Islands and that such a plan would perhaps be more difficult to operate on the mainland.

The delegates looked with favor on the plan recently announced whereby representative Eastern producers, packers and government experts proposed to form a Conference Committee on the Live Stock Industry, for the purpose of bringing about a better understanding between the various interests, and steps were taken to establish such a conference in the Coast industry. The following men were appointed to represent the association in the event such a plan is inaugurated: N. D. Lack, Redding; O. B. Fuller, Los Angeles; Howard Jack, Chalome; J. W. Guiberson, Corcoran; O. G. Meyers, San Francisco, and Owen Duffy, Napa.

O. M. Plummer, general manager of the Pacific International Live Stock Show, Portland, told of the organization of that show, how it was financed and what it hoped to accomplish for the Northwest.

Plummer stated that the Northwest had raised a quarter million dollars for a permanent building and that the show classification would distribute $65.000 in prize money.

The show was financed by raising 50 per cent in the 35 counties of Oregon and 50 per cent in the city of Portland. Each county raised a fixed sum based on the live stock population. Plummer declared that city organizations should not regard live stock shows as means of bringing outside money to the city housing the show, but that they should regard such shows as powerful aids in developing the resources of the state and thus the city would profit through the increased prosperity of the state as a whole. He said he hoped that Los Angelees and San Francisco would establish shows this fall and each become a part of a Western circuit.

W. T. Sesnon, president of the California International Live Stock Show, stated that he felt he could assure the live stock interests of the West that San Francisco would establish a permanent show.

Judge Peter J. Shields of Sacramento, who has long been identified with live stock development in this state, told of the pioneer organizations and the men who blazed the trail for better live stock in California.

The more important resolutions adopted by the convention follow:

Indorsing the establishment of a live stock show at San Francisco.

Favoring the return of the railroads to private ownership and protesting government service.

Favoring the taxing of non-resident owned sheep and cattle.

Favoring increased appropriations for the college of agriculture.

Endorsing all resolutions adopted by the National Live Stock Association, especially memorializing congress in regard to proposed packer legislation, favoring the Kendrick bill and opposing the Sims bill.

Endorsing Dr. A. L. O'Banion for the office of assistant state veterinarian.

Protesting the shipment into California of government owned horses for disposition by public auction.

Notes on the Shorthorn Sale

(Notes of the Shorthorn sale held at Davis April 8 and which we were unable to include with account and list of sales given in last week's Cultivator.)

Frank W. Harding, secretary of the American Shorthorn Breeders' Association, attended the sale and in a short talk delivered at the opening of the sale declared that there was never a more opportune time to enter the business of producing Shorthorns than exists at the present time. Harding stated that the big force back of the active demand for Shorthorns throughout the corn belt section was furnished by new men who were entering the business in a small way, but who had become convinced that the better the foundation the more certain the profits.

He predicted a rapid expansion of Shorthorn breeding operations in California, and pointed out that there was an immense territory tributary to this state that would always furnish a market for surplus bulls.

Harding also stated that an extensive shipment of Shorthorns bound for the Argentine and Uruguay had been assembled and was waiting on transportation. He was also of the opinion that the establishment of union stockyards and live stock shows would prove powerful factors in the live stock advancement of this state.

C. G. Hopkins, manager of the Conway Ranch, Woodland, who purchased the top bull of the Pacific Coast, announced that it was the intention of the Conway people to establish one of the first herds of the West and that they proposed to select a herd of females of sufficiently high character to mate with the $5500 bull. The Conway Company is developing a tract of over 20,000 acres and in their plan of development live stock will be given a large place.

It looked like old times to see Senator Benj. F. Rush of Suisun bidding

on the good females of the offering. Senator Rush is one of the veteran Shorthorn breeders of California and a few years ago cattle from his herd were prominent in Western show rings. Senator Rush bought his first Shorthorn cow in 1868 and he says that he cannot get away from his first love. His purchases were made with rare discrimination.

The London Estate, Glen Ellen, furnished the top consignment to the sale, aside from the University lots. Five females of attractive Scotch breeding averaged $1090. Almost from its inception the herd has been under the direct management of Mrs. Eliza Sheppard, sister of the famous author.

California women are becoming actively interested in the live stock game. Among the good buyers at the sale were Dr. T. T. Purkett of Willows, who secured three head; Mrs. J. C. Todd, Monterey, two head, and Miss Lillian Julian, Montague, one head.

J. W. Salz, Bloomfield, was one of the heaviest buyers. Salz selected three females and the good young bull, September Knight, consigned by T. S. Glide, Davis. For the latter he paid $850—the second highest price paid for a bull. Salz is laying the foundation for a pure bred herd that he expects to make a factor in the breed's advancement in this state.

R. Parson of Hilt made a nice buy in the roan two year old heifer, London's Lavender, for which he paid $1025. She is by Roselawn Choice and out of a Lavender dam.

If an early start presages success Master John Elmo Montgomery of Davis will be about as famous in the Shorthorn business as his father, Elmo Montgomery, is in the light horse world. Master John bought the first heifer offered, Roan Butterfly, a daughter of Gibson's Goods consigned by Dr. Elberg, for $375, and so determined was he to own her that Col. Reppert had to watch that he did not raise his own bid.

Frank Brown of Carleton, Oregon, a Shorthorn breeder of note, judge at the 1918 International and Western representative of the American Shorthorn Breeders' Association, attended the sale and always bid on the top lots. Brown is regarded as one of the leading Shorthorn experts of the United States.

This year the University authorities anticipated an increased crowd of buyers, and although nearly twice the seating capacity of last year was provided, the acommodations proved entirely inadequate and many buyers and spectators were forced to stand. It is to be hoped that by next year the University will mature plans that will satisfactorily take care of the increasing crowds. One doesn't feel in the mood to buy after standing all day.

$100,000 Shorthorn Appropriation for This Year

At the January meeting of the board of directors of the American Shorthorn Breeders' Association it was voted to appropriate $100,000 for Shorthorn prizes at the fairs and shows throughout the country for the current year.

This generous attitude on the part of the directors embraces also county fairs, a special championship bull award being offered at 400 of these, the prize being $25, the entry being owned within the county in which he competes for the prize. The purpose also is to recognize state and district association sales where a show is combined with the sale and all animals entered in the show sold in the sale. A graduated amount is set apart for these combined shows and sales, depending on the number of animals entered.

A departure in the way of a herdsman's prize is offered at a number of the leading fairs and shows for neatness and general appearance of their exhibits. The details of this contest, which is a most useful one, will be announced in due time.

The usual appropriations for the established fairs and shows were made with a number of important additions. As these are based on the plan of one dollar from the Shorthorn Association for two dollars from the fair or show association, it becomes apparent that there will be available as a prize fund for the Shorthorn exhibitors of the country an amount reaching well up toward the $300,000 mark.

Never before has such a gigantic sum been set apart for distribution among the patrons of any breed of live stock, nor was there ever a more general or more equitable distribution of a prize fund. The beginner and the small breeder are considered in these appropriations. The boy and girl in the calf club have their opportunity to win a share in the prize money. It is an open contest with the best interests of the largest possible number considered.

This action on the part of the Shorthorn directors is in line with the adopted policy of progressive service to the Shorthorn fraternity as a whole. It is a long stride forward in the direction of the improvement of Shorthorn standards and encouragement of Shorthorn trade. It is evident that those who cast their lot with the Shorthorn will not lack for organized support of a most substantial nature.

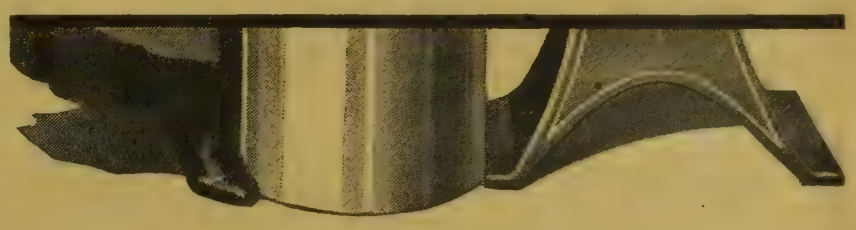
$5000 BULL SOLD FOR $50

When a certain farmer a few years ago sold his registered Holstein bull to his local butcher no records had been made by any of the bull's daughters. Within a year 11 of the daughters freshened at the ages of two and three. Records were made of milk and butterfat production, and to the astonishment of everybody the average milk production was 14,502 pounds and the average butterfat production was 573 pounds.

But before these records were available the bull was dead and his hide had become leather. Because there were no records, a $5000 bull had been sold for $50. The cow testing association tests the dams and daughters, and the bull association makes it practicable to keep a bull until his daughters have been tested. These two associations would have saved that bull.

Registration alone can not guarantee production. Registered dairy bulls should be backed by good production records. Without record backing they may be very well bred, but there is nothing to prove it.

GLENN COUNTY POLAND BREEDERS ORGANIZE



Twenty-five Poland-China breeders of Glenn County have formed the Glenn County Poland-China Breeders' Association and elected the following officers: President, R. J. Yates, Orland; vice president, J. M. Leonard; secretary, Leonard McKaig; treasurer, Charles Temple. The directors are: S. F. Williams, D. H. Ward, Alec Lake, M. Penfield and W. S. Gurnett.

The purpose of the organization is to further the cause of the breed in Glenn and neighboring counties. Glenn County boasts of having more Berkshires and Durocs than any county in the state and the new organization proposes to make the statement include Poland-Chinas.

An organization of farmers producing hay has followed closely the Hay Congress held recently in Phoeniix, Arizona. This will be known as the Salt River Valley Ranchers' Association and has been incorporated under the state laws. The activities of this association will be confined at the present to hay, but later may extend to take in other products.

The Man Who Buys a
DE LAVAL
Is Taking No Chances

MOST any kind of cream separator will do fairly good work the first few months, when it is new.

But if it is a cheaply made or inferior machine, after the first few months your trouble will begin.

And the worst of your experience with such a machine will not be the fact that it wears out quickly or that it runs hard, or that you are piling up repair expense, but that you are losing a lot of butter-fat that is worth 50 to 60 cents a pound.

And that is what you really buy a separator for—to save this valuable butter-fat.

Any time you buy a cream separator — no matter who makes it or what claims are made for it—that has not behind it a long record of satisfactory service, a record known to all, a record that is in itself a guarantee of satisfactory service, you are taking a gamble with all the odds against you.

Why take chances at all when you come to select a machine that may mean so much in increasing the profit from your cows?

There is one cream separator that has been the acknowledged world's standard for over 40 years. It's the one cream separator that is used by the creamerymen almost exclusively. Dairy farmers the country over know the De Laval and its sterling quality. Experience has shown them that

It is the best cream separator that money can buy

Order your De Laval now and let it begin saving cream for you right away. Remember that a De Laval may be bought for cash or on such liberal terms as to save its own cost. See the local De Laval agent, or, if you don't know him, write to the nearest De Laval office as below.

VICTORY LIBERTY LOAN

LIVE STOCK INTERESTS START CONSTRUCTIVE PLAN

By Frank B. Anderson, Director, California Swine Breeders' Association

A CLEARING house of live stock, packing, retail, transportation and consumers' interests was launched at a meeting of live stock representatives and packers held in San Francisco last week, the purpose of which will be to attempt to solve some of the problems of the meat industry affecting all concerned from the producer to the consumer. Ralph P. Merritt has been invited to head the new organization.

The plan was launched as the inspiration of a meeting called to confer with Louis D. Hall, head of the bureau of markets of the United States department of agriculture and in charge of the supervision of stock yards control for the government. Hall outlined the work his bureau is doing throughout the country and how it is endeavoring to better handle the problems of the stock growers and those handling meats. Many marked improvements in marketing conditions have been brought about under his supervision and a better understanding secured between producers, packers, retailers and consumers.

After hearing Hall, as well as remarks from various cattle, sheep and hog men, and packers, the sense of the meeting, which was presided over by Prof. Gordon H. True of the University of California, was that steps should be taken to form a permanent organization whereby the various interests could be represented. Many grievances, real and imaginary, occur from time to time, but nobody seems to be in a position to handle them. This new organization can hear the complaints of the different interests, weigh the evidence and if any condition needs correction, be in position to recommend the remedy.

The meeting voted to have the new organization made up of five representatives each from the California Cattlemen's Association, the California Swine Breeders' Association, the California Sheep and Wool Growers' Association, the packers, the retail butchers, five representative consumers, one from the animal husbandry department of the University of California, one from the division of rural institutions of the university and one from the transportation companies.

As soon as the various live stock organizations name their representatives and the packers, retailers, transportation interests and consumers are heard from, a meeting will be called for San Francisco early in May and steps taken to perfect the association.

Hall commended the California interests for taking this step and assured them that the bureau of markets would be glad to cooperate with them in every undertaking, and would put at the disposal of the new organization any data or service required.

During remarks by a number of stockmen, the proposition of a union stockyards was advocated, many explaining that for years they have consistently opposed a stock yards, but believe that the time is not far off when such a method of disposing of live stock will be necessary. Los Angeles and San Francisco were the points mentioned as logical stock yard locations. It is likely that the outgrowth of the new organization will be to seriously consider the question of securing stock yards at either or both of these points.

Many veteran stockmen stated that they have been attending meeting after meeting for years, but were of the opinion that the plan launched at this joint session would be more fruitful of good results than anything of the kind attempted in the past. Each different branch of the live stock industry will remain intact and not have any of its functions absorbed by the new organization, but the problems which cannot or are not handled by any one branch of the industry can better be disposed of by the organization. It will be furthermore unique in that it will have representatives of consumers, which has not been attempted before.

Santa Barbara will hold a horse show May 2 and 3. There was no exhibition of this sort in the United States during the war. Many thoroughbred horses are owned in Santa Barbara and Montecito. C. K. G. Billings, who lives there, has agreed to show Uhlan, the world's unbeaten trotting champion. Other notable entries are coming from all up and down the Pacific Coast. As it will be an equestrian show, polo ponies will be featured. Various well known strings, such as the Hecksher, Fleishman, Hammond, etc., are owned here.

BRINGS CHOICE BULLS FROM THE EAST

R. M. Dunlap of Sacramento, who has long been identified with the beef cattle industry of this state, has but recently returned from an extended trip through the Middle West, where he selected a shipment of Shorthorn and Hereford bulls for California breeders.

Three Hereford bulls were purchased for H. H. Gable of Esparto, and among them was the good bull Don Perfect. This bull is a son of the International champion, Point Comfort 14th, and was secured from C. C. Griffith of Iowa, in whose herd he made a splendid record as a sire. He was bred by the late J. M. Curtice of Independence, Missouri, and according to Fred Reppert, the noted Hereford auctioneer, he was counted one of the best bulls in Iowa. He is fronted with a well nigh perfect head and horn, in no wise coarse, but full of character. He is exceptionally thick and well balanced from front to rear; wears an excellent coat of hair, and stands on plenty bone. The other Gable bulls are strong, thick fleshed, heavy boned fellows that will be used in the range herd.

Dunlap also brought out a Hereford bull for S. R. Crowe of Haywards. This bull, a short aged two year old, was bred by Irvin Spooner of Mondamon, Iowa, and was shown by him quite successfully as a junior yearling. He went through the Spooner sale as a yearling but was later repurchased and used extensively in the Spooner herd. He is strongly bred Beau Donald on his sire's side and is rich in the blood of Corrector on his maternal side. The Spooners recently refused an extremely long price for his sire. He is described as being hard to fault in any particular and is particularly well headed and of extreme quality combined with plenty of bone.

Ten head of Scotch Shorthorn yearlings went to Creps Bros. of Wheatland and will be held over for 1920. These youngsters are good, thick reds and roans. The same firm also secured a choi e roan junior yearling by King Avondale, and out of Hampton's Myrtle, and a Cruickshank Lavender, a grandson of White Goods, calved June, 1916.

Dunlap also delivered five roan and red yearlings, principally Scotch breeding, to William Foster of Redding. Most of the Shorthorns in the shipment were selected from the Hopley Stock Farm at Atlantic, Iowa, and a number of them are sons of the famous Village Beau.

James L. Hamilton, Exeter, received three Polled Durhams, two reds and a roan. The latter is an exceptionally high class bull. He has a double cross of Whitehall Sultan back of him, as well as some Choice Goods bloods. Hamilton has been using polled bulls on high grade Shorthorn cows and has succeeded in having most of his calves come without horns.

In speaking of his recent trip Dunlap said: "After being away from California since February 3, I am more impressed than ever with the future of the state as a cattle producing center. After coming from the snow and cold of the Middle West and Mountain states and suddenly dropping down into the Sacramento Valley, with the orchards in bloom and cattle knee deep in grass, one can reach just one conclusion, and that is that here is a cattle paradise. If one really wants to appreciate California let him spend March most anywhere else. It is interesting to watch the actions of the cattle when the train leaves the snow sheds and they get their first whiff of green grass—they at once take on a new look and apparently lose any homesickness they might have."

Dunlap says that he has never known a more active interest in better cattle than exists in this state at the present time.

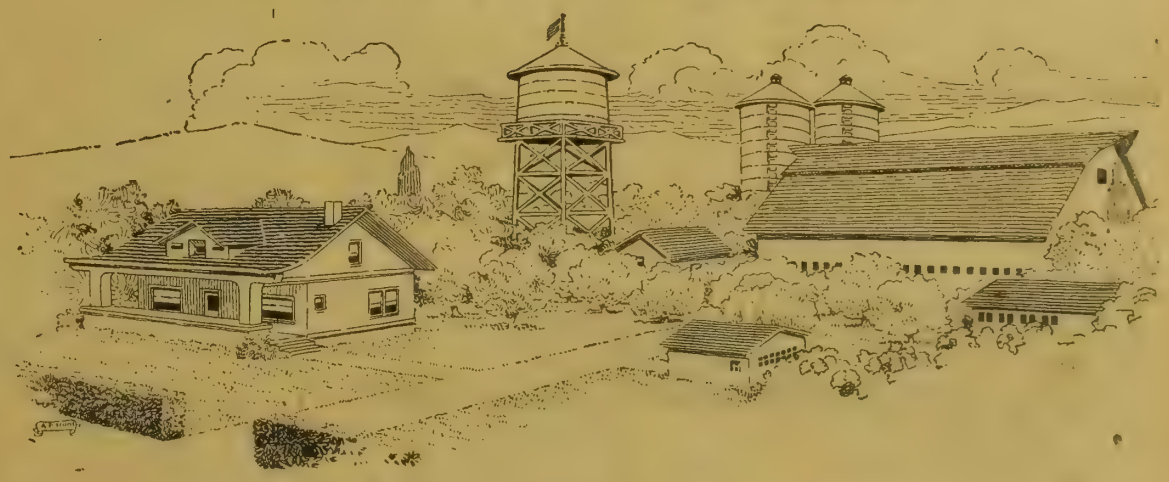
Dispersal of McAlister Herd

May 21 and 22 will be the big red letter days in the history of Holstein cattle in California, for they will mark the days of the McAlister & Son's herd dispersal. This herd has been one of the oldest and most prominent in the entire West during its exstence for the last ten years and in 1917 achieved the distinction of having broken more state butter records than any other two herds in California, yet in 1918 even larger records were made. The main idea has always been kept in mind to build a herd composed solely of large milk and butter producing Holsteins which would be profitable throughout the year. In the three time string the average production per cow has been over nine gallons per day while the two times have done proportionately as well.

There will be sold without reserve 27 cows that have given over 25 pounds of butter in a week and a large number of their daughters by the great sire "It", the only bull in the world to contain 100 per cent the same blood as two cows that have given over 1000 pounds fat in a year. Never before in the West has a herd of 200 head been dispersed where there has been given the opportunity to every dairyman to buy such uniformly great producing cows at his own price.

Buena Alta Aaggie Ormsby

Freshening at two years six days, without a pound of grain before freshening, she made an official record of 19.13 pounds butter in seven days. Owned by R. C. Sturgeon, Tulare.



Edinburgh Scotsman: The professor of a certain medical college asked a student how much of a certain medicine should be administered to the sufferer.

"A tablespoonful" promptly answered the young man. In about a minute, however, he raised his head and said:

"Professor, I would like to change my answer to that question." The doctor took out his watch.

"My young friend," he observed gravely, "too late! Your patient has been dead forty seconds!"

Ask the Man Who Owns a Pacific

The best proof of the worth of a silo is the opinion of the farmer who owns one. Ask any Pacific owner about his silo. See what he tells you about silos in general and Pacific in particular.

Our thousands of satisfied customers are the best proof and recommendation you can ask us to offer.

We built the Pacific for the farmer's use. Years of valuable experience gave us a clear insight into his requirements. As a result we have a silo that will stand every test you may put it to.

Heat, cold, wind or rain can't hurt a Pacific. Once erected you need not worry. No tightening or loosening of hoops every time the weather changes. The Pacific takes care of itself.

Pacific Redwood Silo A Profitable Investment

Straight-edged, two-inch Redwood staves; soft steel hoops with malleable iron lugs; patent hingeless doors; improved cover and anchor system and other features make the Pacific a safe and substantial investment.

Pacific patent cover is self-supporting, is watertight and fitted with ventilator and manhole.

With each Pacific is furnished complete details for the building of a foundation providing a brace for staves.

Buy a Pacific. You won't be satisfied until you get one, so why wait. The longer you put it off the more money you lose.

Pacific Silos are giving satisfaction to thousands of farmers and dairymen throughout the Pacific States. Invest in the best. One that needs no attention and will last a lifetime.

Install a Pacific Water System

Buy a Pacific Tank. Have water for all your needs all the time. Water for your stock; water for your home; water for your garden.

In case of fire you will need the Pacific Tank. It's for home protection.

Pacific Tanks are built of Redwood, strong and well seasoned. This lumber makes the most durable and serviceable tank material. Bound with highest grade, soft-steel hoops.

Pacific Tanks will not leak, shrink or burst.

Pacific Patent Non-shrinking Tanks are fitted with small grooves or channels which permit the water to flow through and around the joints. This keeps the staves tight at all times. No matter how low the water gets, the staves will not shrink.

Pacific Tanks are built in all shapes and sizes. No matter what your needs are we have a tank that will meet your requirements.

All Pacific Tanks, large or small, have the same Pacific features.

The Farm Flock of 100 Hens

By Jean A. Koethen

HENS on the farm are a side-line. Whatever the main line may be, fruit, grain, stock, or a diversity of crops, the hen belongs. She lives on the waste fruit and vegetables, the scattered grain of the stubblefield, the grass and weeds along the roadside. Not only does she live; she turns these waste materials into a most perfect finished product, for which there is unlimited demand and for the farmer always a fair price. And when her usefulness as an egg machine is at an end she provides the best of Sunday dinners. What other crop will do as much? Heat, cold, drouth, insect pests, any one of these may spoil the fruit crop, and still the tree must be watered and pruned and fertilized. The grain crop is always uncertain in California because of uncertain moisture conditions, and when it fails the time and money spent in preparing and planting the land are a total loss. There is no total loss with a hen. Summer and winter, in drouth and frost and rain, she lays right on, and if she does happen to be a slacker, which she never need be, she can still hatch layers and fryers and fill the pot herself.

But the little farm hen is not always a side line. Many a farmer has been surprised to find, when frost took the oranges and drouth the barley and cholera the pigs, that his hens had suddenly become the main line, the one crop that could be absolutely depended on. Many another has found, when he balanced his accounts at the end of the year, that his hens, kept under farm conditions, were his best paying crop.

Two years ago when we suddenly found ourselves at war, the government turned to the farmer not only for wheat and corn and pork and beef, but it also politely requested him to increase his flock of hens to 100 and to try to persuade them to lay more eggs, a reasonable request, surely, and one entirely justified by farm conditions of production. Especially is such a request reasonable in California, where, according to Edward Brown, the whole state keeps only one-tenth of a chicken to every acre.

In spite of the fact that California is not a grain state, like the states of the Middle West, California has built up a poultry industry second to none in the United States. Specialty poultrymen have always labored under great disadvantages, yet they have won out by sheer force of grit and will power. It remains to be seen whether farmers the state over will as thoroughly live up to their advantages.

The farmer has his tools and implements; he has his land, and all the rain there is, and he can always raise something "on the side" for his fowls. Incidentally, the feed needed for chickens and turkeys does not differ materially from that required for hogs, and a good many farmers have found it more profitable to turn the grain into meat on the place than to sell it to some one else to turn into meat.

A great deal can be done with poultry on the desert homesteads that dot the eastern portion of the state if only prospective settlers will remember that before they can raise either chickens or turkeys they must have something to feed them. "It used to make me sick", said a woman who had spent several years on a desert homestead, "to see new families come in bringing their chickens, before there was a green thing on their land. They soon got tired of buying feed, and many gave up and went back to town, declaring there was nothing in it. If they had gotten their alfalfa up first, and a few acres of milo or kafir, they could have made a beginning with a few chickens and increased the flock as they grew more feed. As it was, the entire venture was a failure." The desert is a fine place for turkeys, as not a few energetic women have proved, but turkeys cannot live on sage and yucca. They must have real grain and alfalfa.

Housing the Flock

Probably the chief reason for setting 100 as the size limit for the farm flock is that this is as large a number as it is usually best to keep in one house. A house for 100 hens should be about 16x20 on the ground, with either shed or gable roof, seven feet high at its highest point and about five feet at its lowest. The front should be open, with feeding trough about a foot from the ground and nests above. The rear half of the house is devoted to roosts with droppings-board beneath, and the front half is covered with straw for scratching. The simplest form of house has a dirt floor, but either wood or cement may be used, if preferred. The yard used with this house may be of any size. If I were planning for such a flock, I would try to place my house at the intersection of four fields, with a gate into each. In this way the hens could be run in the orchard, the alfalfa field, the garden or the grain at will. A flock that has some range can pick up a good deal of its living. It is not customary, I know, to cross-fence farms in this way, but the keeping of poultry would be simplified greatly if it were done. One lot could thus be given over to coops for the young chicks, another to turkeys, and the hens could range wherever it suited. It is absolutely necessary to have small yards so that all poultry can be confined when necessary, but there is much to be said in favor of letting them range as much as possible. Whatever plan is followed, it is absolutely essential that they be kept out of the garden and the front and back yard of the house. Chickens that go where they please invariably become an insufferable nuisance. It might be more convenient on some farms to fence in the yard and give the poultry the run of the rest of the farm, but there are always times when they must be kept away from the grain or the alfalfa, and these are the times when their presence in the orchard or vineyard would be desirable. In their war on insects, their scratching out of weeds and their scattering of manure hens play a useful part on every farm, aside from their value as producers.

Another reason for making the farm flock number 100, and not many over or under, is that this number can be easily handled by the women and children of the family.

Sensible Business View of the Poultry Industry

ANSWERING some of the attacks which have been made upon the poultrymen as profiteers, T. D. Cornell of Los Angeles makes a most business-like and sensible statement of conditions as they actually confront egg producers, in a recent number of the San Francisco Bulletin. We give the communication entire:

"The Bulletin has printed letters and statements concerning the cost of egg production in this state in which it has been made to appear that the compilations and charts made for the Producers' Association of Southern California by me are based on inaccuracies and false assumptions and designed to prove a position rather than to reflect facts.

"It appears to me as fair that, as I am the author of these compilations, equal publicity be given an explanation of the theory and purpose of these charts as follows:

"California is an exporter of eggs and should and will be a great factor in the egg market of the nation because of peculiar advantages. Being an exporter the usual conditions are reversed here. In California in excess of fifty per cent of the whole egg crop is produced by commercial plants, in the East 90 per cent of the total eggs are produced by the farm and back-lotters, more or less as a

by-product. Here egg production is an industry, there it is an incident. If and when egg production becomes an industry then it should be reduced to a purely business basis to which strict accounting methods must be applied.

Averages Cited

"It has been long apparent that no agreement existed in minds of the producers as to the costs of production, and because of this lack of dependable grand average data it became necessary that an analysis be made which would be a yardstick by which the efforts of the producer could be measured and the error in using the individual experience, good or bad, to measure the industry be avoided. The individual experience is valueless for statistical purposes but the grand average of individual experience is invaluable. Therefore, the assumptions made upon which to base the charts were grand average and taken from the actual experience of individuals over a period of time, involving more than four hundred thousand hens. These assumptions, being grand averages, do not coincide exactly with individual experience, but do reflect the industry.

"These assumptions are: Average annual lay, 120 eggs. The distribution of this lay by months. The annual feed consumption of a laying hen, 75 pounds. Overhead costs, inclusive of interest, taxes, death loss, replacement, labor, etc. If there be any error in conclusions the error is in these assumptions because all else is purely mathematical, and when studiously considered there has been no successful criticism of the fairness of these assumptions.

Money Loss Claimed

"Briefly, the study proves that the average poultryman, measured by business standards, has lost money every year excepting 1918, and in that year the average poultryman made a profit which shows a return for 365 ten-hour days of $786. He received in 1918 $4.60 for the product of each hen or 46 cents per dozen, and paid out $3.81 for the maintenance of that hen. In relation to food value and desirability the producer received less for eggs than the producer of any other food staple.

"In the spring and summer months 70 per cent, and in the fall and winter months 30 per cent of the annual egg crop is produced. Consumption should be constant. Therefore to avoid a glut in the spring and a famine in the winter storage must be resorted to. Extremes in the market, low or high, are disastrous to the producer and the consumer because extremes permit of manipulation and speculation. The market price of eggs should move in sympathy with and no more radically than general commodity prices. No private agency is interested in so stabilizing the market and this function is necessarily a cooperative one on the part of the producers, or a governmental one."

RICE FOR POULTRY

Answering request to the Cultivator for information as to feeding value of broken rice Prof. J. E. Dougherty of the University of California sends a ration sheet which is used in the educational work of the college at Davis. We give nearly the entire sheet which has a fund of information besides that concerning rice.

Formula 3—One pound barley, one pound oats, one pound milo.

Formula 4—One pound cracked Indian corn, one pound whole milo, one pound whole barley.

Formula 5—One pound cracked Indian corn or whole milo, one pound whole barley.

Formula 6—One pound cracked Indian corn, one pound whole milo for morning feed; sprouted barley, night feed.

Feterita or Egyptian corn may be used as a substitute for milo in the above formulas; milo, feterita or Egyptian corn may be used as substitutes for all or a part of the Indian corn and plump oats may be used as a substitute for all or a part of the barley.

Paddy or brown rice, with hulls removed, hulled rice screenings and white unpolished rice may be advantageously used in a laying ration, to the extent of not more than one-third by weight of the grain mixture, if such rice can be bought at a low enough price to more than compete with common poultry grains.

Rice bran containing no hulls and not less than 10 per cent crude protein, 6 per cent fat and not more than 15 fiber (guaranteed analysis) as well as rice polish and ground rough rice may also be economically added to the mash mixture, if it can be purchased at less cost than similar and more common feeds during periods of high feed prices. Such rice feeds should not be used to a greater amount than 20 per cent (25 per cent maximum) of the total grain and mash ration, or 20 per cent of the mash alone.

Rice feeds are very starchy and quite fattening in character. They have a high oil content and ground rice feeds are apt to turn rancid in a short time. They must, therefore, be handled and fed with care.

Pure rice bran and rice meal do not moisten readily when spread on the surface of water. If, however, they are adulterated with hulls, the hulls will soon sink to the bottom. Such hulls are practically worthless for poultry feeding, for they not only contain a very large amount of indigestible fiber but are made up of sharply pointed fibers impregnated with silica, and seem to produce an intense irrigation of the digestive tract of live stock.

Whatever changes in the ration are made should be made gradually so that the fowls will have time to slowly become accustomed to the new ration. Wheat has always been considered one of the leading poultry grains. The grain mixtures here suggested have been carefully formulated but we are unable to state positively at this time with the limited data available just how these rations compare with those using more wheat. Our knowledge and experience, however, indicate that they will give excellent results if carefully and judiciously fed.

CONTINUOUS

"Did you know," asked Mudry, "that Miller had married for the fourth time?"

"Well, anyhow," replied the other man, "it demonstrates the truth of an old saying."

"What is that?" asked Mulry.

"'The triumph of faith over experience'," was the reply.

GREETINGS

Traffic Cop—"Come on! What's the matter with you?

Truck Driver—"I'm well, thanks, but the engine's dead"!

Mileage!

SURELY you've noticed the ever-increasing number of Ajax Tires in use on your own roads. More and more the farmer who checks up his mileage turns to Ajax. He knows that the greater mileage we have built into the Ajax Tires, enables him to get greater mileage out of them.

AJAX ROAD KING

More mileage is actually built into the Ajax Road King by Ajax Shoulders of Strength—those buttresses of rubber that brace and re-inforce the tread. They are an exclusive Ajax feature—a scientific means of putting more rubber where it should be—more tread on the road.

Added proof of Ajax superior service is shown in the fact that 9 world's records and 49 track records were smashed in 1918 by dirt track racers using Ajax Tires.

Remember this—dirt tracks are merely country roads fenced in.

Ajax Tires will win for you. Use them.

Ajax Tires Are Guaranteed In Writing 5000 Miles

CATTLE

100 HIGH GRADE HOLSTEIN COWS AND HEIFERS
8 REGISTERED HOLSTEIN BULLS

ALL TUBERCULIN TESTED

AT PUBLIC AUCTION

NAPA STATE HOSPITAL, NAPA, CAL.

SATURDAY, MAY 3, 1919.
Beginning Promptly at 10 A. M.

The famous Napa State Hospital herd of grade Holsteins has been headed by registered Holstein bulls for the past 14 years and has been regularly tuberculin tested for the past 10 years. Last year the 117 milking cows and heifers in the herd averaged 11503.6 pounds milk. Every animal over six months of age in this sale is tuberculin tested.

The cows and heifers in this sale are out of the best grade cows in the herd, only the best producers ever having been retained, and they are sired by such registered bulls as Lord Asa, Prince Rag Apple Imperial Korndyke, and Colony Wadmantje Aaggie, whose dam made 18712 pounds milk and 781.25 pounds butter in one year as a 4-year-old and later made 33.01 pounds butter from 552.6 pounds milk in seven days.

The bred cows and heifers in this sale are in calf to the noted Napa State Hospital registered herd bulls, including Sir Dutchland Colantha of Longfield, N. S. H. Hazelwood Netherland Korndyke, and a son of Raphaella Johanna Aaggie 3rd, who holds the world's strictly official record for milk produced in one year.

A SPECIAL FEATURE—We will sell the twin yearling daughters of the great grade cow N. S. H. Monte who made 20,596.4 pounds milk and 762.28 pounds butterfat in 10 months in the California State Dairy Cow Competition, carrying a calf 5½ months, and they are bred to a son of Raphaella Johanna Aaggie 3d, the world's strictly official yearly milk record cow.

EIGHT REGISTERED HOLSTEIN BULLS, choice individuals and most of them out of official record dams up to over 29 pounds butter in seven days. Some of them are ready for service right now.

Come to the sale whether you want to buy or not. We believe you will be interested in seeing for yourself what the Napa State Hospital is doing to advance the dairy and breeding interests of California. Parties from the interior will find the new paved highway completed all the way into Napa.

Auctioneer—COL. BEN A. RHODES, Los Angeles; Sales Manager, C. L. HUGHES, Sacramento.

COMPLETE DISPERSAL SALE

THE JAMES McGILLIVRAY GRADE HERD

200 HIGHEST GRADE HOLSTEIN COWS AND HEIFERS

TUESDAY, APRIL 29, 1919

SACRAMENTO, CALIFORNIA

The James McGillivray herd of high grade Holsteins is known far and wide throughout central California as one of the heaviest producing herds in the territory, composed of young, well marked, good uddered cows that are the product of many generations of high class registered Holstein-Friesian bulls used on carefully selected dams.

Mr. McGillivray disperses this herd for the sole reason that room is needed for the expansion of his splendid herd of registered Holstein-Friesians which now contains around 250 head of females.

The unusual advantages which this herd of grades has had for many years in the use of the best sort of pure bred bulls is in large measure responsible for the present high character of the young cows and heifers in the herd. A very large percentage of the milking stock is first, second, and third calf heifers, and there is not a hard milker in the herd.

DAIRYMEN if you want real producers and money makers at the pail don't overlook the opportunity to buy them in this sale. They are well worth a trip from Imperial or Siskiyou, for this kind of grade Holsteins is practically never offered in such numbers, and the expense of shipping is only a very few dollars a head to the extreme ends of the state.

THE JAMES McGILLIVRAY RANCH is reached by going south on Twenty-first Street to Sacramento City limits, then continue straight ahead for two miles on paved Freeport Road. Look for sign at ranch entrance.

REMEMBER THE DATE—TUESDAY, APRIL 29.

Auctioneer, COL. BEN. A. RHOADES, Los Angeles; Sales Manager, C. L. HUGHES, 211 Ochsner Bldg., Sacramento, California.

For Sale—35 Head high grade Holstein cows fresh and close springers. Come and see a real bunch of cows. Cows displayed one-half mile west of Burbank on Shriner Ranch. Hannon Bros., Third Street, Lankershim. Care of Chas. Irwin.

Special Notice—Second farm sale—Shorthorns, Shropshires, Berkshires, Ponies SATURDAY, AUGUST 2, 1919. SHORTHORN CATTLE, SHROPSHIRE SHEEP, Berkshire Hogs and Shetland Ponies. Get our prices and descriptions before buying. Butte City Ranch, Box C, Butte City, Glenn County, California. W. P. Dwyer and W. S. Gulliford, Owners.

Shorthorns bred for Range Purposes and of Pure Scotch Blood Lines. Show Herd won highest honors in 1917. Visitors welcome, information cheerfully given. T. T. Miller, Hollister, California.

Elkhorn Farm Ayrshires — Choice registered young bulls at reasonable prices. J. H. Meyer, 440 Montgomery Street, San Francisco, California.

MISSION BRAND IN THE MAKING

Continued from Page 571

method of delivery, the stand being beneath the tree and at its lower side so that in turning the row with the cultivator, thorough tilth is kept up underneath the upper side of tree or end of row. This makes it necessary to back the water for a short distance, but the grades are so perfect that this is an easy matter, enabling perfect control of water with least expenditure of labor. In remarking as Mr. Chapman did: "Many of us use too much water", we take it he was simply getting away from the line of action of the party who observed: "Shentlemens, a leedle too much lager beer is shust right."

This year, with the trees of such age and carrying immense crops, there is being experienced some difficulty in securing sufficient size of fruit. An effort is being made to control this by the use of quick acting fertilizers and the giving of proper cultural conditions.

Once produced these oranges are given best of opportunity in the best markets which can be found. This best opportunity, as indicated above, includes care in harvesting, in delivery to the packing house, and in observance of utmost care in every detail as they pass through the house The character of the work done inside the packing house is apparent at the first look at the great plant because of its careful architectural construction and well kept surroundings. The packing house has the appearance of one of California's old missions, and the interior has every convenience for best handling of the great crop which is assured every year on this ranch.

The Tulare Cantaloupe Growers Association has been formed and hopes to increase cantaloupe production in that section.

FARM LANDS FOR SALE

ALBERTA THE WHEAT GRANARY OF THE WORLD AS CALIFORNIA IS THE FRUIT-BASKET.

We own and control several thousand acres in the choice farming districts of Alberta. Our improved lands are in farms of from 500 to 1600 acres and each farm has considerable acreage ready for spring crop. Our raw lands are in proved districts, surrounded by improved farms. FOR RENT

For Rent—240 Acres Santa Clara County, 5 room house, cabin, etc. Miss Archer, 204 Fair Oaks Street, San Francisco.

STOCK POISONED BY OAK LEAVES

Belief among many stockmen in the grazing regions of the West that cattle were poisoned by oak leaves caused specialists of the United States department of agriculture to undertake experiments in 1915, the results of which have just been published in Bulletin 767, "Oak Leaf Poisoning of Domestic Animals." It has been found that the continuous feeding of oak leaves produces sickness of cattle, which frequently proves fatal. In order to cause sickness, however, oak leaves must make up a large percentage of the ration. If eaten with other feed the animals are not injured. It was found experimentally that as small a quantity of alfalfa hay as three pounds daily, fed in connection with oak leaves, prevented poisoning. Most poisoning cases occur in the spring, because at that time there is a scarcity of other forage on the range.

Ask the Man Who Has Used Nitrate of Soda

Whether or not he has made good crops with Nitrate. Why speculate with Non-Nitrated forms of Nitrogen when by using Nitrate of Soda you can insure your crops? Nitrate of Soda leaves no mineral acid residue behind to injure the soil. It makes bigger crops—and keeps the land sweet.

Household Department

HIS DOG

He also serves who only wags and waits.
I surely sniff excitement in the air;
Perhaps he's coming home, if I could know!
But up and down the street, and everywhere
I've watched about a hundred years or so;
Yet somehow I expect him any day—
With shouts and cheers, as when he marched away.

And when I hear that whistle, and you see
A streak of dog in frenzied happiness—
You'll understand; he'll pat my head and say:
"Hello, Old Pal! you missed me some, I guess;"
I leap to kiss the hand—and then oh, boy!
I wonder if a dog can die of joy?
—Laura Simmons, in Life.

THE SINGLETON OAKS

By Samuel A. Derieux in Youth's Companion

IN KHAKI and leggings and broad-brimmed hat, Arthur Singleton stood halfway between the house and the road and directed three negroes who were plowing deep for cotton. Three months ago he had come home from the state agricultural college to take charge of the plantation; and even in that short time the results of his vigorous administration were visible.

The old hedgerows that had once stretched from the mansion to the big road had been cut; the site of the flower garden had been plowed under; an avenue of half dead trees had been removed and the driveway narrowed. Only the Singleton oaks remained. They bordered the road on either side for a quarter of a mile. Their rugged outlines were softened now by the filmy green tracery of early spring. On the topmost branch of the tallest tree a mocking bird poured out his joy to the morning.

As Arthur's father, Maj. Francis Singleton, came out on the big white columned portico and took his seat in the sunlight, he turned toward him. Then with a final look at the three negroes, who were shouting at their mules and who were plowing faster than they had ever plowed before, he strode toward the house. The major smiled as his son came up on the portico. Arthur leaned against one of the columns and looked at his father.

The young man cleared his throat. "I have decided," he said, "that those oaks out there on the road must go."

The old gentleman grasped his stick tighter and, with challenging eyes, glanced up from underneath his broad hat. "Why?" he demanded.

"They shade the cotton, father. Their roots rob the soil. The lumber company will pay well for them cut and hauled, and we need the money to meet the note for the fertilizer."

"Why, Arthur, do you know, sir, that those trees have been famous for two centuries, that travelers from afar have praised them, that Gen. Marion in the Revolutionary War used to rest his forces beneath them?"

"I know all that, father, but—"

"All these years," continued the major, not heeding the interruption, "they have blessed tired man and beast. Now that the forests are cut, they form an oasis along a blazing road. To cut them, sir, would be sacrilege!"

"That's sentiment, father."

"Yes, sir," admitted the major, "it's sentiment."

"Don't you think that sentiment has cost us enough in the past, father?"

Arthur flushed and checked himself. Perhaps he had gone too far. Under his father's mismanagement the original plantation had sadly dwindled. Notes signed without question for army comrades in need and for distant relatives had consumed hundreds of acres. In Arthur's opinion sentiment had been the old gentleman's besetting weakness, and he had come home firmly resolved to fight it. The fight was on, and he must win.

"You see, father," he continued, "we have to meet that note for fertilizer. You can't meet a note these days with anything except money. As for the oaks, I love them as much as you."

The major smiled a little bitterly. "Do you?" he asked. "You do not remember your mother well, Arthur. She died when you were quite young. She loved those trees. When she was a slender bride she used to walk under them. After you learned to toddle she took you out there." The major smiled. "Such a tiny tot under such giant trees—I see it all again. Those trees are entwined with the life of your ancestors. They—"

"Father!" Arthur interposed, more deeply moved than he would admit to himself. "You are getting away from the matter in hand. The note! I say we must meet the note!"

"Can it not be renewed? I know the president of the bank well. He comes of a good family."

"O father, you know nothing of modern business! A note promptly met means ready credit in the future, and that means everything to us! I have just begun this work. I must, I will, see it succeed—unless you, father, tie my hands with sentiment!"

"Are your hands so easily tied?" asked the major serenely.

Arthur flushed angrily. The impossibility of standing on common ground with his father in these matters stung him to a sort of desperation. He took a step forward and looked straight into the major's eyes.

"I took charge of the plantation under an agreement, sir. That agreement was that in matters of this sort I was to have my way. You said at the time it was a gentlemen's agreement, and—"

"Have a care, young man!" cried the major. "I do not need you to remind me that a gentlemen's agreement is binding. I might remind you, though, that there are certain tacit considerations—that a gentlemen's agreement is not to be pushed to its technical limits If so, it ceases to be a gentlemen's agreement."

"There's the note," Arthur said grimly. "Nothing except money will satisfy the note. I appeal to our agreement."

The major rose from his chair and, straightening his bent shoulders, looked Arthur steadily in the eye. "Do you interpret the agreement as meaning that you have a right to cut those trees?"

"Emphatically I do!"

"Then the oaks shall be cut. Hank!" he called to an old negro who just then came around the corner of the house. "Tell the boys first thing in the morning to get at those oaks along the road."

"What you gwine do wid 'em suh?" asked Hank.

"Cut them down."

"Cut 'em down! Cut 'em!" The old negro's jaw dropped in blank amazement, and his eyes suddenly grew big.

"They shade the cotton, Hank."

"But cotton grow up in a year, suh!" pleaded Hank, twisting his limp hat as if it were a rag. "It takes a t'ousand years to grow dem trees."

"The matter's settled. Tell the boys."

Hank, mumbling to himself, hobbled down the steps. The major went into the house.

Dinner that day was eaten in silence. Old Mandy, the cook, as she waited on the table, now and then cast angry glances at Arthur. Hank always sought the kitchen with his griefs and indignation. Arthur knew that most of the silent rebellions against his regime originated in the kitchen.

"I am going to Charleston this afternoon, father," said Arthur, when the meal was over. "I shall now be able to meet the note. It removes a burden from my mind."

"I am glad the burden is removed," replied Major Singleton. "You have worked hard, my boy."

That afternoon Arthur drove to the station and took the train for Charleston. He was going to attend to business, that was true; but if he had looked deep into his heart he would have discovered that he was in fact running away. He did not want to be with his father that afternoon, and he did not want to see the trees come crashing down in the morning.

Once in the city, however, his feelings changed. Here was life and stir and business. He walked briskly uptown. The sight of the cadets drilling in Citadel Square thrilled him. Like him these were clean-cut young fellows, members of a new generation, practical and efficient. Wtih a touch of pity he thought of his father and

the old generation that had dreamed away their lives.

He had turned into King Street when a touring car, spattered with mud and with a trunk strapped on behind, passed him. The driver turned suddenly and waved his hand to him. It was Fred Graham, an old college friend from the upper part of the state, in whose home he had spent Thanksgiving. Beside Fred sat Mary Graham, with her veil flying out behind. The car turned to the curb and stopped, and Arthur hurried toward them.

"Climb in," commanded Fred, as they shook hands. "We are taking our spring vacation trip. You must eat supper with us tonight."

As the car moved on, Mary Graham turned half around to him. Her cheeks were flushed and her eyes dancing. "You can't guess whom we saw this afternoon," she said. "We saw your father! I'm sure it was he."

A skeptical snort from her brother indicated that he was less certain.

"It was your father, wasn't it?"

"I don't know," said Arthur, laughing. "Where was he and what was he doing?"

Mary turned around and rested her little gloved hand on the back of the seat. "About forty miles back on the road, near Eutawville, we passed him. He and an old negro were walking along the road under a grove of trees. It was your father, wasn't it?"

With a sober face Arthur nodded assent. Mary turned to her brother triumphantly.

"I told you so," she said. "For one thing, Arthur, he looked like you."

At that moment Fred stopped the car in front of the hotel, and the conversation was interrupted. A few minutes later the three went into the large white dining room; they had it almost to themselves, for the winter tourists had departed and the travel to the coast had not begun.

"Now," began Arthur, when they had ordered supper, "tell me about father."—(Continued next week.)

BEAT HIM TO IT

The stranger on a walking tour came across an "old, old man a-sitting on a gate" and asked:

"You are a farmer, I suppose?"

"No, not now. I used to be, but I gave it up."

"Well, you don't seem to be very busy. You have plenty of time on your hands, haven't you?"

"Lots of it."

"Ever do any work?"

"Once I did."

"What do you do now, if I may ask?"

"Don't do nothing. Hain't done nothing for nearly ten years."

"So? Why, you're in luck! If I had done nothing for half that length of time I should be in the poorhouse."

The old man's face beamed with a glad surprise, and then, as one who knows his rare good fortune and values it at its just worth, cried delightedly:

"That's where I be!"—Pittsburgh Chronicle-Telegraph.

CALIFORNIA RAISIN RECIPES

Prize Raisin Bread

Soak one yeast cake in one and one-half cups of potato water; mix in enough flour to make a stiff batter; beat five minutes. Let stand over night. In the morning scald two cups of sweet milk, into which put one rounded teaspoon shortening, one tablespoon salt, three tablespoons sugar. When milk is lukewarm, mix with the yeast; add enough flour to make a stiff batter; beat about ten minutes; let rise. When sufficiently raised, add two cups seeded or seedless raisins; mix; add more flour and knead until dough is smooth; let rise. Make into loaves and bake one hour. When baked wet top of loaves with sugar and hot water to prevent the crust becoming hard.

Raisin Brown Bread

Two cups graham flour, one cup molasses, two cups corn meal, three cups sour milk, one teaspoon salt, two teaspoons soda, dissolved in two tablespoons hot water, one-half pound California seeded or seedless raisins. Mix well, put in mould. Steam two hours.

Raisin Spice Cake

Dissolve one teaspoon soda in one tablespoon boiling water and add to one-half cup molasses. Add one cup thick sour cream, one cup brown sugar, and three and a half cups flour. Beat thoroughly. Add one tablespoon each cinnamon and allspice and one pound California seeded or seedless raisins chopped fine and well dredged with flour. Bake in moderate oven one hour.

Raisin Cookies

One cup each butter and sugar rubbed to cream; add three eggs beaten thoroughly, two tablespoons thick sour cream, one-half leveled teaspoon soda, spoonful salt. Flavor to suit. Three cups California raisins, one cup crushed walnut meats. Add cup flour to raisins. Mix with other ingredients, then add flour enough to roll. Bake in moderate oven.

Selma Raisin Pie

Wash thoroughly two cups each seeded and seedless California raisins; soak several hours in cold water. Stew until tender. Then add one cup crushed walnut meats, one-half cup sugar, two tablespoons butter, two tablespoons cornstarch; rub to a cream with juice and rind of one orange and one lemon and part of grated rind, and cook until slightly thickened. Cool, and bake with a double crust.

Fowler Raisin Pie

Beat yolks of three eggs and white of one, keeping the remaining two for frosting. Add one cup sugar, one cup cream, sweet or sour (sour preferred), one-half teaspoon cloves, one cup seeded or seedless California raisins. Bake in rich pie crust in slow oven. When done, beat whites of two eggs until stiff; add two tablespoons granulated sugar. Place in oven and bake until light brown. This will make one pie.

Sanger Raisin Pie

One and one-half cups each California seeded and seedless raisins, three cups water, two tablespoons butter, juice of lemon, juice of one orange, one-half teaspoon cinnamon and cloves mixed, one tablespoon flour dissolved in water. Bring all to a boil, add flour dissolved in water. Sufficient for two pies.

Clovis Raisin Pie

Chop one and one-half cups seedless or seeded California raisins, one tart apple, one-half slice stale bread. Put in saucepan with one and three-fourths cups boiling water, one-half scant teaspoon salt, one-half cup sugar into which has been stirred one heaping teaspoon flour, one-half teaspoon cinnamon, one-fourth teaspoon cloves. Let cook ten or fifteen minutes, and before putting in crust add juice of a small lemon or sour orange.

Raisin Sandwich

Chop one cup California raisins and one cup walnuts very fine; add three tablespoons mayonnaise and one teaspoon lemon juice. Mix into paste, spread on thinly buttered bread. Splendid luncheon sandwich.

Raisin Ice Cream

There is no finer fruit ice than California seeded raisins added to ice cream of any flavor. Thoroughly dissolve finely chopped or ground raisins in the milk before putting in freezer. Use one pound raisins to each one-half gallon cream.

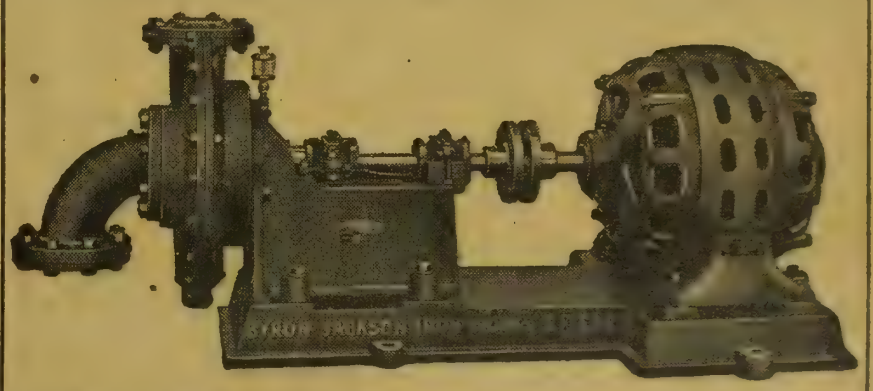
PIANO SATISFACTION

When you purchase a Piano it might as well be for a lifetime. A good Piano will serve a home faithfully through a generation—with it the children will learn music—grown to youth, they will play and sing the popular hits of the day as well as play the classical gems of the masters—and as old folks, they will delight in the music of days gone by. ***Such a piano truly becomes a lifelong friend.*** Therefore, when choosing your piano, choose it as you would your friends—consider dependability, durability, quality, character—so that your choice will give lifelong pleasure and satisfaction.



We offer several makes which have given lifetime satisfaction in thousands of homes all over the United States—they are priced reasonably—our terms will enable anybody to buy a good Piano.

We invite you to call at any of our stores—or write us asking for illustrated catalog and prices.

We are dealers in Steinway and other Pianos, Pianola and Duo Art Pianos, Aeolian Player Pianos, Player Music, etc.

Belgian hares 15.

LIVE STOCK

The undertone of weakness manifest in the market for dressed beef in Los Angeles is reflected in the prices now paid producers for live cattle. Forty-seven cars of fat steers left Los Angeles County last Saturday for the Kansas City market where good prices are now obtainable. Many more cars will follow in the near future.

It is hoped that when the local market is relieved of this surplus of cattle that better prices will be obtained locally.

Hog supplies are light. Prices are higher at this writing than ever before in the history of this state.

Liberal supply of spring lambs has tended to weaken the market on this product.

Ewes are scarce and those of good quality are commanding a premium.

Live stock prices April 9:

Good steers	12.00@12.50
Medium steers	11.00@11.50
Common steers	9.00@10.00
Good cows	10.00@10.50

No. 1 dairy	26.00
Standard dairy	24.00
Standard alfalfa	22.00

You Can Take Hills on High Without A Knock

If you will keep your motor free from carbon. That knocking in your engine—the difficulty you have climbing hills—poor pick-up—lack of power—noisy motor—pre-ignition—in fact 80% of your engine trouble is caused by carbon. Clean it out with

JOHNSON'S CARBON REMOVER

and your engine will run like it did the first 500 miles—quietly and full of "pep". And your gasoline consumption will drop 12% to 25%.

You Can Do It Yourself

For 65c—five minutes' time—no labor—and without laying up the car, you, yourself, can remove all carbon deposits. No mechanical experience required.

If you will use Johnson's Carbon Remover every 500 miles, giving carbon no chance to accumulate, you will automatically eliminate most valve trouble and your engine will always be clean and sweet.

For Tractors—Gas Engines

Johnson's Carbon Remover will also remove carbon from the motor of your tractor, giving it greater power and enabling it to work more satisfactorily and economically. It will make your tractor 100% efficient.

Johnson's Carbon Remover is recommended by many car manufacturers including the Packard and Studebaker Companies. Handled by all representative dealers and jobbers. Insist upon yours supplying you. For further information write

(A)

Citrus Trees of Quality

The buyer of orange and lemon trees should be as discriminating in his selection of trees as the buyer of live stock in knowing the pedigree of his hogs and cattle.

When you purchase of us, every opportunity is afforded you to learn the why and wherefore of their merits as to production and quality.

We have but a few thousand left.

Walker-Hubbard Nursery Company

HAY

Under date of April 12, Scott, Magner & Miller says:

Receipts past week 1495 tons. A slight improvement has been noticeable in the market, which is quite likely to show to better advantage shortly. The feature of the week has been the placing by the government of orders for shipment to New York of 3000 tons double-compressed hay, a like amount for Manila and Honolulu. These immense purchases together with shipments to Arizona, New Mexico and Texas during the past two weeks of several thousand tons more are bound to have more or less effect on the local market.

The weather has been most favorable for the growing crops and the cutting of first crop alfalfa as well as volunteer from the early sections is proceeding without interruption. Should we have a late rain however, which is to be expected any time, this early hay would probably be more or less damaged. To sum the whole situation up prospects for holders of hay are much brighter this week than they have been for some time past.

We quote today wholesale prices in carload lots as appear from dealers' transfers upon the hay market for prices to consumers charges of cartage, commission and handling expenses must be added according to conditions.

Under date of April 19, Scott, Magner &	
Fancy Wheat hay (light 5 wire bale)	21.00@23.00

Citrus Fruit Market

Los Angeles, April 23, 1919.

Auction markets show a material shading in prices. Conditions are generally fair with good demand for regular sizes.

The lemon market is rather better and higher prices are being obtained.

Shipments

Shipments of citrus fruits to date since November 1, 1918: Southern California; oranges 16,760 cars, lemons 3901, total 20,661. To same date last season; oranges 5875, lemons 2061, total 7936. Central California this season; oranges 3083, lemons 354, total 3437. Last season to same date; oranges 2384, lemons 115, total 2499. Northern California; oranges 244, lemons 2; last year same date, 202.

Up-To-Date Figures on Why Tractors are Displacing Horses on the Farm

If you own a small farm or orchard and are working it with two horses, you have an expense of 75 cents each or $1.50 per day, or $547.50 per year for feed alone, which bill goes on just the same whether working them or not. Besides this your harness bills and shoeing bills which will make the total about $600.00 per year.

COST PER DAY OF HORSES

Original cost of team, $200.00.	
Interest on investment—horses, $200.00 at 6 per cent	$ 12.00
Interest on investment—harness, $100.00 at 6 per cent	6.00
Feeding, shoeing, harness repair	600.00
Depreciation in value of horses at 10 per cent	20.00
Depreciation in value of harness at 20 per cent	20.00
Total	$658.00 per year,

or $2.12 per day for doing two horse work.

TIME CONSUMED WITH HORSES

Then you have to get up an hour earlier to feed, water, curry, clean out stable, harness and then hitch up. At noon, unhitch, water, feed, hitch up, 30 minutes. At night, unhitch, water, feed, bed down, 30 minutes, or 2 hours time per day.

COST PER DAY OF TRACTOR

With an AVERY 5-10 Model B orchard tractor it figures this way:

Original cost, $780.00 complete.	
Cost of fuel, 8-hour day, 6-gallon distillate at 13½c	$ .81
Cost of lubricating oil (best grade), 1 quart	.25
Cup grease and gear oil	.15
Interest on investment at 6 per cent	.13
Depreciation at 20 per cent	.43
Total	$1.77 per day

for doing four horses' work, compared to $2.12 per day to do 2 horse work.

TIME SAVED WITH TRACTOR

Thirty minutes a day is ample time for taking care of your Avery Tractor. Besides the above difference in cost you can sleep an hour later in the morning, and then save another thirty minutes of labor during the day, and then CULTIVATE TWICE THE NUMBER of ACRES PER DAY and RIDE ALL THE TIME you are doing it. Then when you have completed your work you can take a trip to the beaches or to the mountains and not have to hurry home to feed and water old Dobbin. BUY an AVERY 5-10 MODEL B ORCHARD TRACTOR and make more, save more, and get more enjoyment out of life.

Write for special literature—G-K—and find out why.

Some Tires "Climb"

DID you ever wonder why it is often so hard to "stay in the ruts" when driving over poor roads?

Usually you will find the reason in your *tires*. Many so-called non-skid treads tend to "climb" up the sides of ruts—the fancy bumps and ridges of rubber on the sides of the tread act like the climbers which telephone linemen strap to their legs.

HORSE-SHOE TIRES have no such tendency. They are anti-climb as well as anti-skid. They run true and straight on rough roads —and noiselessly on paved streets.

This is just one of the reasons why experienced motorists, when buying tires,

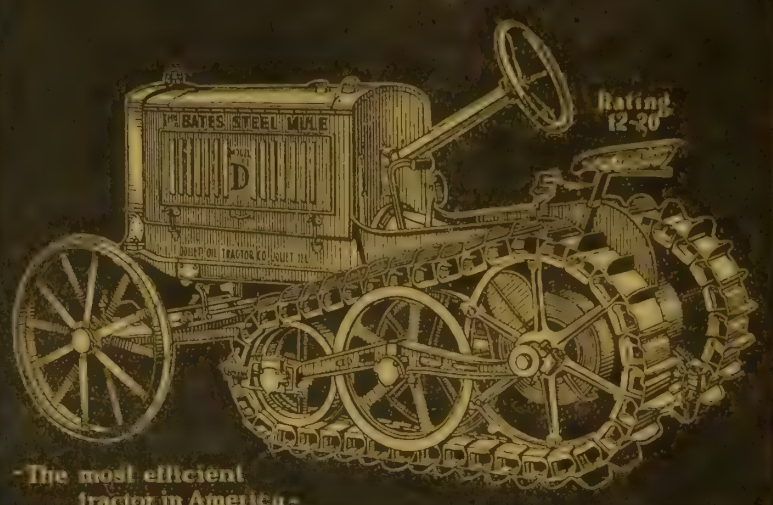
RACINE HORSE-SHOE TIRES

Uncle Sam Uses Crawler Tractors

Perhaps the most convincing proof of the efficiency of the crawler type of drive is the performance of the "land battleships" in Europe, the war tanks. The way these go through everything and over everything is truly remarkable.

In Uncle Sam's war work he used tractors of the Crawler type because he knew that they have the reliability and pull to get there.



The powerful twin crawlers of the Bates Steel Mule grip any soil with a firm hold so that the heavy duty valve-in-head kerosene motor need not waste an ounce of its power in uncertain traction.

Perforated Tree Protectors

that will keep squirrels, rabbits and gophers from barking your trees and give perfect protection from the hot sun, sand storms, raking bark in cultivation, etc. We make a number of kinds of wraps, among these are the Yucca which has the fastening wire entirely around it. Tell us your pest and we will tell you what kind to use.

Collapsible Planting Pots

These pots are bottomless. This allows you to plant pot and plant, never disturbing your plant nor stopping its growth in transplanting a single hour. For starting early vegetables, such as tomatoes, cabbage, egg-plant, cauliflower, cucumbers, cantaloupes and squash. Also, for propagating rose cuttings, geraniums, eucalyptus or olive cuttings. It is the most practical pot on the market today for propagating work. Write us for samples of either pots or protectors. Tell us which you are interested in.

Bees---Spraying

FRUIT growers generally understand the service which bees render to their industry. It is possible that in some cases there may be injury as a result of their work, especially in the case of drying fruits, but in the main, especially as to pollination, there is but little question of their beneficial activity. The bee keeper likewise is served by the fruit industry. He now comes, however, with appeal for other service to prevent poisoning of his bees which may result from poisoned sprays used at time fruit trees are in blossom, to prevent attacks of such insects as codling moth. A writer in the American Bee Journal, who signs himself F. C. P., discusses this matter at some length:

"Several letters have come to my desk of late which have to do with the poisoning of bees from the spraying of fruit trees while in bloom. In New Mexico it seems that a bill is pending in the legislature which provides a penalty for the application of spray poisons to the fruit trees before 90 per cent of the blossoms have fallen. A few other states have passed similar laws and several others, after considering such measures, have refused to enact them.

"At one time I used my influence for the passage of such a bill, in Iowa, although I must confess that I was not enthusiastically in favor of it. Since that time I have investigated the matter somewhat and now doubt whether such laws are desirable. Here in America we have come to look upon 'laws' as the cure for every ill. Every day we hear somebody say that there should be a law passed prohibiting this or that. Perhaps we will learn in time that the mere passage of a law does not always remedy our troubles.

"In the case of spraying, so many beekeepers report the loss of bees from the spraying of fruit trees while in bloom, that there must be some cause for complaint. However, it seems to me, after looking into the thing, that a law is not the proper remedy. In the first place, the passage of such a law is resented by the fruit growers as being aimed especially at them. Instead of developing harmonious action, it has the opposite effect. The interests of the fruit grower and of the beekeeper are mutual. It is recognized that bees are necessary to insure proper pollination of fruit blossoms. It is also taught by most entomologists and horticulturists that the best time to spray is after the petals have fallen. Not only may the bees be poisoned, but the fertilization of the blossoms may be retarded or to some extent prevented by spraying before that time.

"This being the case, what we need is not a law punishing the man who reduces his own crop and kills his neighbor's bees by improper spraying, but an educational campaign to give proper instruction in the application of the poison.

"The fruit growers ars as anxious to teach the mass of small orchardists to use spraying materials as the beekeepers are to induce every beeman to treat foulbrood. The enactment of a law prohibiting spraying at any time may easily discourage its being done at all. In this case the fruit business has been injured.

"There are few fruit growers progressive enough to spray their fruit trees, who will be purposely disposed to injure the bees on which they depend as an agency in the fertilization of their fruit. Instead of trying to force through a law against spraying while the trees are in bloom, the beemen and fruit growers should meet and agree upon a campaign of education in districts where spraying is improperly done. Such a campaign will result in great benefit to both the fruit grower and the beekeeper and should leave each with the best of feelings toward the other.

"When, as sometimes happens, the legislative committees ask for definite proof of the injury to bees from this cause, the beekeepers find it difficult to prove their case. Our senior editor once served as a member of an Illinois delegation to appear in behalf of such a measure. The chairman of the legislative committee was an extensive orchardist who seemed disposed to be very fair in the matter. He asked for proof of injury to the beekeeper, and when an attempt was made to furnish specific cases which could be laid to this cause, the beekeepers were unable to find them.

"We are a little in the dark as to just how much the bees are injured from this cause, and here is a place where our experiment stations can render some real service to both fruit growers and beekeepers by making extensive and careful tests as to the extent of injury, time when bees are poisoned, and also in searching for a remedy. Judge Taylor of Yakima, Washington, suggests that since the arsenate of lead is said to be sweet, the bees may be attracted to it at times when the trees are not in bloom. He also suggests the possibility of adding to the spray some repellent which is obnoxious to the bees and thus prevent them from taking it at any time.

"From Washington comes the report that the greatest loss is not at the time when the trees are in full bloom, but during the subsequent spraying for the second and third broods of codling moth. The injury seems to be worse in dry sections where water is not easily available, which indicates that the bees in search of water for brood-rearing at times suck up the newly applied poison.

"Until we have more definite information on which to base our demands for legal protection let us appeal for help to the extension departments of our agricultural colleges in spreading information, and from the experiment stations in ascertaining the true conditions."

Corrugated Iron Pipe as Well Curbing

Adaptation of high purity, rust resisting iron corrugated pipe to form a permanent well curbing is one of the unique developments of the last year or so in California, where water development in connection with irrigation projects is so important. The use of this material in the form of road culverts has become a standardized practice, and its adaptability in the sinking and maintenance of wells has indicated it possesses numerous advantages practically equal to its more familiar uses. The ability of corrugated iron pipe to resist external pressure is almost as important in the form of well curbing as in highway and railway drainage. Of course, since the pressures to be met by well curbing are entirely lateral, lighter and less expensive gauges of corrugated iron may be used than for road culverts of similiar diameter. In cases where wells are dug instead of being bored, because of the large cost of assembling well boring equipment and the need for a greater amount of water, which is made possible by a dug well, it is frequently necessary to go to a considerable depth in soil formation of not too stable character. Here the easily installed corrugated pipe forms an inexpensive and safe curbing, preventing cave-ins and delays. Once installed in the well it is a simple and easy matter to fix it in with concrete as a permanent wall.

Easily Handled

In such installations it is customary to excavate for a certain distance, then let down a 10 or 12 foot section of corrugated pipe and continue to excavate, allowing the pipe to settle as the work progresses. When the first section is finally below the surface a second one is placed on end over it, coupled and the work goes on to the desired depth.

Surface water is oftentimes quite objectionable. This condition frequently obtains for a considerable depth. Corrugated pipe as well curbing in such instances is exceedingly adaptable in excluding all the water that does not come from the desired level. Some interesting installations of this type have recently been made in California.

When Writing Advertisers Mention The Cultivator

required the pipe can be close riveted and soldered, but the most desirable and least expensive installation is made where the pit is lined with one-inch planks as excavated, the boards being held in place by iron rings of the proper diameter. Old wagon tires answer this purpose very well. Corrugated pipe of slightly smaller diameter is lowered into the well pit and the space between the iron and the wooden casing is poured full of concrete.

Typical Installation

This well was dug four feet in diameter and 42 feet deep. The pit was lined with one inch by six inch planks running vertically and held in place by old wagon tires, placed at five-foot intervals. To facilitate the installation of the corrugated curbing, a platform was built 14 feet above the bottom of the well pit. The last two feet of the wooden curbing above the platform had been cut away and an excavation made in the walls that tapered outward from the bottom of the remaining board curb and formed a shelf at the height of the platform, extending outward eight inches around the entire circle.

Solidly Concreted

This done, iron pipe, 42 inches in diameter and 28 feet long, was lowered to the level of the platform. Concrete was then poured from the surface to fill the space between the iron and wooden curbings. When the concrete had set the platform was removed. The entire structure which went to make up the well curbing—the corrugated piping, the concrete, and the wooden curb—thus rested securely on the shelf at the 28 foot depth, which was formed by the excavation at the sides of the pit.

In this particular installation it was found that the surface water had not all been excluded and that it continued to find its way into the well below the concrete. To stop this another iron pipe, 38 inches in diameter and 16 feet long, was lowered inside the first one. A similar shelf was made near the bottom of the well and concrete poured in the two inch space between the two pipes, 28 feet from the surface. For convenience in pouring the concrete, a round cover was made to set on the rodded end of the 42 inch pipe, and this was afterward cut down to permit its use on the top of the smaller pipe while the concrete was being poured. The installation has proved satisfactory in service and the well affords an abundant supply of pure water.

1919 STATE FAIR JUDGES

Secretary Chas. Paine of the state board of agriculture announces that he has succeeded in getting the following nationally known experts to judge at the forthcoming state fair:

Professor E. A. Trowbridge of the University of Missouri will judge the various horse classes, both heavy and light. Professor Trowbridge is admitted by all to rank among the most competent live stock judges in America and his work at the 1916 state fair was of such high order that he was invited in 1918, but could not accept.

Professor John Burns, head of the animal husbandry department, Texas A and M. College, will officiate in the beef classes. Burns is a western man who knows the types of cattle the west needs as well as any man.

Burns and Trowbridge judged the Hereford classes at the last Kansas City Royal.

Hugh G. Van Pelt, nationally known as an expert judge of dairy cattle, will tie the ribbons for all dairy breeds.

Van Pelt is the man who bred the Jersey bull Financial Sensation and sold a half interest in him for $30,000.

Secretary Paine is to be congratulated upon the class of men he seeks for judges. The swine judges will be announced later.

It is really surprising how much food in the form of green or salad crops can be grown in the spaces between the plants or rows of the larger or standard crops. For example, all lettuce and radishes required by the average family may be grown between the plants of early tomatoes.

A garden that produces only one crop and idles away half of the growing season does only half of its duty.

MOLINE GRAIN BINDER

Absolute dependability during rush of harvest season, plus service without delays or breakdowns makes Moline Grain Binders popular with every farmer who uses one. For over 50 years, Moline Grain Binders have been giving such service in all parts of the world.

Owners tell us without reservation or condition that Moline Grain Binders are positively dependable—that they are exceptionally light in draft, and that they do good clean work in all sorts and conditions of grain.

Moline Grain Binders give every owner the same dependable service.

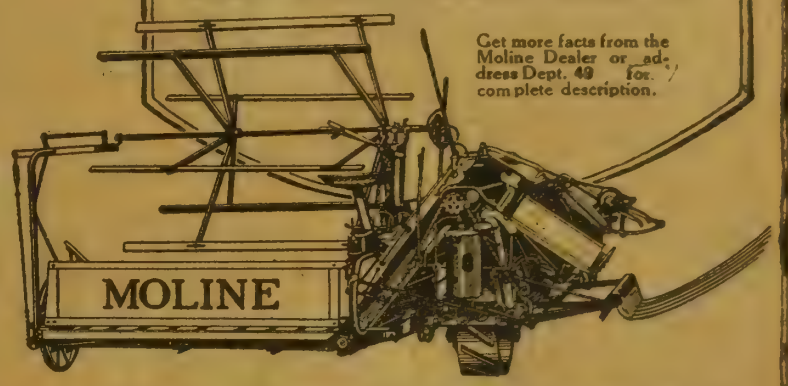
There are sound reasons why they do—

Cutting apparatus is the heaviest and strongest made. Heavy guards do not bend or break when striking obstructions in a close cut.

All working parts are direct driven, the work is equally divided, no over strain on any part.

The knotter has few parts, is simple and easy to adjust—a sure tyer.

Triangular driving arm on binder attachment takes place of troublesome, power-wasting, complicated gears, shafts and sprockets.



Single lever controls the reel in all operations.

Main frame made of two pieces instead of four.

These are just a few of the many superior features of the Moline Grain Binder.

The more you expect from a binder the better a Moline Grain Binder will satisfy you. Ask any owner.

E-B Quick Detachable Share, applied or removed in a few seconds without wrench or other tool.

E-B No. 102 Tractor Plow

E-B Sharp-Share Plowing Means Big Crops

E-B Sharp-Share Plowing means more soil turned, easier pull for the horses and, most important of all, *better crops*. It also assures more soil turned with less work on your part because of easy handling. **No land side friction—lubricated bearings.** Furthermore, E-B Sharp-Share Plowing allows free air circulation through the soil arteries, eliminates poisons, increases available plant food.

E-B No. 102 Tractor Plows, equipped with E-B Quick Detachable Shares, have yet to be equalled for quick, easy, profitable plowing. One pull of the lever locks or unlocks the E-B Share. It's a matter of five seconds to remove or replace a share. *Ask your dealer to explain the advantages of E-B Sharp-Share Plowing.*

Keep the Home Fields Earning!

This year, your car should be a more profitable proposition to you than ever. Europe is still looking to American farmers for food. And there's a ready market for everything you can raise.

Your car's a time-saver—a distance cutter. It will help you keep the home fields earning. But to get its best work, you must give it good tires.

You'd be surprised to know how many hundreds of thousands of folks—both in the cities and on the farms—have decided that United States Tires are the best tires they can buy.

This year the proportion of United States Tire users is even greater than ever. War and war work taught the good judgment of putting good tires under a car or truck.

There is a United States Sales and Service Depot in your neighborhood. There you can get good tire service and sound advice as to the best United States Tires for your own individual use.

United States Tires are Good Tires

California Cultivator

Vol. LII, No. 18 — Los Angeles, May 3, 1919 — One Dollar Yearly

California a Prime Factor in Tractor Industry

WHEN the power of the horse is secured through a combination of steel and gasoline, his bulk is compressed to the size of a small soap box. Storage for the "feed," or to be more plain, the fuel, used in the gas engine is likewise vastly reduced. The reduction in expense, or the economy secured in the use of the power of steel and gas, is vast in theory, and every day sees it

Benjamin Holt

nearer realization in fact. The improvements of the past three years have wonderfully extended the use of farm power, the greatest example of which is the gas tractor.

On another page Mr. De Camp gives some of the early history of the former century's efforts in England and America to secure the use of steam for facilitating farm operations. Following those experiments of the later sixties, which may be said to have been almost complete failures, there was a long period in which power farming was given little impetus. California may well be proud of the fact that it is responsible for much of the development which was finally made of the old steam tractor.

In the first place this state developed the combined harvester and thresher which required the power of 20 to 50 horses or mules to handle. The expense of the upkeep of so many horses, together with the horse killing proclivities of those great machines, naturally caused investigation as to the use of steam power. California factories soon had these big steam monsters taking the place of the horses and so successful were they that they were distributed to nearly all parts of the world.

It is a matter of sufficient interest to justify a bit of the personal history of four brothers who had a large part in the advancement and development of the California tractor. In 1869 Charles H. Holt established in San Francisco a wholesale house handling hardwood lumber, wagon and carriage wheels. This firm under the name of Holt Brothers is still operating in San Francisco. The real predecessor of the present great house at Stockton was the house which was established there in 1883 when Benjamin Holt came to the state and established the wheel factory. This was a partnership formed by the four brothers under the name of the Stockton Wheel Company, with Benjamin Holt in entire charge. This Stockton Wheel Company occupied a building on the northeast corner of Church and Aurora Streets, which is the present site of the main office of the Holt Manufacturing Company.

The firm started the manufacture of combined harvesters in 1885, and in 1892 Benjamin Holt developed the first successful side hill harvester. Going back a couple of years, however, in 1890 we have the year in which the company brought out its first steam traction engine.

Sons of the original Holt Brothers now hold the principal stock in the company. One of these is now a lieutenant in the ordnance department in France and another has resumed work after serving the country abroad. Others after honorable service for their country are now returning to aid in the management of the company's business.

We have asked G. M. Walker, secretary of the company, for information as to the development of the caterpillar type of traction, and Mr. Walker writes:

"The necessity for some other means of traction than is offered by wheels became evident when the big steam engines were sent down into the reclaimed tule lands of the California Netherlands to do plowing and harvesting. Wheels as wide as 18 feet on each side of the machine were used, but even these did not present enough surface in contact with the ground to prevent sinking. Mr. Benjamin Holt therefore developed the idea of a self laying track and invented the first track type of tractor which appeared as a commercial success early in the 1900's.

"The Peoria factory was established in 1910, this offering the first and up to the present time the only big company that has reversed the usual order of things, having been first established in the West and having extended its business and established a factory in the East.

"Mr. Holt is a very modest man, fighting shy of the lime light into which he has been forced by the fame won by "Caterpillar" tractors in the war and by the fact that this tractor furnished the inspiration for the famous British tanks.

From the beginning of the war deliveries of "Caterpillar" tractors have been made to France and England, many hundreds of these having been sent over for the hauling of ammunition and supplies, and principally for the handling of heavy guns through the mud of Flanders and under other difficult conditions where no other form of tractive power could be used successfully. When the United States went into the war it did so with a complete program for motorization that taxed the capacity of the Peoria plant, made necessary large additions to that plant and set a great number of other plants at work making Holt tractors, assemblies and parts.

Mr. Holt is still active daily at the Holt plant, continuing to direct experimental work at the factory and in the field and following with much interest all the tractor shows and demonstrations that offer an opportunity to study the development of the industry. He has held the office of president of the company continuously since the incorporation of the company in 1892.

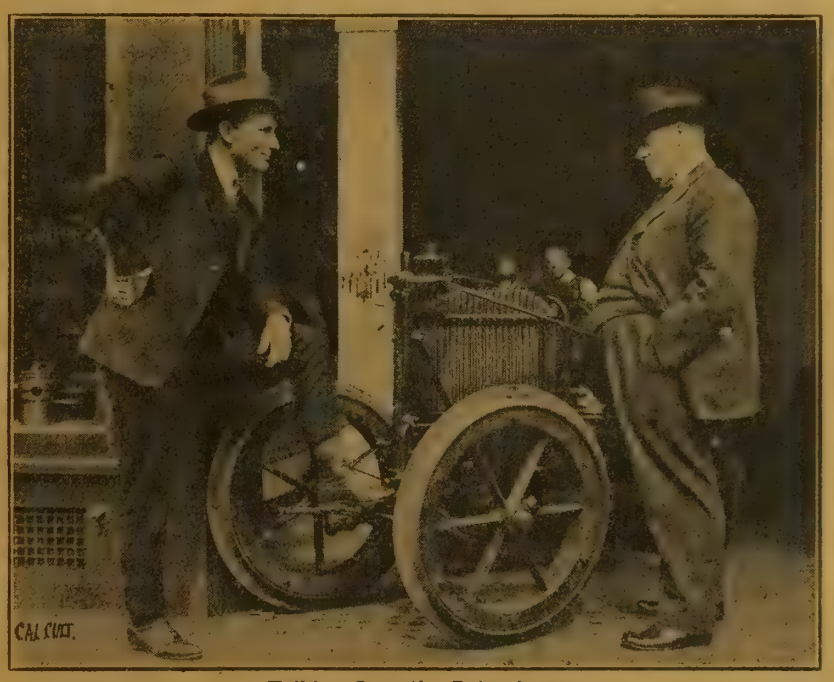
Every year sees new and extensive additions to the Holt plant at Stockton, and in Peoria additions which were started by the government during the war and now being completed will more than double the size and capacity of that plant.

Each of the two plants of the company today employs in the neighborhood of 2000 or 2500 men. Offices are also maintained at Spokane, Washington; Portland, Oregon; Los Angeles; Wichita, Kansas; San Francisco, and New York City. In Canada the company is represented by Canadian Holt Company, Ltd., and in England by "Caterpillar" Tractors, Ltd. It also has direct service and sales representatives in the Hawaiian Islands and agent representation in practically every country of the world.

* * *

There are in California, or rather were on the first of January, approximately 6800 tractors. There are, however, nearly a dozen other states which have a greater number of tractors than does California. For instance, there are in Illinois, 15,712; Indiana, 10,474; Iowa, 11,173; Kansas, 11,511; Minnesota, 8000; Nebraska, 9000; New York, 6000; North Dakota, 10,000; Texas, 11,000; South Dakota, 7000; other states running lower than California, with a total for the United States of 173,445.

* * *



Another most interesting character who realizes California's power farming possibilities and heads a large Eastern tractor factory, which is also located at Peoria, has visited the state so often that he is well known amongst tractor people:

Admires California

One of California's "steadies," J. B. Bartholomew, president of the great tractor company located at Peoria, Illinois. Mr. Bartholomew was here last year at the time of the California tractor demonstration at Sacramento, and from present appearances will be here at this year's demonstration also at Sacramento. It is possible Mr. Bartholomew primarily comes to attend our tractor demonstrations, probably because he like us, more probably because he simply likes California.

Mr. Bartholomew has been with the Avery Company since he was a kid of 16, and for nearly 14 years has been at the head of that great concern. During the first year of his presidency the business of the concern aggregated practically a million dollars and the average increase in that business up to the present time has been another million for every year. In other words, today the business aggregates approximately one million per month. When he went into the institution at the age of 16 there were approximately 50 employees; today there are 3500.

One of the slogans of the institution is, "There is a size Avery tractor for every size farm," from 5-10 to 40-80. In other words, there is an even half dozen of tractors put out. We are not informed as to which is the favorite with Mr. Bartholomew, but from his look of confidence in the little baby one, the 5-10 size, by which he is standing in his photograph, we believe he has a big place in his heart for that "youngest" member of the family.

Talking Over the Baby Avery

J. B. Bartholomew and W. W. Rainey discussing the good points in the baby 5-10. Mr. Bartholomew, president of the Avery Company, is just remarking that "Amongst ourselves we may call it the baby but when it comes to work it does a full size man's job." Mr. Rainey is manager of the Los Angeles house.

Some Load of Hay

This is labor saving when one tractor takes five trailers to market with such a load of wealth.

Agricultural News Notes of the Pacific Coast

Northern California

Placer County reports big fruit crop.

Butte County almond growers state: "Almonds looking fine."

It is now proposed to open the Placer County Fair on Labor Day.

Great crowds attended the University Farm Picnic at Davis on April 26.

Plantings of rice are being made in the red hill land near Oroville, Butte County.

The first bale of cotton ginned in Butte County is to be exhibited at Oroville.

The Eldorado center of the farm bureau held its first big auction sale on April 25.

The alfalfa meal mill at Orland, Glenn County, is now beginning its season's run.

A poultry campaign will feature the May meetings of the Eldorado County farm bureau.

A large planting to rice will be made this spring in Placer County near Lincoln.

Many farmers near Gridley in drainage district 833 are opposing bonds for further drainage.

Contrasts for Bartlett pears have been made in Butte County recently for from $60 to $70 per ton.

Eldorado County last season shipped out to Eastern markets 307 carloads of fresh deciduous fruits.

Members of the Mt. Vernon farm bureau, Placer County, are doing volunteer work on the roads.

Sonoma County will hold a good roads bond election May 31. The proposed issue is for $1,643,000.

The cattle inspection board inaugurated inspection of cattle at shipping points in Solano County on April 25.

C. J. Evans, poultry expert of the federal government, is looking over the poultry situation in Placer County.

Placer County last year shipped out 4394 carloads of fresh deciduous fruits, more than one thousand in excess of the preceding year.

The Mt. Vernon farm bureau has completed plans for the establishment of a central fruit packing plant at Auburn, Placer County.

The Plumas Cooperative Stockmen's Association has elected William Bills and George Ross of Wyandotte, president and secretary, respectively.

The Glenn County Fair Association has named two permanent stock judges: Prof. J. I. Thompson for swine and Frank Brown of Oregon, for beef cattle.

Manager Coykendall of the California Prune and Apricot Growers Association has been discussing work of his association with growers of Solano County.

The California Poland-China Breeders' Association is planning to hold a number of sales throughout the Sacramento Valley to promote interest in their breed.

The postponed annual meeting of the California Wool Growers is being held this week at University Farm, Davis. Fred A. Ellenwood of Red Bluff is president of the association.

An application has been filed with the state water commission for 1000 second feet of water from Feather River canal for irrigation of 12,000 acres in Butte County and 8000 acres in Yuba County.

Central California

Tulare County has just finished construction of 223 miles of concrete highway.

Turlock is to have a sweet potato curing and storing association and warehouse with capacity for 100,000 bushels yearly.

A Norwegian fruit handler has been investigating apple conditions in the Pajaro Valley. It is expected large shipments will be made to Norway next fall.

San Joaquin Valley fig growers are in arms because a New York importer has advised buying of high quality imported figs and refers to "gnashing of teeth among the jobbers who have loaded up on the California kindling wood."

A. F. Wells of Porterville has a small fortune in pomegranate trees under cultivation on a city lot. There are 10,000 of these trees raised by Mr. Wells as nursery stock. They are of the Wonderful variety and are valued at 50 cents each.

An exceptional condition exists in many parts of the valley in connection with the almond crop. Growers are reporting that the trees have set full of nuts but that numberless birds, principally linnets, are destroying the almonds. The birds peck a hole in the young and tender nut and extract the kernel through the opening.

Two cars containing between $8000 and $10,000 worth of yearling Hereford bulls of bluest blooded stock were received last week by Gill Brothers of Exeter, cattlemen who own several large ranges in the Yokohl Valley and in other parts of the northern and eastern part of Tulare County. Two of the young bulls came from Ames, Iowa, the others from Newman, California.

The Kings County supervisors are consulting District Attorney Ferguson about the drafting of an amendment to the county traffic ordinance designed to more strictly limit the weight of loaded trucks that may pass over the county highways. At present the load is limited to four and one-half tons but nowadays the truck weighs more than its load and the supervisors declare that unless something is done the highways may be damaged almost beyond repair.

The breaking of record prices for fat hogs goes merrily on these days. A record of $17.30 per cwt. established at Tulare some time ago was broken a few days later by the receipt of $17.45 per cwt. in Visalia. This record was in turn shattered in Tulare when $18.40 was received by the farmers at a farm bureau auction. Comes now Visalia with a new high mark of $18.45 received at a farm bureau sale the next day. So far as is known this is the highest price ever received for fat hogs in the San Joaquin Valley.

H. E. Wood of the firm of Wood & Stevens, New York brokers of the Associated Raisin Company, is now in Fresno conferring with officials of the company regarding selling the 1919 crop of raisins. Mr. Wood is enthusiastic over the market outlook, declaring that the demand for dried fruit of all kinds is unprecedented. He states that New York will handle enormous quantities of dried fruit this year, wholesale and retail stocks having been practically exhausted by a heavy export business during the late winter and early spring.

Southern California

Redlands expects exceptionally large apricot crop.

Ranchers of Imperial Valley have formed an organization.

Riverside County is planning for a milch goat show in October.

Cannery managers are calling on apricot growers in the Hemet district to thin fruit at once.

The Brawley farm bureau is planning an excursion through the northern end of the valley May 5.

One or two trainloads of cattle are being shipped weekly from Imperial Valley to Kansas City stock yards.

The Hemet-San Jacinto Growers' Association is making improvements to the extent of $30,000 in its cannery

Directors of the San Bernardino County farm bureau have gone on record as favoring the organization of a state farm bureau.

More alfalfa seed was sown in the Imperial Valley this year than any preceding year, according to a large seed dealer of Yuma.

Plans for making the citrus institute a regular feature of the orange show at San Bernardino are being formulated by Dr. Webber.

Walnut spraying to control aphis and codlin moth was demonstrated by Prof. Ralph E. Smith at Tustin, Orange County, on last Saturday.

Spraying demonstration for control of red spider on walnut trees was held at San Juan Capistrano, April 20. It was in charge of Farm Adviser Wahlberg.

Onion growers of Coachella Valley have decided on marketing grades. Examination of the packs will be made by a special onion inspector appointed by the state horticultural commission.

The San Bernardino County Poultrymen's Association reports a rapid increase in the industry in their county. The association has headquarters at 765 Third Street, San Bernardino, and E. Hyles is in charge.

The Riverside County farm bureau is making plans to purchase pure bred Holsteins, Guernseys, Jerseys and Ayrshires to be distributed to members. Farm Adviser Scribner of Los Angeles is aiding them.

Ventura County farm bureau meetings: Camarillo, May 6; Fillmore, 8; Wheeler Canyon, 12; Oxnard, 13; Saticoy, 19; Mound, 20; Moorpark, 21; Santa Paula, 27; Bardsdale, 26.

Fifty carloads of Small White beans were shipped from the Lompoc and Santa Maria fields last week to fill government orders. This is the first of the 1918 crop to be sold from this district. The bean acreage this year will be 7000 less than last year.

The Beekeepers' League of Southern California met at Riverside recently and elected E. J. Atchley, president; H. T. Baudy, vice-president; E. R. Butt, second vice-president; Geo. B. Gibford, secretary; Mrs. Geo. B. Gibford, assistant secretary and treasurer.

To settle the question of whether early or late planting of Limas is advisable careful records are to be kept by the bean men of results this year from the different plantings. Many plantings were made on the Irvine Ranch in Orange County during April.

The Coast and General

Large shipments of sulphur are to be made this season from the Aleutian Islands.

Many people of the United States are exercising homestead rights to lands in Alaska.

Alaska maintains that she has sufficient wealth to pay the entire nation's war debt.

Bellingham, Washington, planted this season extensively to raspberries and loganberries.

Utah dairymen are finding exceptionally fine results from feeding sunflower silage to dairy cows.

The Turkish fig crop in 1918 was 18,000 tons, according to figures by American consul at Constantinople.

The Apple Growers Association of Hood River, Oregon, assesses penalties on members guilty of "disloyalty."

Unusually cold nights in northern Arizona have been unfavorable for young lambs, but ranges and stock are improving in all sections.

The State of Chihuahua in Mexico has shown big yields of all crops for 1918. 935,000 bushels of corn were raised, 700,000 bushels of wheat.

Citrus growers of Florida have organized an association, or protective league, in the endeavor to stop promiscuous stealing of fruit by tourists and others.

Large purchases of Hood River apples have been made by English buyers. A sale of 10,000 boxes has just been reported at an average per box of $1.75.

The secretary of agriculture has approved 105 federal road aid projects during the month of March. This work will cost approximately $14,500,000.

Under the Yuma project in Arizona there are 844 farms. Five hundred and five of these are operated by the owners and 339 by tenants. Dairy cattle number 1875.

Alaska is encouraging more general use of reindeer which were introduced to that country in 1892. There are now 120,000 head in use, mostly by Esquimaux.

There is to be a meeting of live stock men in Salt Lake City, July 21 to launch a formal campaign for federal control of unappropriated public domains in Western states.

A committee known as the Western States Agricultural Committee is circulating west of the Rockies a petition which is to be placed before congress, and will ask that the importation of Chinese labor be permited.

Seven central fruit packing houses have been incorporated in Niagara County, New York, as a result of the activities of the county farm bureau. These seven associations this year will pack approximately 120,000 barrels of apples, 50,000 bushels of peaches, 12,000 bushels of pears, and will sell cooperatively 135 tons of grapes.

C. I. Helm, one of the best known nursery men of Arizona, died suddenly of heart failure April 13. Mr. Helm was a former resident of the state of Washington and served as state senator in that state. He was very much interested in the improvement of citrus fruits and perhaps did more than any other one man in Arizona to secure buds of best citrus trees for propagation.

The Evolution of the Tractor

By James De Camp

FOR the many who are prone to regard the tractor as a product of the last four or five years it is somewhat of a surprise to know that power cultivation was attracting a great deal of attention in the United States as long ago as 1858.

The modern "steel horse" which is revolutionizing present day methods of agriculture is of ancient and honorable lineage. Its forebears were snorting noisily and clumsily across the landscape of several Middle Western states when Thomas A. Edison, a youth in knickers, was conducting dubious experiments in the family cellar, laying the foundation of that wonderful knowledge which later bathed the entire world with the magic glow of electric light. Queer, ponderous prototypes of the tractor were wrestling with the soil while the great Lincoln guided the ship of state through the troubleous times of the Civil War.

Every object in nature, whether animal, plant or human, passes through a spindling, unlovely, uncertain period before it reaches the perfection of usefulness. The natal period of cultivation by power brought forth a fearsome menagerie of queer looking creatures, some almost as large as a bungalow and others constructed in designs so weird that their appearance would make the village toper think he was "seein' things again."

Most of these earlier contraptions soon drove themselves to the junk heap by reason of their weight and limitations, but to them belongs the honor of siring the later types which have gradually become so perfected as to be a necessity to the modern farmer.

In the middle of the nineteenth century the internal combustion engine was as effectually concealed in the mysterious future as the wireless and the aeroplane. The motive power of the day was steam and the designers of the early types of machines were forced to concentrate much of their effort upon devising steam power plants light enough to be feasible for purposes of cultivation.

The efforts of this period fall into two general groups, known as the direct and the roundabout methods of power cultivation. The latter was extensively used in England and consisted of drawing the implements back and forth across the field by means of a cable attached to the drum of a stationary engine, or pair of engines as the case might be.

In some instances the cable was a half mile long, being drawn by engines placed at opposite ends of the field and moved as the work demanded. By using a system of pulley sheaves and alternate drums a one-engine plant could be installed in such manner as to drag the plow or implement about the entire circumference of the field. Before this operation could be repeated it was necessary of course to readjust the pulley sheaves for the next furrow, an operation requiring quite a little time and capable of causing great danger if improperly attended to.

The indirect method called for a staff of engineers and helpers that would have bankrupted the most prosperous establishment. The workers needed were a chief engineer, second engineer, plowman, assistant plowman and two boys. Fifteen hundred-weight of coal, on the average, was consumed by one of these plants in plowing ten acres, the expense and complication causing this method of procedure to fall into early discard with the exception of a few isolated instances.

Turning to what was known as the direct method we come to a closer forefather of the tractor in that this type of plant actually proceeded across the ground to be tilled by means of its own power. The first of these to attract widespread attention was the Fawkes' steam plow which made it debut in 1858 at the Illinois state fair, held in Centralia. This monster unit weighed ten tons and covered a space 18 by 8 feet. On this platform was mounted a boiler six and one-half feet high containing 220 one and one-half inch tubes. The steam was shot into a pair of nine-inch cylinders, the power being transmitted from the pistons to a driving drum which took the place of wheels. The boiler of the Fawkes' invention held 12 barrels of water and required refilling every three hours, a tedious and toilsome operation. Four thousand dollars was the price which Mr. Fawkes set upon his machine and he received an award of three thousand dollars from the Illinois State Agricultural Society for producing the first feasible power plowing apparatus. The huge proportions and weight of this pioneer brought it into early disrepute since it was well night immovable once it ventured upon soil a trifle too soft to support its ten tons.

Two other inventions which clamored for public approval about this time were the Wilkins' steam plow and the A. J. Stevens' steam cultivator. The former was equipped with a murderous looking drive wheel fitted with curved spike teeth. The Stevens was propelled in much the same manner, an elaborate and complicated system of gears carrying the power to the drive wheel. Contemporary to these we must mention A. L. Taveau's steam plow, a creation reminding one of a circus calliope and getting traction from a pair of drive wheels designed to "bite" the ground.

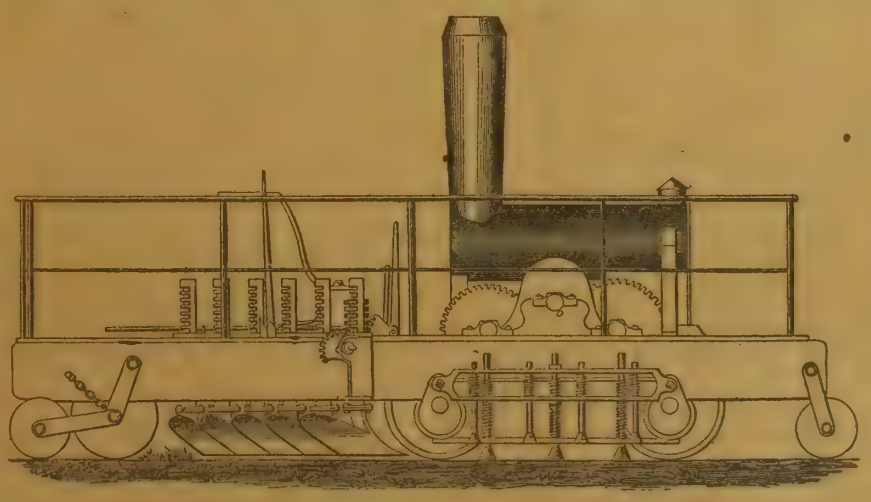
Perhaps the most novel of the bunch was the "Townley and Friedrich's." This queer monster forged ahead by use of a series of gear driven "feet" which exerted a downward and backward pressure on the same principle as the mechanism of walking dolls. The body of the machine was suspended on broad rollers, the whole ambling forward as one set of feet pressed down against the ground while an alternate group were pulled up preparatory to the next "step."

It is interesting to note that a steam machine invented in 1870 by Thomas H. Minnis embodied the endless track principle which is now so popular and which made the "tanks" so effective. In the Minnis machine power was furnished by a 15 horsepower engine driving, by means of chains, an elliptic track gliding over rollers. These tracks could be operated both forward and backward and also singly when the occasion demanded.

Steam tractioneering is said to have reached its peak in 1871, when some 13 arrangements were patented. Several of these were as amusing as a Keystone comedy, one making use of a set of imitation legs provided with blocks shaped like horsehoofs.

Weight, crudity and the difficulty of transporting sufficient water to the scene of action when the boiler ran dry caused these early types to fall into disfavor. While some engineers pursued their investigations undaunted many turned to other lines of endeavor, convinced that "mechanical horses" were impossible because of the great weight of the steam power plant.

The gas propelled tractor seems to have duplicated the experiences of Topsy; it "just growed," hurrying along in the wake of the tremendous progress made by the automobile. The first gas engine tractor was placed on the market in 1893, but was less successful than the steam tractor because of the crudity of the gasoline engine at that time. Most authorities agree that the first really practical gas tractor was produced in 1903.



Ever since that time the tractor has offered advantages induplicable by the horse but farmers, ranchers, experts and all concerned seem to have exercised a goodly amount of old fashioned Yankee caution regarding the perfected machine. As late as 1916 the year book of the Department of Agriculture made the following statement: "The position of horses on the farm is being contested by the small tractor and the tractor manufacturers believe that in time they will displace them. * * * This question can be answered only by speculation."

Today it can be stated without speculation that every up-to-date agriculturist in the United States is operating one or more tractors, that many scores of makes are upon the market, that the deliveries each month run up into the thousands, that the tractor has been found an interest bearing investment—in short that the idea born in the minds of Fawkes and others over 60 years ago and expressed in the lumbering models of that day has caught the stride of the times and come into its own.

Sleds In Loads of Wood

Pulling the old "stoneboat" loaded down with green wood is slight work for the tractor. This scene is on the place of C. C. Chapman in Orange County where Mr. Chapman is taking out walnut trees in order to make room for more Valencias.

The Tractor of Yesterday

Today we have our big wheelers, sieve grips, various track layers, among which is the Caterpillar. In the beginnings of steam plows they tried another type of traction. The above is an illustration taken from the Yearbook of 1865 of the Townley & Friedrich Steam Plow, patented April 27, 1869. Description is given in text herewith, but be sure and note the manner of propulsion. Moderns would probably call this the "Centipede" for it is propelled by a series of "spring feet" operated by eccentrics which would give a genuine walking motion.

THE TRACTOR

I sprang from the soil that I till.

I am fashioned from the elements—sired by the roaring furnace and the crucible.

When the gears mesh deep down in my vitals I throb with the strength of Titan and the courage of the ages.

With fuel and oil in my great belly and the hand of a man at my helm hell itself is but a cardboard barrier.

I am the equal of a dozen horses.

I know not fatigue while my great joints are oiled and my tank filled.

But I must have a considerate master. I will disappoint the boor who insults me with ill care and abuse.

I delve deep into the earth, toiling overtime that my master may have money for Uncle Sam's bonds and stamps.

I come of a fighting family.

The tanks are my cousins. They turned the tide of battle back toward Berlin when the Huns were nearing Paris.

Man is barely beginning to realize my usefulness.

Ripping and smoothing the soil is but one of my accomplishments.

I delight in giving power for odd jobs about the farm.

I haul heavy loads to market without rest or whimper.

The joy of achievement is mine.

I am athrill with energy from radiator to tail-bolt.

Where there is hard work to do you will find me.

I am the tractor.

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertisers in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

THIS WEEK'S COVER

The poster of the California Tractor and Implement Association has place of honor on the cover of this issue. The tractor and truck people are giving the appearance of a great gala day or, rather, seven days, to the great demonstration which will be held all of next week in or very near the city of Sacramento. We say they are giving the appearance of a gala week to this great event, but in reality it is the greatest business event of the year for these dealers.

The tractor school brings out the educational side and business is strictly taboo, but demonstration is made of every phase of the tractor industry, and every moment of the time from start to finish will be given up to tests of the power of the tractor to do any kind of work which the prospective customer asks to have done, and the proposition is that it will do it so well that a sale is bound to result. In any case, hundreds of tractors are sold at these demonstrations.

MORE ROADS

There was never a period when there was such general interest in highway construction as during the past few months. The post office appropriation bill calls for the expenditure of $209,000,000 in the extension of post roads, and it is estimated that during the coming year there will be approximately a half billion dollars spent from federal, state and local funds in giving employment and in improving our highway system. No state is planning for a greater campaign than is California.

BY THE TRACTOR FOLKS

The Cultivator has much pride in the great amount of space giving tractor information in this issue. Power farming never advanced with such strides as within the past few months, but as great as has been that advancement the coming 12 months will show vastly greater advancement. And in the matter of education of the producer as to the economy and efficiency of power farming, we are glad indeed to give place this week to statements by several of California's tractor handlers. Some of the talks are most informal and have a "just amongst ourselves" flavor; others have taken the farmers into their confidence and give practical workaday suggestions. We believe that we are justified in saying that no similar amount of information has been gathered in this field.

RECLAMATION SOLVED

One of the most important measures that has ever passed the California state legislature is the Purkitt bill which carried in the assembly by a majority of 55 to one and in the senate by a majority of 31 to five.

This bill calls for the expenditure by the state of $3,000,000 for the completion of the by-pass system which provides for the complete control of the flood waters of the Sacramento River.

Over 50 millions has already been spent by the farmers along the river. The passage of this bill is the result of an understanding among all of those interested in agricultural development in 14 of the 52 counties of California. There has been more or less discussion and dissension among the various districts involved, with prospects of litigation and the lack of progress and development that would result from this.

The legislature of California has proven by the almost unanimous passage of this bill that it is anxious to do everything possible to bring about the rapid and permanent development of this rich area. All that the Purkitt bill requires now is the signature of Governor Stephens. The increased revenue that will come to the state because of Sacramento River lands—which will now be provided for—will be enormous.

CONSTRUCTIVE OR NOT?

The Pendergast bill creating a new department of agriculture in which no fewer than twelve separate departments are consolidated was passed by the legislature and the bill now awaits the signature of Governor Stephens to become a fact. As stated, 12 existing departments are combined in one consisting of two branches, namely, a bureau of animal industry, and a bureau of plant industry.

The bill provides that the new department will be under a commissioner of agriculture who is to be appointed by the governor. Fundamentally, the plan is sound and is to be commended, provided that the governor recognizes the opportunity and responsibility resting in his hands to do the agricultural interests of California a real bit of constructive service. The new law may be constructive or destructive to agricultural interests—it all depends on the kind of man appointed.

BUY A "VICTORY"

A year ago today we were reading: "Hun's gun throws shell into Paris;" "Germans smash Allied lines near Hangaard and Somme;" "British and French clinging desperately to lines in Picardy;" "Small units of American overseas army training in quiet sectors."

Twelve months have made wonderful changes and the hearts of Americans are not sinking as they were a year ago. The best of it is we are thankful enough to put a litle more into Victory Bonds which will help pay for the victory won.

THE GRANGE

The National Grange Patrons of Husbandry has decided to make itself more of a factor in national life than it has ever been. This organization, in existence for more than 53 years, has been a power in bettering the condition of the farmer. Almost every state of the Union is represented in its membership. It refuses to allow partisanship to enter its discussions, but it now proposes to be more of a force in national affairs. To that end it has established in Washington permanent headquarters which will be used for the purpose of "inaugurating a practical, if not radical, legislative program". It is asking congress for legislation which will be of benefit to all the farmers of the country. Thomas C. Atkeson, master of the West Virginia State Grange, is in charge of the office.

One of its sincere friends gives the following tribute: "Founded in the first place upon broad ethical principles, standing always for man's best nature, emphasizing the importance of morality, education, kindness to others, it has come down unscathed to the present generation, although at times threatened to be wrecked on the shoals of selfishness of some of its members. It has lived through the dreaded 'boom period', that infantile disease likely to attack all new organizations, has survived the second summer of reaction after the boom, and today is in a remarkably healthy condition both as to membership and finances. That it is by no means full grown is testified by the enormous increase in number of Granges and in membership during the last five years. That the next five years will see even larger growth is the confident expectation of those who are best informed as to the merit of the cause which the Grange espouses."

DRYING WINE GRAPES

The state board of viticultural commissioners is issuing a statement as to the outlook for wine grapes. The commission states that while it is yet somewhat uncertain as to where the industry will be after July 1, they deem it wise to suggest to the growers that, excepting for the small quantity of grapes which may be used in the manufacture of pasteurized grape juice and grape syrup—and both of these the commission thinks of little importance to the industry—the bulk of the grapes be dried in the hope of development of export or other trade for them. The commission advises that it has made investigations and is prepared to give information to growers as to the manufacture of grape juice and grape syrup. The commission reports that several sales have been made of the dried wine grapes at six and a half cents a pound.

TRACTORS IN CALIFORNIA

Answering our request for information as to the number of tractors in California, Prof. J. B. Davidson of the University of California writes:

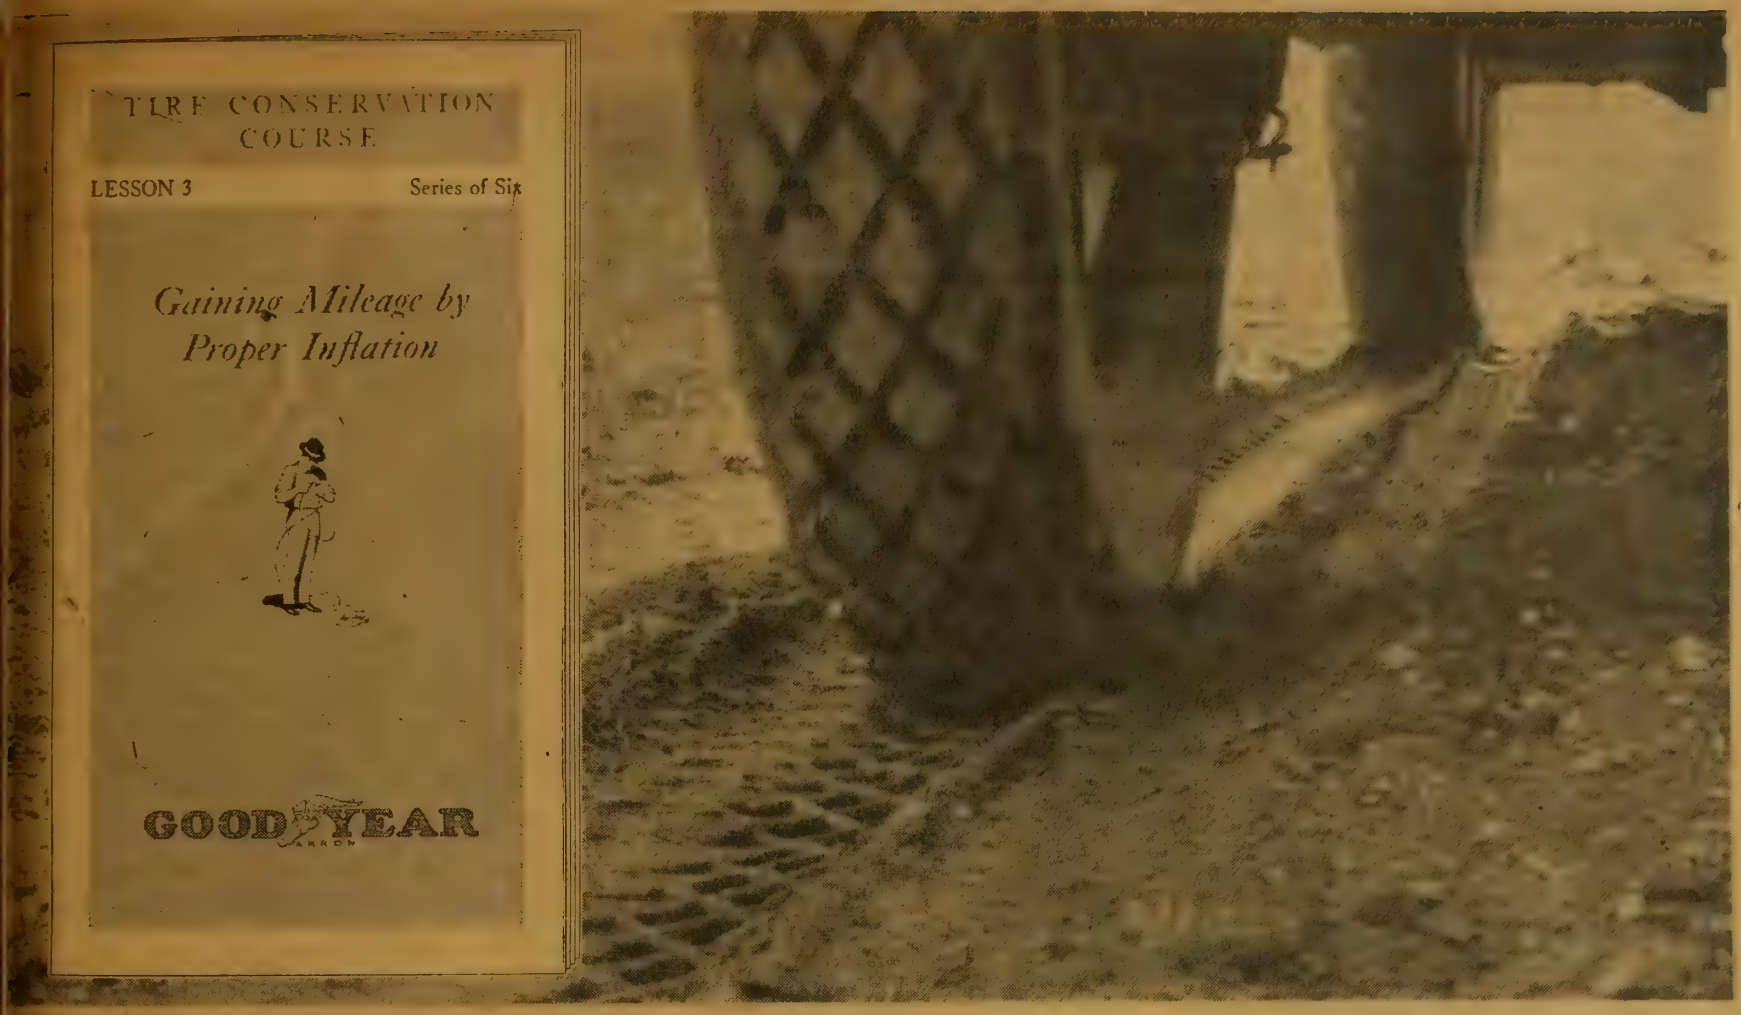
"In 1917 the state council of defense made a survey of the state, securing from the manufacturers a list of all sales. At that time they determined there were a few less than 4000 tractors in the state. It has been estimated by securing data from the manufacturers that 800 were sold during the last six months of 1917 and 2000 during the year 1918. This would make a total at the close of the year of 6800 tractors."

THE FARM PICNIC

Almost everybody went to the farm picnic at Davis last Saturday. At least it seems so from the photo of the autos parked in the usual green in front of the dormitories. The Cultivator was there with its camera, but this issue is given so largely to the tractor and the truck and power farming that the account of the picnic is deferred until next week.

CHINESE EGGS

New York had her experience with Chinese eggs this year. Eight thousand miles from the hen to the kitchen is certainly long distance shipping and with the facts that these eggs are much smaller than the American produced eggs, the whites weak and watery and candling shows material shrinkage and drying out, it is to be wondered at that they will stand this long and expensive shipment. However, once candled, it is stated that they are sold only about three cents below "Firsts" in New York City. Practically all are bought by hotels and bakeries.



THE LEAGUE OF NATIONS

The constitution or, rather, "covenant," of the League of Nations has been approved by the members of the congress. The articles of the covenant specifically refer to the Monroe Doctrine with, "Nothing in this covenant shall be deemed to affect the validity of international engagements like the Monroe Doctrine for securing the maintenance of peace." This covenant is not entirely acceptable to any one of the nations, yet has been accepted by all who are participating in the congress as the best which may be secured at this time. It is now thought that with the amendments it will be ratified by the senate of the United States.

CROP REPORT

It appears that California will have one of its biggest and best fruit crops in years. More correctly, we should say the blossoms and present conditions promise this. There are still months of varying weather conditions to be considered. The fruit growers, however, are anticipating excellent prices, and presumably the best of care will be given to fortify the trees against any unfortunate weather or other conditions.

Cultivator letters have brought from almost every part of the state information as to present conditions. It will be noted that these show great diversity. Some exceptional sections show as low as 20 per cent of normal crop; others, 120, but altogether the promise is great. This, combined with marketing conditions which will probably prevail means great return to California fruit growers. We say "conditions which will prevail" for papers in many sections of the state chronicle contracts made at blossoming time for prices which should prove exceptionally satisfactory to the growers.

Gaining 6,300 Miles by Proper Inflation

LONG before they had delivered the mileages everyone expects from Goodyears, two tires on a heavy eight-cylinder car blew out. The car-owner, Mr. Ralph Booth, took them to a Goodyear Service Station near his office, on West 27th Street, New York. The Service Station Dealer examined them, asked Mr. Booth to what pressures they had been inflated, and then proved that according to the inflation charts the tires should have carried at least fifteen pounds more air. Mr. Booth wasn't quite convinced, but he put on two new Goodyears and kept them properly inflated. These tires have already given 6,300 MORE miles than the under-inflated ones and look good for as many more. Ask your Goodyear Service Station, or write to Akron, for Lesson 3 of the Goodyear Conservation Course—telling how to gain mileage by proper inflation.

UNDERINFLATION shortens by thousands of miles the life of the best of tires.

Without proper air support the tire walls have to bend and flex sharply and constantly.

The extreme bending and flexing of side-walls without sufficient air-support generates excessive heat at the flexing points.

This heat acts on the rubber in and between the plies, making it lifeless and brittle.

The plies separate on the shoulder of the tire, and from chafing against each other soon lose their strength.

Then the inner plies, which are most quickly affected, are fractured—the tube is pinched between the rough edges of the break, and a blow-out follows.

◇ ◇ ◇

IN certain cases, however, where the damage is not too great and the weakened fabric carcass has not actually broken, Goodyear Service Station Dealers find that by applying a Goodyear Reliner the tire can be made to deliver a thousand and more additional miles.

But consistent attention to proper inflation would save many thousands—at no expense whatever.

Find out just what pressures your tires should carry by asking your Goodyear Service Station—or by sending to Akron—for Lesson 3 of the Goodyear Conservation Course.

The Tractor Demonstration

IT would be quite impossible for one to visit Arden Acres, the 650 acre tract adjacent to Sacramento, where the second annual tractor demonstration will be held May 6-11, without becoming greatly impressed and enthused by the magnitude of the effort that is being put forth to make this demonstration excel anything of its kind ever pulled off in the West.

Tractors have not arrived singly. They have arrived by the carload and the mechanics have worked like Trojans putting them together and giving them a try-out. The two big tents are up and the special exhibits are being installed just as rapidly as possible. By next Tuesday, the opening day, everything will be in readiness and there will be no waiting, no delay.

R. M. O'Neill, the manager, has had a corps of men busily engaged for the past month, laying out the extensive auto parking space, building eating houses, rest rooms, etc., preparatory to receiving the biggest crowd that has ever attended a demonstration in this part of the country. And that crowd will include everybody who is interested in tractors that can possibly make a get away. John H. Davis, plow expert for the Holt Manufacturing Company, inspected the field and pronounced it

A further educational feature of t demonstration will be the working a fully equipped machine shop whe one may see the actual boring and grinding of cylinders, and general pair work such as may be requir A Sacramento machine shop is be moved in its entirety to the groun for this educational feature.

A special feature will be the wo ing of Stone's rotary grain clean which is a marvel of power and e ciency. Its main features are vibr ing wires operating without wind, quiring no adjustments, cleaning a separating all kinds of garden see beans and grains. The entire six n chines that will be in operation different grains at the same time w be run by a five horse power mot cleaning one and one-half tons hour. Great interest is being taken this machine, which is being sho for the first time, and visitors fr all parts of the country will make t trip to witness its working.

The preparation for this demonst tion has been done in a very thorou and satisfactory manner. Nothing h been left to chance and everythi will be completely installed and rea for work when the show opens Tuesday morning.

This demonstration has attract

Site of the California Tractor Show

Surroundings of the city of Sacramento. Plat outlined by black square, w right side map above, indicates location of tractor demonstration ground. Headqu ters in the city of Sacramento will be at the Land Hotel on K Street. From headqu ters two heavy black lines show two separate routes to the demonstration grounds

absolutely fit for both machines and spectators. All of the roads leading to the grounds have been put in perfect condition by the supervisors. The hotels of Sacramento are making preparations to handle the visitors to the best of their ability, but the Chamber of Commerce is supplementing the work by obtaining a list of available rooms in private houses. There will be ample accommodations and no one need fear that he will not be able to secure a good place to sleep. Near Arden Acres is McKinley Park, where excellent camping grounds may be had free. There will be no charge for admission to the grounds and the auto parking space will also be free, with free attendance to insure the safety of the machines.

The main tractor program will begin at ten in the morning and last till noon. During that time all of the tractors will be seen on the big open field plowing, harrowing, checking, pulling tractor implements, drawing scrapers and performing a few extra hair raising stunts not on the calendar. This will be a practical demonstration of the value of the tractor in farm work and will show the capabilities of the various styles and sizes of machines.

During the afternoon there will be private demonstrations with the various machines and lectures in the tents. These lectures will form a most important part of the week and will be by men amply qualified to present their subjects in the most comprehensive manner. Professor H. P. Davidson of the University of California will talk on the special features of the tractor and its proper care and handling. Mr. Paul Melcher will discuss the subject of proper lubrication and Dr. Cocanneur will talk on soils and the better methods of farming.

almost world wide attention. T grams have been received from Netherlands, the Dutch East Ind and China. Consuls from these many other countries will attend, will also the chambers of comme from all the Coast cities, boards supervisors and other interested b ies.

The big tents will be crowded w all kinds of accessories, includ magnetos, carburetors, plows, b rows, oils, patent devices of all kin together with a complete line of m ern trucks.

There will be more than 50 dif ent types of tractors in operation a the demonstration can not fail arouse keen interest in more and b ter farming. As an educational f ture it will surpass anything of kind ever held on the Coast. Th who are fortunate enough to be a to attend will be more than paid the time and money spent, for it only at a demonstration that one c secure an impartial judgment u the fitness of any tractor to do on required work.

Special rates are being made on electric lines. Ample auto facilit are being provided for the transp tation of visitors from the city to grounds. The round trip will be cents. The roads are good and w be kept free from dust during the tire demonstration. Every possible fort has been made to insure the c fort of the visitors.

The California Tractor & Imp ment Association is conducting demonstration. Officers: W. H. Ga ner, Marysville, president; C. E. W erell, Stockton, vice-president; G. Walker, Stockton, secretary-treasu Active members of the associat are: Advance-Rumely Thresher C pany, Averill Machinery Compa

NATIONAL QUARANTINE

The department of agriculture announces the effective date of the quarantine as June 1, 1919. This quarantine will mark the operation of new and strict regulations governing the importation into the United States of plants and plant products. The quarantine order has been promulgated by the secretary of agriculture to check so far as possible the introduction of more dangerous crop enemies. Experts of the department of agriculture estimate that the losses caused by the pests already introduced, for the most part through the agency of imported plants, aggregate half a billion dollars annually.

Important provisions of the new quarantine are as follows:

Requires permits and compliance with regulations for importation of lily bulbs, lily of the valley, narcissus, hyacinths, tulips, and crocus; stocks, cuttings, scions, and buds of fruits for propagation; rose stocks for propagation, including Manetti, Multiflora, Brier Rose, and Rosa Rugosa; nuts, including palm seeds, for propagation; seeds of fruit, forest, ornamental and shade trees, seeds of deciduous and evergreen ornamental shrubs, and seeds of hardy perennial plants.

Leaves unrestricted, except in special cases, importations of fruits, vegetables, cereals, and other plant products imported for medicinal, food or manufacturing purposes; and field, vegetable, and flower seeds.

Excludes all other classes of plants for propagation, including fruit trees, grapevines, bush fruits, grafted and budded roses, forest, ornamental and deciduous trees, ornamental and deciduous shrubs, pine trees of all kinds, broad leaved evergreens (such as azaleas and rhododendrons), and a long list of plant material commonly known as florists' stock.

Excluded plants may still be imported through the agency of the department of agriculture in limited quantities to supply the country with novelties and necessary propagating stock, such entry being safeguarded by the highly developed inspection and quarantine service which has been organized by the department.

Quarantine No. 37 represents years of careful consideration given to the subject by the experts of the department of agriculture and of the several states and of the interests concerned, followed by a public hearing, and subsequent further investigation and consultation with the principal nurserymen and florists of this country. The quarantine, therefore, embodies the best judgment of the plant experts of the department, and of the several states, concurred in by most of the interests engaged in actual plant production. It voices the belief that the policy of practical exclusion of all stock not absolutely essential to the horticultural, floricultural and forestry needs of the United States is the only one that will give adequate protection against additional introductions of dangerous plant diseases and insects.

The Eldorado farm bureau has a grazing association as one branch of its activities. Members have been conferring with the forest supervisor with a view to cooperation in the coming grazing season

Care and Operation of Tractors

By W. H. Gardner

THE successful outcome of an investment in anything that has to work depends upon the four following factors: Construction of machine both from a standpoint of parts and of the machine as a whole; adaptability of machine to perform tasks required of it; method of operation; care taken of the machine.

The first of these points must be very carefully considered at the time the machine is purchased. The farmer who is in the market for a traction engine should avail himself of all the information that it is possible for him to obtain. He should visit farms that are using tractors, talk to the owners, write manufacturers for catalogues and descriptions of their product. He should read in the different journals all that he can find relative to the virtues of the tractor in general in the field and on the farm. In other words he should study the tractor proposition most thoroughly, looking at the question from all the possible points of view before finally signing a contract of sale.

Of course, it is not possible for one to become thoroughly acquainted with any article purely from what information is at hand, but he can get a good survey that will enable him to decide which type is the better for his particular set of conditions and which will fit his pocketbook the best.

Do not stop at this general and superficial study, but if possible visit the factory or at least one of the dealers where a machine can be examined. Look at the material used, look at the general workmanship, examine the appearance of the machine from a short distance. Is it neat in appearance? Is the general appearance pleasing? Has the designer tried to conserve space? Are the proportions consistent? Is the weight well distributed? Is a good quality of paint used in finishing? Is the paint daubed on or is it skillfully placed? It must not be construed that the outward appearance has anything to do with the operation of the machine, but just the same slovenliness in any one part of the machine is very likely to be reflected many places where it is not easily seen. If a cheap grade of paint is used it is not unreasonable to suspect that a cheap grade of steel is also used or that the oil in the crank case is cheap and poor, etc. If the general appearance is not pleasing it means that the space has not been properly conserved, and this poor proportioning may well extend to the gears in the transmission case or to the bearings in the crank case.

Then, before making your purchase, sit down with paper and pencil, tabulate the different duties that you are going to expect the tractor to perform. For example:

Forty acres to be plowed, double disked, drilled to grain and harvested each year on your own home place.

One hundred acres of plowing to be done on contract for neighboring farmers, most of which will be summer fallow.

Two weeks hauling by contract from the field to granaries.

Ten cords of wood to be sawed per year, etc.

Submit your figures to the manufacturers who have experts that can tell you what size and model of their tractor should be used, price, date of delivery, etc. Don't try to make a trac-

Ditching-Draining Grading

Farmers who want to make money and save labor write for our illustrated folder on Austin Farm Ditcher.

California Cultivator
Costs Only $1.00 Yearly

See the Famous Forkner Cultivator

in action at the Tractor and Implement Demonstration Sacramento, May 6-11, 1919

The remarkable results secured by this cultivator in California are the talk of the entire state.

In preparing seed beds for crops of grain grown under the soil bacteria system or for seed beds in general, it is unequalled, the spring tension teeth cultivating the soil to an even depth and leaving the coarse soil on top and the fine dirt in the root bed. In killing and removing Johnson Grass, Bermuda, tule roots and other pest growths, it is a source of constant wonder. In cultivating alfalfa, orchards and vineyards, it is ideal. In summer fallow work, it makes a perfect mulch and leaves the soil in exactly the proper condition for absorbing rainfall.

It is made unusually strong for tractor work, at the same time being of unusually light draft with a greater cultivating capacity than any other similar implement. A 75 H. P. Tractor will easily pull 45 feet.

It comes in a size and style for every purpose and to meet all conditions of all kinds of soil.

See it at the Demonstration. It will prove a big money-maker for you. Descriptive catalogue sent on request.

A Full Line of P. & O. Tractor Plows, Harrows, etc., Will Also Be Demonstrated

Baker, Hamilton & Pacific Co.

San Francisco, Cal.

Distributors for Superior California.

tor that is suited to a ten acre farm handle 100 acres. Don't try to drive a pump that requires 30 horse power with a tractor that has a belt horse power of 15. Don't get a machine that will not go under your trees nor that will not turn around at the end of the furrow. Don't get a tractor that travels too fast to do good work, nor yet one that will not have at least one good traveling speed when it is necessary to go any distance light.

W. H. Gardner

Assuming now that you have made your purchase and that the tractor is on the place ready to go to work: Remember that you have a piece of machinery representing a pretty fair investment and a servant that you are going to learn to lean on more and more as time goes on, one that has no come back when ill treated other than to refuse to properly perform its functions. Don't lose sight of the old adage, "A stitch in time saves nine," and above all remember that a machine has no power within itself to remedy wear or strain. Don't leave a squeak nor a knock to take care of itself, because it will not do it.

A man that operates any kind of a machine should feel for that machine a sort of pain every time it shows signs of weakness. He should instinctively feel refusals to work, and every quiver of its frame, every noise of its moving parts, every movement of its gears, wheels, or shafting should mean to him that it is either normal or not. The exhaust of the motor, the ease with which it takes its load, its response to sudden loads and grades, its knocks, it grindings, its heating, in fact its every peculiarity must be known to the operator if he is to get all the work out of it that he should. The natural noise made by the machine should be music in his ear just as the noises made by children are music to the ears of their parents, and just as a whine on the part of the child, or perhaps a sneeze, will inject discord into the music of natural joyful play, so should a slight squeak or knock inject discord into the music of the tractor's noise.

There is only one way for the operator to acquire the faculty of knowing these irregularities or discords, and that is through the avenue of study. Study your tractor; know its every part; study the catalogs furnished you; study the instructions and then study the tractor under actual operation. In other words, know your tractor; know its construction; know its materials; know its possibilities; know its requirements; know its peculiarities; and then get acquainted with your engineer.

If you are not going to operate the machine yourself, know the man that is going to, and know that he knows the machine. The more that you know and the more that he knows the better you will be off. Don't turn over such a faithful servant as a traction engine to a man that you would not trust with your finest horse or automobile. Take this man over the tractor; be sure that he knows what should be expected of it, where it can go, how fast it is supposed to travel, and then impress upon him the importance of not overloading, easing onto your load, never jerking, and taking care of breaks and indications of breaks right now.

The following are a few don'ts.

Don't overload.

Don't run too fast.

Don't adjust your implement to the easiest part of the field and then expect the tractor to handle it when the tough spots are encountered.

Don't jerk, nor buck your load.

Don't add patent ingredients to the oils or greases unadvisedly.

Don't try to stop leaks in the water circulating system by the use of dopes in the water. "Whatever will stop a leak will stop a flue" holds here just about as well as it does with steam boilers.

Don't try to economize by using cheap grades of oils. You will find that oil is cheaper than steel any time.

When you have found an oil that is satisfactory stay with it unless it can be definitely shown that another is superior, that is, it will allow the engine to run with less effort and with less wear, but don't change "because it is cheaper".

Don't tinker with the magneto, carburetor, nor any of the delicate parts. If they don't work properly, either get an expert on the job or else go at the trouble scientifically.

Don't neglect evident repairs, though they may seem trivial.

Don't let knocks in the crank case go without investigation.

Don't work with poor tools. Get a set of good substantial tools fitted particularly to the tractor and machinery used.

Don't neglect the tools. Keep them in a good safe place where they can be gotten hold of simply and keep them in good shape so that when you do want to use them they will do the work required of them to the very best efficiency and with the least possible loss of time.

Don't fail to keep the crank case properly filled with lubricating oil.

Don't fail to provide a shelter for the tractor. It will pay you.

Don't be in too big a hurry to call the factory for help. Learn to be as independent as you can as soon as you can.

TRACTOR DEMONSTRATION NOTES

Moline-Universal Tractor

"Every Moline must give satisfactory service," is the demand of the makers. There are 23 Moline factory branches in the United States, and every one is founded on a system of "service." "If any Moline-Universal is not giving satisfactory service, we wish to know immediately."

Avery Tractor

The Avery is made in eight sizes, and the Avery people are spending thousands in demonstrating the power of these machines and their ability to produce more cheaply. Bartholomew and Poss will both be there.

Indiana Tractor

The Indiana tractor made by the Indiana Tractor Company of Anderson Indiana, well known for silo building is represented in California by the Indiana Tractor Company of California Los Angeles. This tractor is the two wheel type and weighs only 175 pounds. The operator handles both tractor and implements from seat.

The Yuba Ball Tread Tractor

"The Yuba is as free from wear and trouble as human ingenuity can today devise." "Let oil and distillate raise your crops" is a suggestion which will be made by the Yuba Manufacturing people to thousands who will see their dependable tractor work.

The Caterpillar

"Caterpillar" hardly carries the idea of enormous power until one has seen the "45" or "75" pulling a great gang of plows across the field. The Holt people motorized artillery to help win the war; they are motorizing plows and all kinds of soil preparing implements and making more effective farming operations.

The "Little Bear" Tractor

The busy little dirt disturber bearing the California emblem is a California product built especially for orchard work and general California conditions. It has demonstrated its ability satisfactorily in conditions that confront all tractors. Manufactured by Los Angeles Auto Tractor Company, Los Angeles.

Cleveland Tractor

One of the interesting and instructive features of the demonstration and one that has always attracted buying spectators at all former demonstrations, will be the performance of the Cleveland Tractor pulling all sorts of farm implements without straining the sturdy little tracklayer. Smith Bros. of Los Angeles are distributors.

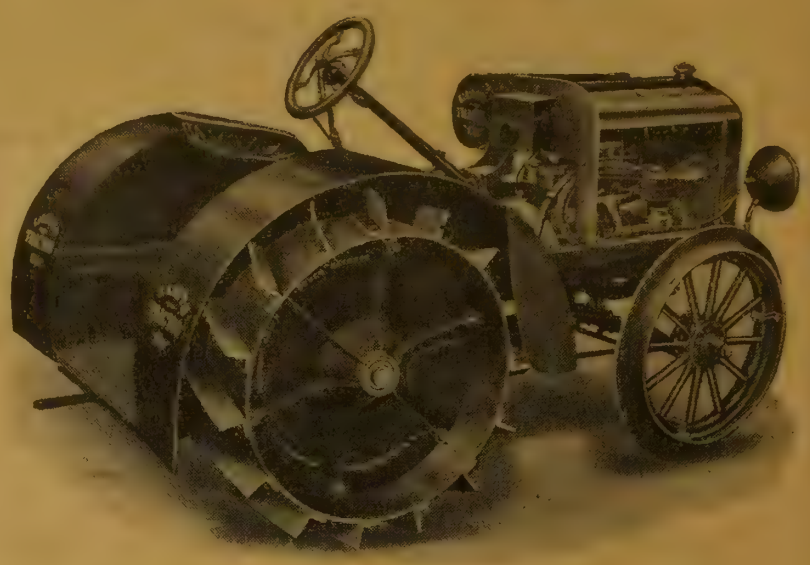
Heavy Tractor Implements

The Killefer Company of Los Angeles will display a line of heavy duty

The "LITTLE BEAR" TRACTOR

Specially Adapted to Orchard Work

Built in Los Angeles



THE "LITTLE BEAR"

Four Horse at the Draw Bar, Forty-four (44) Inch Track, Fifty (50) Inches High, over all. Turns in a Ten (10) Foot Radius. Weighs only 1600 Pounds.

All Gears enclosed and kept dust-proof by a new device used on no other Tractor.

Roller Pinion: The Spool is cut and machined from steel bar—the rollers and pins hardened.

Dust Filter is furnished to clean the air entering the carburetor, keeping the cylinders and pistons free from grit and dust.

THE "LITTLE BEAR"

Fenders are provided to protect low lying limbs and fruit in the orchard. A wide platform and special hitch with swinging draw-bar for close-up work around trees.

Ford Motor and Ford Transmission used, which means you can get FORD parts for repairs. Time and money saved by this feature alone. FORD parts are cheap in price, high in quality and obtainable anywhere and everywhere.

Perfected Cooling System.

Special Radiator.

READ WHAT THE FRUIT GROWERS SUPPLY CO. SAY ABOUT THE "LITTLE BEAR":

Office of Secretary.

To All Exchanges, Associations, and Special Contract Shippers, Members of the Fruit Growers Supply Co., Los Angeles, Cal., April 1st, 1919.

Gentlemen: We have just entered into an arrangement with the L. A. Auto Tractor Co., who are manufacturers of the "Little Bear" Tractor.

We believe that the "Little Bear" is one of the best little tractors of its type on the market at this time, especially adapted for orchard work. If any of your members should be interested in this tractor, we will be pleased to have them make inquiry as to price and demonstration and further information that may be desired; or same can be secured direct from the L. A. Auto Tractor Co., at 52nd and Santa Fe Ave., this city.

Yours Very Truly,
FRUIT GROWERS SUPPLY CO.,
By E. P. Jochimsen.

L. A. AUTO TRACTOR COMPANY, INC.

52nd Street and Santa Fe Ave., Los Angeles, Cal. **Telephone 29347**

implements at the demonstration with a generous corps of service men. Among these are subsoilers and chisels built for the big 75's to handle.

Oliver

"Oliver"—and you think of plows. Oliver plows have been used at every demonstration where dependable implements were desired to test out the power of tractors. The Oliver will be at Sacramento.

Waterloo Boy Tractors

The John Deere Plow Company will not only have a full line of John Deere plows, but in Tent No. 11 on Demonstration Field will give information and arrange to demonstrate with Waterloo Boy Tractors.

Tractor Implements

The L. M. Davenport Company of Los Angeles, which has for many years manufactured a line of deep tillage tools, tractor implements made especially for California conditions, hay balers and hay tools, has been sold to E. N. Warr, former manager, and R. M. Davenport, son of L. M. Davenport. The new firm will be known as the Davenport Implement Company.

Menominee Truck

Tractors produce cheaper; trucks aid in marketing cheaper. The Menominee Truck has high recommendations for efficiency and dependability.

La Crosse Tractor

The La Crosse will be at the demonstration under the management of the California Tractor and Implement Company of Sacramento. It is also handled by Knapp Tractor and Machinery Company, Los Angeles.

Russell Tractor

The A. H. Averill Machinery Company of San Jose will come across with two sizes of tractors and Russell machinery.

Knapp Tractor Disk Plows

A real power lift—just a slight pull at the rope and up comes the plow. A good tractor deserves a good plow. See it operate.

Bacteria

Western Soil Bacteria may not have great draw-bar pull but it sure has pull with leguminous plants. The Westrobac people will be there with abundance of proof of this particular pull. They will not only display living plants of the legumes but ask visitors to observe wheat, barley, oats, etc.

Forkner Cultivators

The Baker, Hamilton and Pacific Company will give some thorough tests of the Forkner Cultivator. It is a magnificent implement for preparation of seed bed for grain or other field crops. The same people will also show full line P. & O. tractor plows and harrows.

The International Tractor

The International people will be at the demonstration with the 8-16 and other sizes. "A size to meet practically all requirements."

Bean TrackPULL

"Watch the Bean." Superfluous advice entirely, for we have seen at these demonstrations, intelligent inquirers watching and asking all kinds of questions as to the Bean.

Allwork Tractor

The Electric Wheel Company of Los Angeles is coming up with a powerful four-cylinder, a kerosene tractor, furnished to pull four plows.

Fageol Tractor

The Fageol people call their tractor the "walking tractor." It has 64 walking legs which secure its traction and at the same time aid in loosening soil. The Butler-Veitch people will walk it around.

Bates Steel Mule

One of the favorite orchard crawler type tractors, the Bates Steel Mule Model D, will again demonstrate to the interested throngs the power and efficiency that can be wrapped up in a compact frame of steel. This exhibit will be under the direction of the J. M. Conley Company, northern distributors, Stockton. F. T. Briles, Los Angeles, is southern distributor.

Show Me Facts!

BEFORE you buy *any* tractor you have every right to say to the manufacturer: "Show me what the USERS of your tractor have to say. *Show me* that it has already proved itself economical and practical in everyday work. *Show me* the *figures* your *users* have given you so that I may figure costs and so determine why I should own one of your tractors."

Here, then, is part of one of the large number of letters constantly received from farmers telling us what their *Cleveland Tractors* do for them.

To begin with, I used my Cleveland Tractor to plow about 305 acres during 1918 and used double discs, two 60 tooth harrows and a heavy wooden drag on one load for fitting.

When I plowed I covered from eight to ten acres a day with a two-bottom gang and covered about 40 acres a day with the harrows.

I harvested 150 acres of wheat and oats at 25 acres per day.

In July I used the Cleveland in loading hay, and got in the crop from 140 acres at the rate of about 35 tons a day.

Besides these things, I used my Cleveland for a great many belt jobs—put in 300 tons of ensilage in 32 hours, on 30 gallons of kerosene, for instance.

I now keep six horses, instead of the fourteen I had before and need two men less than previously.

My Cleveland is in excellent condition, ready for the 1919 season, and counting everything, I haven't spent over $10 for repairs.

F. H. JOHNSON,
New Augusta, Indiana.

Such specific, definite facts tell why the Cleveland is so fully justifying the faith that so many farmers have placed in this compact, powerful Tractor. Write *today* for complete infoumation and the name of your nearest Cleveland dealer.

The Cleveland Tractor Co.

19077 Euclid Ave. Cleveland, Ohio

The largest producers of track-laying tractors in the world

"The Cleveland is the ideal tractor for California conditions—see it in action at the Sacramento Demonstration."

Cleveland Tractor

Mr. C. E. Everett of North Cambridge St., Orange, Calif., writes under date of March 17th, 1919:

"My Cleveland Tractor, bought in June, 1918, has given me every satisfaction. In my opinion it is the only tractor on the market suitable for orchard work, being easily handled, gets closer to the trees, without injury, than with horses. So far my upkeep expense is negligible, while the cost of operation is surprisingly low."

Power A Plenty

For All Kinds of Field and Belt Work

THE powerful 4-cylinder motor (5-in. bore and 6-in. stroke) built into the *Allwork* Kerosene Tractor is really the type of engine usually furnished to pull *4* plows. We simply claim that the *Allwork* will pull *3* plows through any kind or condition of soil. This means a sure surplus of power for all field and belt work at all times.

The *Allwork* is an all-the-year tractor, equally useful and economical Spring, Summer, Autumn and Winter. Absolutely

Guaranteed to Burn Kerosene Successfully

See the letter from an owner of an *Allwork* in panel at left. Then—*Write for 1919 Catalog.* Sent free for your name and address.

Wonderful Performance

"We plowed from 9 to 10 acres a day with our *Allwork*, burning only 20 gallons of kerosene. The best plowing engine we ever saw. After plowing 150 acres, harrowing, grinding, running ensilage cutter, etc., we inspected the gears and crank bearings and the wear could not be noticed at all."

Deliver your water where you want it.

Give the the Tractor a Chance

By C. E. Skidmore

IT SEEMS to the writer that farm tractor distributors and dealers should make a greater effort to impress upon the purchaser of a tractor the necessity of giving his machine proper care and attention and of not overloading it.

Practically all manufacturers send out a well written book of instructions with each machine, and it is comparatively easy to learn about repairs, but the majority of instruction books give little or no space to the subject of avoiding repairs. It is obvious that how to avoid the necessity of repairs is a topic of more importance to the farmer than how to make repairs. This subject, however, is a topic the tractor man, be he manufacturer, distributor or dealer, hesitates to dwell upon because he fears what he may say in cautioning the owner will be understood as lack of faith in the machine he sells.

It is plain that salesmen cannot be expected to do this educational work with the purchaser. Salesmen are optimists or they do not long remain in that occupation. Commodities are not sold by under-statements. The buyer always wants the most he can get for his money and the salesman

Chas. E. Skidmore

always promises it to him. A large measure of enthusiasm for the article sold is necessary in order to create a desire, and often extravagant promises and unduly strong statements are made in order to get the signature on the dotted line. This is only natural and the salesman should not be blamed for his enthusiasm. He has learned that it is necessary to be enthusiastic in order to make sales, and his business is to sell.

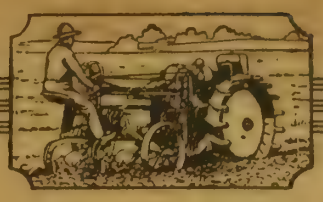
But after the sale has been made, the transaction closed, and the bright and shiny tractor is being delivered to the purchaser, someone should have a "heart to heart" talk with him, and impress certain facts indelibly upon his mind. Probably the dealer's service man would be the logical one, but the matter might be covered satisfactorily in a letter from the dealer, or a talk by the service man and a letter might both be used. The writer would suggest a talk or letter along the following lines:

The average farmer has learned by experience that he must take proper care of his automobile or suffer the consequence of large repair bills and abnormal depreciation. If he is starting out on a 200 mile trip he first looks the machine over very carefully and sees that all parts are properly lubricated and adjusted, and on the return from such a drive he goes over it again. At the same time few farmers seem to realize that a farm tractor needs the same care as an automobile. They are inclined to "run her as long as she will keep going," without thought or care, and then when the abused piece of machinery, screaming for oil and knocking for attention, finally refuses to go, they say it is "no account" and that the dealer has "buncoed" them and they are sore if he refuses free service to repair the damage.

No farmer would expect to get work out of his horses or mules if he failed to provide proper shelter, care and feed for them. They must be stabled, bedded, curried, watered and fed daily and even then they are subject to sickness and require exercise to keep them in condition. Proportionate to the work they perform, tractors require much less attention than either horses or automobiles.

An automobile uses on an average about ten per cent of its power; it has only to propel itself. On the other hand a tractor uses on the average 90 per cent of its power; it has not only to propel itself, but also must do its heavy work.

The average automobile motor is geared at a ratio of four to one in high, which is the speed at which it performs its work. The average tractor is geared at a ratio of 70 to one at working speed of two and one-third miles per hour. The work performed by an automobile motor during one hour's driving at 25 miles per hour may properly be expressed by the equation 4 x 25, 100. At a speed of 40 miles per hour, the equation would be 4 x 40, 160. The work performed by a tractor motor during one hour's plowing may properly be represented by the equation 70 x 2 1-3, 163.3. In other words, the work done by a tractor motor at plowing speed is more than that done by an automobile motor in driving an auto 40 miles per hour, because the auto has only to propel itself.



No sane man would run an automobile 40 miles per hour, ten hours per day, without its being gone over daily by expert mechanics. Fortunately tractors are built along huskier lines and will stand abuse that would quickly ruin an auto, but they will not stand lack of grease, oil and necessary adjustments. Often ten minutes' work done in time will save a two hour repair. If you fail to give the proper attention and have to pay the consequences in repair and service expense, do not blame the tractor.

With each tractor a carefully written instruction book is furnished, containing plain directions and easily understood diagrams so that any bright 16 year old boy can in a few hours learn to care for the machine, and if there is anything he does not understand, the dealer will be glad to have his service man explain and give expert advice. If there is any fault or defect of the tractor, the dealer will gladly help you and the manufacturers are bound under their guaranty. But do not expect or ask your dealer to give free service to repair damage that is a result of your own carelessness or failure to follow directions.

Remember that tightening a bearing or grinding a valve when it needs it will keep the tractor on the job when you need it.

And there are some things which it is extremely important not to do. California farmers have a deplorable habit of leaving farm machinery out in the field in all sorts of weather. Machinery will not stand such abuse—it will rust out faster than it wears out, unless it is protected from the elements. Treat your tractor as kindly as you did your horses.

We know of one owner of a 12-20 tractor in the San Joaquin Valley who has been pulling a Stockton gang plow of eight ten inch bottoms for several months and has had no trouble—but he will have. The 12-20 model is designed to pull three 14 inch bottoms on ordinary soil conditions. Anything more is an overload. It is true the machine will pull more, but only at the expense of excessive wear, just as a man can stand up under 16 hours work per day for a while, but no one can keep it up for long, and everyone admits that it does not pay. You may pull an overload for a season or two and "get by", but your machine will not last as long and you will have more trouble with it. The additional work accomplished by overloading is slight and not worth the cost. The United States department of agriculture Bulletin No. 719 says: "Three plows behind a two plow tractor will cover only a little more ground as a rule than will the two plows, because the tractor will travel a little slower, partly because the motor is overloaded and partly because

Every Moline-Universal Tractor Must Give Satisfactory Service

When you buy a Moline-Universal Tractor the transaction does not end there. In addition you buy Moline Service—which is service that satisfies. This means that with intelligent operation you will be able to keep your tractor working to full capacity during its entire life.

Moline Service means exactly what it says—and we have perfected an organization which enables us to furnish Moline Service that satisfies. We can do this because:

1. Twenty-three Moline factory branches in all parts of the United States carry stocks of repairs and complete machines—in charge of an expert service department.

2. Factory branch territories are sub-divided into service territories each in charge of a resident Moline Service Supervisor—whose sole duty is to see that Moline Service is properly and promptly furnished in his territory.

3. Every Moline Tractor Dealer is required to carry Moline-Universal Tractor repairs in stock and have a competent service department to provide prompt and efficient service.

4. Tractor schools of short duration in charge of expert instructors are being held in co-operation with Moline Tractor Dealers, to instruct farmers in the care and operation of Moline-Universal Tractors. These schools will continue to be held as long as there is a demand for them.

5. With every Moline-Universal Tractor we furnish a complete instruction book, giving full information on care and operation of the tractor.

6. Moline-Universal Tractors are simple in construction, have the best materials and workmanship money can buy, and all working parts are quickly accessible.

Therefore we are prepared to back Moline Service to the limit and you are sure of getting constant and satisfactory work from your Moline-Universal Tractor.

If any Moline-Universal Tractor is not giving its owner satisfactory service we want to know about it *immediately*.

The Moline Plow Company leads the Tractor industry—first, in developing and perfecting the original two-wheel, one-man tractor which does *all farm work including cultivating*, and again in announcing a service plan which makes a "booster" of every Moline Tractor owner.

Join the throng of "Moline Boosters." You will be able to do twice the farm work at half the expense. See your Moline Dealer now or write us for full information.

Moline Plow Company, Moline, Illinois

Service That Satisfies

Mr. Farmer

If you grow Raisins, Prunes, Peaches, Pears, Apples, Apricots, Grapes, you need a

SAHARA DRIER:

Every year your losses run into thousands of dollars because of adverse weather conditions—over-ripe fruits, etc. The Sahara Drier guarantees you against such losses. It is the cheapest and best possible insurance for your crops. You cannot afford to take a chance on early rains such as came last Fall.

WINE GRAPES—Many of the California growers are making ready to dry their 1919 crop. We guarantee our machine to do satisfactory work. Our patented process makes this possible. Prices are $650 and $850 for our one-ton-per-day Drier. See our representatives for particulars:

Cameron & McDonald, Chico.
Clark & Croswaite, San Jose.
C. F. Moon & Co., Fresno.
A. L. Bowman, Lodi.
Chas. F. Wyer, Napa.

California Dried Products Co.,
Home Office 149 California St.,
San Francisco - California.

The Threshing Problem Solved

Threshes cowpeas and soy beans from the mown vines, wheat, oats, rye and barley. A perfect combination machine. Nothing like it.

"The machine I have been looking for for 20 years," W. F. Massey. "It will meet every demand," H. A. Morgan, Director Tenn. Exp. Station. Booklet 26 free.

Koger Pea & Bean Thresher Co.,
MORRISTOWN, TENN.

EARN BIG MONEY

In the auto and tractor business, $100 to $300 a month. Learn in few weeks by our system of practical instruction. All modern equipment. Expert instructors. Free $50 tractor scholarship offer now open. Earn board and room while learning. Write for free catalogue. Shows students at work, tells how YOU can make a big success in this business. NATIONAL AUTOMOTIVE SCHOOL, 802 South Figueroa, Los Angeles, Cal.

Farmers at Pullman have raised wages of farm labor to $3.00 per day, an increase of 50 cents.

the drive wheels will slip more."

The low speed is designed for emergency use only and the tractor should not be loaded to a point where it cannot pull the load ordinarily without having to go into low.

The farmer should be informed of the draw-bar pull of the tractor in pounds at the various speeds and can then calculate with some degree of accuracy the pull required in plowing different soils by applying the following rule and table:

Rule: To ascertain the draft of plows, multiply the cross section of furrow in square inches by the resistance per square inch of soil displaced, in pounds.

Average Resistance of Soils

Sand, 2 to 3 pounds per square inch.

Silt loam 3 to 4 pounds per square inch.

Light clay, 6 pounds per square inch.

Medium heavy clay, 8 pounds per square inch.

Virgin prairie, 15 pounds per square inch.

Dry gumbo, 20 pounds per square inch.

Dry adobe, 25 pounds per square inch.

Example: Draft of one 14 inch plow 7 inches deep, silt loam, 7 inches by 14 inches by 4 pounds—392 pounds.

It is just as important to not overload when doing other work as when plowing. The following tables will assist the farmer in learning the proper load. Similar lists for other sizes of tractors can be easily worked out by the dealer.

Three Plow Tractor Loading

Three 14 inch plow bottoms, average conditions of soil.

One 8 foot tandem disk harrow.

One 9 foot tandem disk harrow plus one 10 foot spike tooth harrow.

One 8 foot disk plus one 7 foot drill plus one 10 foot peg tooth harrow.

One 8 foot grain binder plus one 6 foot grain binder.

Two 8 foot mowers.

Two 6 foot hay loaders.

One 14 foot push binder.

One 14 foot header.

Two 12 foot drills.

Two 8 foot cultipackers.

Five Plow Tractor Loading

Five 14 inch plows—average conditions.

One 9 foot cut harvester thresher.

Two 8 foot grain binders plus one 6 foot grain binder.

Two 10 foot tandem disk harrows.

Two 8 foot tandem disk harrows plus one 30 foot peg tooth harrow.

Three 10 foot drills.

Two 10 foot drills plus one 25 foot peg tooth harrow.

There is an old saying about the inadvisability of "biting the hand that feeds you". The farmer will learn, either from his dealer or by costly experience, that it does not pay to abuse the tractor that feeds him. It is far better for all concerned that he obtain this information through the dealer from whom he purchases. In fact it is the dealer's duty to fully instruct him, and the sooner we recognize this fact and act upon it, forgetting our fear that our remarks may be misunderstood, the sooner will a lar measure of tractor trouble be elim nated.

That the tractor has proved a su cess and a paying investment eve under the abuse given it the last fe years, serves to show how indispens ble it will be to the farmer whe more intelligently understood a used.

Tractor in the Making

By S. R. Coffee

S. R. Coffee

The farm tractor was pioneered by manufacturers and farmers on the Pacific Coast. This new era for the production of crops was inaugurated about two generations ago when the grain growers of the expansive California valleys and fertile hill country of the Northwest found themselves unable to cope with the harvesting problem. To handle this great acreage, unlimited horse power was required for the purpose of hauling combined harvesters which transferred the grain in the head to the sack in one operation.

It was the necessity for power to pull these harvesters that prompted manufacturers to experiment with traction engines which would pull these harvesters more hours a day, faster and more economically than horses. The result was the steam tractor which the grain barons welcomed, realizing in it a factor for increased profits.

These old leviathans of the grain fields were manufactured by the hundreds, and not only were they practical for pulling harvesters, but equally satisfactory when the ground was in good condition for the pulling of plows, harrows and other land working machinery. In fact many vast ranches were placed in a position to dispose of numbers of their horses by the old steam tractor which did their work the power farming way.

These old outfits were the real ancestors of the gas tractors of today. Like the steamers, these first gas tractors were crude in design when compared with the tractor of present day manufacture. Air cleaners were unknown in those days; housing gears was considered impossible; in fact virtually every working part of the machine was left to fight out its own existence with the dirt and dust. On account of the construction the ma ter of lubrication was a questio with the result that many bearin went the way of junk.

Today gas tractors are so designe that nearly every working part is pr tected against dirt and dust. Fro the lubrication standpoint virtually e ery bearing is automatically oiled, a it is interesting to note that the pla bearings are gradually giving way the anti-friction roller bearings. Tra tors are now manufactured in whic there are as high as 37 anti-frictio bearings. This is particularly inte esting when it is considered that bea ings of this type were installed onl two or three years ago. They ar taking the place of the old type ba bitt bearing.

With the evolution of the tracto there has been an ever increasing i terest on the part of the farmer. Tra tors are now at work throughout th United States and nearly every othe country on the globe. They hav proved a great factor in promotin power farming.

California can truly take satisfa tion when it is considered that th state is the cradle of the tractor in dustry. California today possesse some of the foremost tractor manufa turing concerns in the country. Th product of many of these concerns used throughout the world.

A teacher was telling her class ti tile stories in natural history, and sh asked if anyone could tell her what groundhog was. Up went a litt hand waving frantically.

"Well, Tommy, you may tell what a groundhog is."

"Please, ma'am, it's a sausage."—Ottawa (Illinois) Citizen.

A former railroad brakeman, no serving in France, was bringing in bunch of prisoners.

"What have you there?" inquire an officer whom he met back of th lines.

"Just a string of empties, sir!" wa his prompt reply.—Frank G. Davis Cartoons Magazine.

Buying a Tractor?

Get Acquainted with the Indiana All-round Tractor

The INDIANA (made by the well known Indiana Silo Co.) is a light weight, single unit, two wheeler tractor, with direct, closeup hitch. Both tractor and implement can be operated by one man. It weighs no more than one large horse, yet does the work of four. It is just the right size and power to cultivate row crops, to plow, to drill, mow, rake, run an ensilage cutter, hay baler, small thresher or otherwise use as a power unit. There is no excess weight and no waste fuel. The implement is hitched as a part of the tractor and the operator rides the implement and drives the tractor. This is conceded to be the most correct and desirable hitch for a majority of farm operations. It requires less effort on the part of the operator and permits him to see implement and tractor operate all the time.

The Indiana Tractor

combines the greatest principles of efficiency and utility

It is The Lighest Powerful Tractor Sold in California

Your knowledge and experience with tractors and farm power is not complete without full detailed information about the INDIANA.

It is not only right in price, but in design, principle, material and workmanship—a correctness that we have not been able to materially improve in years, although constantly striving to achieve improvement.

Mechanically the Indiana Tractor is Perfect. All parts are as of high quality material as parts of the Highest Type Motor Cars.

When in operation the Tractor and Implement form one complete unit, backing, turning and going forward as one machine, yet being free to operate independently enough to conform to the surface of the ground.

In steering and operating a tractor from the seat the operator sees just what he is doing and can make adjustments if the work is not being done to suit him. This makes a large difference in how the work is done, the speed with which it is accomplished and the ease. Every stop is time and energy lost. Both are valuable.

If you are using horses consider this well:—It costs about $700 to feed four horses for a year and the Indiana will do their work on $250 spent for fuel and oil. No special hitches or equipment are required.

If you do not own a tractor, let us show you in figures that you can furnish yourself, and compute,—that the Indiana will save you money and make m o n e y for you, do more work than you are doing now and do it easier and in less time.

Whether or not you are ready now to buy, let us send you our printed material and you can be thinking it over. Fill in the blank below. We are here to give you information first and demonstrate what we claim. Extensive experiments under California conditions verify all our claims.

Some Good Territory Still Open

The Indiana serves nineteen of the twenty-one uses to which a tractor might be put on the ordinary California farm. NO OTHER TRACTOR serves such a high percentage of uses so economically and efficiently.

In buying the Indiana you do not have to buy new implements and new hitches, a point often considered too late. However, we recommend a heavier plow than for horses as the tractor will plow deeper.

The Indiana gives you practically 100 per cent of its total weight on the Tractor Wheels. It is the pull of the tractor that counts. The Indiana readily couples to all the top soil working implements, seeding, cultivating and harvesting implements already in use on the farm.

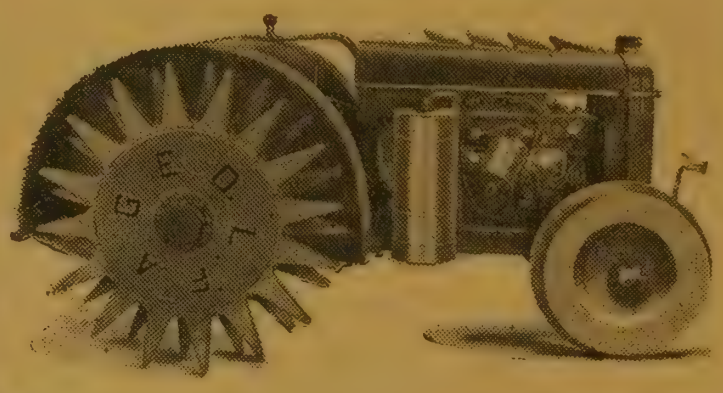
The Indiana's low fuel cost is due to proper engine design and to the fact that there are no dead wheels to push, or excess weight. Power is transmitted through one moving shaft on heavy duty ball bearings running in oil. All speeds are direct. All bearings are dust proof and all parts easily accessible. It delivers the maximum of tractor efficiency with a minimum of tractor weight.

It saves the wages of one man for the reason that it is possible to operate both tractor and implement from the implement seat. In cultivating cotton, corn, potatoes, beets and similar row crops the Indiana is especially desirable. Its light weight prevents packing; the tractor is up off the ground so that it easily goes over any crop that a cultivator will pass over and as the operator rides the cultivator, while driving, he can direct the cultivator shovels just where he wants them.

For cultivating groves the Indiana is small enough to go between narrow spaces and can be driven up close to trees and turned short. For belt work, such as running hay balers, ensilage cutters, saws, etc., it is entirely dependable and economical to operate.

Every guarantee is backed by one of the oldest, strongest manufacturing concerns in the United States. If you want an economically operating tractor the lightest weight, heavy duty tractor sold in California today, come and see the Indiana or write for printed matter.

FAGEOL
WALKING TRACTOR



THE Fageol Walking principle is new—yet the Fageol Walking Tractor is a development of more than five years continuous testing under field conditions.

The 64 walking legs of the light Fageol tractor secure traction as sure as do the eight legs of a team of horses.

Positive traction and a minimum number of moving parts make the operation cost of the Fageol Tractor unusually low.

Power of 6 to 9 horses, $1295.00 f. o. b. Oakland. The Fageol booklet contains information you should have.

Fruit Growers and Farmers to Discuss California Plant Industry

By Geo. H. Hecke

HORTICULTURAL Week in Riverside, May 26-31, is intimately associated with reconstructive work in the development of the plant industry of California. Many times during the past there have been big conventions of fruit growers, but never before has there been such a convention week as that now proposed for the last week in May, to be held under the auspices of the state commission of horticulture. Six conventions are planned, and their programs are being so arranged that there will be very little conflict between the various sessions for those visitors who are interested in more than one of these conventions.

At this time when all the world is talking about the League of Nations, it is very appropriate that California should take the lead in organizing a league of Western states for the protection of the orchards and farms of this state against the introduction of injurious insect pests and plant diseases. The states of the Pacific Coast are fortunately situated, in a measure, owing to the natural barriers formed by the ocean on the one side and the mountains and deserts on the other, preventing the intrusion by natural means of those pests which are causing such great losses in other countries and in other states. Owing to the presence of these natural barriers, the plant pests may be brought into the Western states only by means of some human agency. It is the purpose of this, the first Interstate Plant Quarantine Conference, to devise a policy of uniform quarantines whereby the Western states may gain the fullest possible advantage afforded by these natural barriers. Governor Stephens has invited the governors of all the Western states to send representatives to this conference. He also has invited British Columbia, Lower California, Mexico and the territory of Hawaii to be represented. The chairman of the federal horticultural board, C. L. Marlatt, has already signified his intention of attending this conference, and he will tell of the quarantine work done by the federal horticultural board and advise with the delegates from the Western states in framing their policies.

The Fifty-first Fruit Growers and Farmers' Convention will be attended by these representatives of other states who will be particularly interested in hearing the discussions on matters of local interest by California fruit growers. Every cooperative marketing association in the state will be represented at this convention and a brief talk on their activities will be made by each representative.

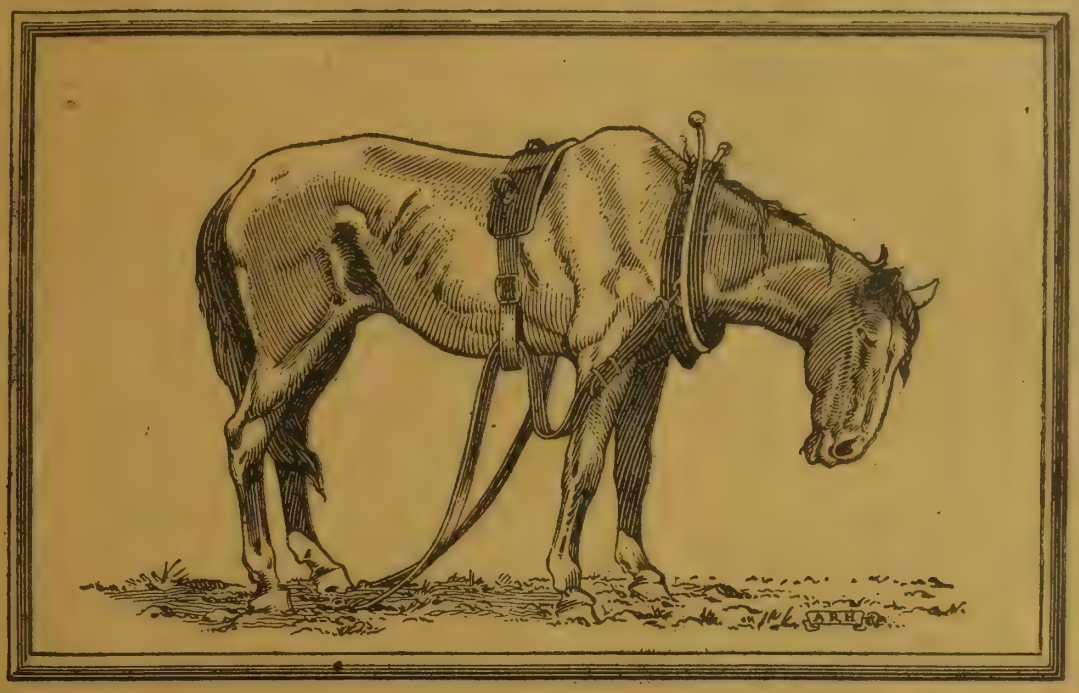
For the first time in the history of the organization of the nurserymen of California, that association will meet in conjunction with the fruit growers and county horticultural commissioners. The opportunity afforded by the convention for the nurseryman, who grows the trees, the fruit grower, who buys the trees, and the county horticultural commissioner, who inspects them while in transit from the nurseryman to the fruit grower, is bound to result in a better mutual understanding than has existed in the past. The great development of the horticultural industry of California has been due in no slight degree to the initiative displayed by the nurserymen, and it is a great step in advance that they will convene at the same place and during the same week with the other horticultural interests of the state.

The vegetable growers, profiting by the experience of the fruit growers in standardizing the pack of fruit, have taken great interest in standardization of vegetables. A Vegetable Growers' Conference has been arranged to be held at Riverside on Monday and Tuesday of Horticultural Week for the purpose of formulating plans for applying the standardization law to the packing of vegetables, and for the purpose of discussing uniform rules and methods for the certification of potato seed. Representatives of other states who are interested in these problems will be present and a very interesting program and a fine attendance are assured.

For those interested in entomological problems, it is of interest that the Pacific slope branch of the American Association of Economic Entomologists will hold their annual convention at Riverside at the Citrus Experiment Station during Horticultural Week.

In addition to Horticultural Week at Riverside, smaller conventions are planned to take place some time during the last week in May at Hemet and Yucaipa. At these meetings the program will be limited to the problems of deciduous fruit growers and as many of the representatives from other states are interested in deciduous fruit growing, there is no doubt that very fine programs will be arranged.

Can Not Trust to Foreign Inspection of Nursery Stock



THE main arguments of objectors to Plant Quarantine No. 37, which will greatly restrict the entry of nursery stock and other plants and seeds, beginning June 1, 1919, are that either no pests are brought in on such imported stock or that thorough inspection abroad would eliminate any undesirable insects. There is no question but that the chief exporting foreign governments have given to their nursery stock the best inspection which human skill and science can afford. Failures, says the United States dpartment of agriculture, are due to the human equation and to conditions not subject to change, which make inspection and certification insufficient safeguards.

The inadequacy of such inspection since 1912, when it became operative, is shown by the findings resulting from reinspection of imported material at destination in this country. Data gathered by the United States department of agriculture show that there have been received from Holland 1051 infested shipments, involving 148 kinds of insect pests; from Belgium, 1306 infested shipments, involving 64 kinds of insects; from France, 347 infested shipments, involving 89 kinds of insects; from England, 154 infested shipments, involving 62 kinds of insects; from Japan, 291 infested shipments, involving 108 kinds of insects; from Germany, 12 infested shipments, involving 15 kinds of insect pests. Many of these intercepted insects are not known to be established anywhere in this country and numbers of them, if established, would undoubtedly become important farm, garden or forest pests.

SUPPORTS FAMILY BY CANNING

The sale of her canned fruits and vegetables has enabled a woman in Albemarle County, Virginia, to feed and clothe her eight children the last two years. When war was declared her eldest son enlisted in the navy. In a few months the second son went into the army, and the mother was left to wrestle with the problem of providing three meals a day for the eight younger brothers and sisters. About this time the home demonstration agent of the United States department of agriculture and the state agricultural college was teaching the women in that locality how to can. With a garden which could raise plenty of fruit and vegetables, and with wild fruit to be had for the picking, the mother of ten decided therein lay the solution of her problem. Results have proved that her judgment was right. Thousands of cans of fruit and vegetables have been put up and sold from this country home. One lot the home demonstration agent helped her sell brought $125.

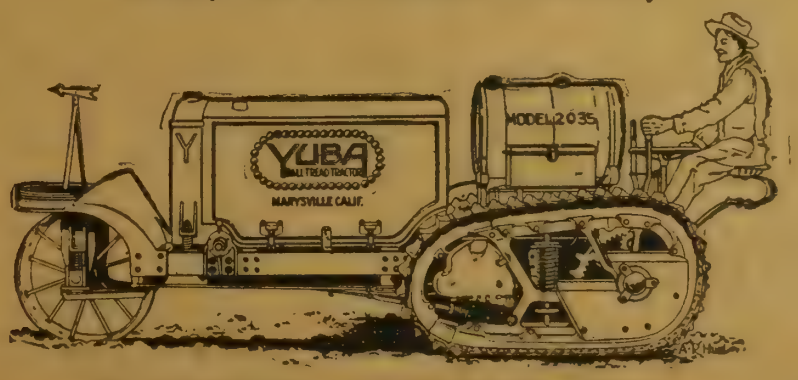
Oil and Sweat do not Mix

CROSS THE STREAM FROM HORSES TO TRACTORS IN ONE STRIDE

"A drop of sweat to grow a grain of wheat!"—that was true when perspiring men and lathered horses toiled in sun-beaten fields.

But modern machinery has helped to lift the dreary burden of horse and man drudgery. To-day a drop of oil raises a hundred stalks of wheat!

But make the change from horses to a tractor in one step—not in two! You will soon be dissatisfied with the limitations of a cheap machine. Is it any better to sweat over a tractor than behind a horse?



The "*Ball Tread*" has in seven years developed from an experiment to a triumph! Discriminating farmers now buy the YUBA because it relieves them from the worry of field breakdowns—because it makes them independent of soil or weather conditions—because, though not inexpensive, it is a lasting investment.

The YUBA is as free from wear and trouble as human ingenuity can today devise.

Cross the stream from horses to tractors in one stride—not in two! Get the best machine.

Let oil raise your crops—oil and distillate!

Ready for Immediate Delivery

There are three sizes of YUBA Ball Tread Tractors:

12-20 " 20-35 " 40-70

Write us for the catalogue of the size you need; tell us how many acres you farm, and the kind of soil.

The War's Lesson for the Farmer

By G. M. Walker, Secretary-Treasurer of the California Tractor and Implement Association

THE war taught many lessons to the farmers of this and every other country in the world, just as it taught lessons to industry and commerce. In a broad sense it has taught all these the lesson of preparedness, of being ready to grasp the big opportunity or to meet the big emergency when it is confronted. The farmers who were prepared to continue and enlarge their work under the handicap of scarcity of labor, horses and mules were the ones who were best able to serve their country's need and to reap increased profits for themselves.

The war forced farmers to a realization of the advantages of power farming, which natural procrastination would have otherwise delayed for years. The shortage of labor and the sending of hundreds of thousands of horses and mules to France left the farmer handicapped at a time when his labor and power resources should have been increased. There was not only the regular work to be done, but bigger crops had to be raised. The world demanded food and war had laid its heavy hand upon so many hundreds of thousands of acres that heavy demands were made of those countries still able to produce. Thousands of farmers who for one reason or another had delayed the adoption of power farming methods were thus forced to an acceptance of this modern aid to better crops and larger profits. And the tractor in the emergency made good as it had already made good for the progressive element who had already turned to power farming.

But the war not only opened the way for the tractor on the farm by increasing the need for it; it also proved in a direct way the tractor's ability to handle the heaviest work, to undergo the most severe strains of severe service, to perform consistently under conditions that were much more severe than are even found in agricultural work. The dependability evidenced by tractors in war work is the strongest possible proof the farmer could ask for of their suitability to his needs.

The tractor was originally and has for years been peculiarly a machine for the farm. Almost at the beginning of the great war it was adopted for military use, and the chapter thus opened of tractor use in warfare is one which will never be closed until warfare itself shall have ceased.

Confronted with the necessity for heavy mobile artillery to offset the initial advantages of the Teutons, the British war department began to investigate tractors at the very beginning of the war. In September, 1914, Holt engineers went to England with a standard farm "Caterpillar" tractor and astounded the British artillery officers with a series of tests covering hundreds of miles over difficult country. Thereupon the "Caterpillar" tractors became a definite and highly important factor in the organization of the whole British army; orders were placed for all the tractors Holt had available, and manufacturing orders increasing quantity continued for four years. All artillery of six-inch caliber and over were hauled by these tractors. The mobility of the allied heavy artillery became infinitely greater than the Teutons; the great value to the allied cause of tractors in 1915 and on was indeed beyond estimate.

England bought thousands of tractors, used them in France, at Gallipoli and Suez, in Mesopotamia, Palestine, East Africa. France bought many and commandeered a number of tractors of the larger size from privately owned big estates in Tunis. Russia likewise ordered a quantity.

A British army engineer had in 1913 or 1914 heard of the "Caterpillar" tractor's performances in some demonstrations near Antwerp; one of his friends had written him that "Here was a Yankee farm tractor that could climb like hell." It had long been a scheme of military scientists to build a mobile field fort or armored protection for infantry in both offensive and defensive against machine gun fire; the traction question was the great obstacle. But when he heard of this tractor he set to thinking; when he realized what terrible toll of British lives was being taken by the countless German machine guns he knew his problem was more vital than ever; when the "Caterpillar" tractor was adopted for artillery use by the British army he saw in this tractor the answer to his problems. The armored fighting machine known as the "tank" was thus inspired by the "Caterpillar" tractor.

The tanks were made under great secrecy. It was noised about that they were water tanks for use in Mesopotamia, hence the name. When holes were cut in the big boxes for mounting guns, the word was given out that they were revolving snow plows for use in Russia. Each one was labeled, "With care, to Petrograd."

They were a complete surprise to the Germans. How well they did their work is common history. The Germans never evolved an adequate defense. Their own brief attempt at tank warfare failed utterly through the crudeness and clumsiness of their machines. The tanks not only cleaned up the machine guns, but they drew the fire that would otherwise have wiped out regiments. Frederick Palmer, war correspondent, says the tanks saved 20,000 lives on the Somme in the fall of 1916 alone.

The smaller, faster two-man tank came along to act as skirmisher, cavalry or destroyer, according to choice of metaphor. Thousands of British, French and American built tanks led the way in last summer's overwhelming rush.

Profiting by the experience of England and France the United States went into the war with a motorized artillery program on a scale that set nearly a hundred plants at work making tractors, assemblies and parts.

As early as 1911 an army officer was impressed with the possibilities in the tractor for hauling artillery. Soon afterward the matter was brought to the attention of the chief of ordnance. It was not until May, 1915, however, that the first army test was arranged at the Rock Island arsenal. It is significant of the country's state of mind with respect to preparedness that even at that date, nine months after the war started, there were such meager funds for army experimental work that the tractor and truck companies participating bore the cost of the demonstration.

Combinations of mud and heavy grades duplicated the conditions to be found on the Western front, and from the results it was decided that "Caterpillar" tractors and four-wheel drive trucks could take guns and ammunition anywhere that teams could handle them. The big "75" easily handled two complete sections of six-inch howitzer material through wet gumbo soil and was pronounced capable of handling at least one section anywhere under war conditions.

This demonstration was of purely commercial types of trucks and tractors, but the report of the tests in the Field Artillery Journal estimated that the saving by motorization of a 4.7 or 6-inch battery would amount to $36,000 in first cost and $30,000 a year in maintenance. This was at current home prices and took no account of the saving in personnel (63 men per battery); the saving in shipping space with machines and fuel as against horses and forage; the saving in road space on the march, or the great gain in speed and endurance.

A tentative decision was made in favor of a tractor to weigh about 13,000 pounds, and a 45 horse power "Caterpillar" tractor was shipped in November for a test at Fort Sill, Oklahoma, by the field artillery board. Colonel Granger Adams supervised the test, which was reported by Captain Bryden in the Field Artillery Journal, as a complete success. Grades of 30 to 40 per cent, according to this report, were negotiated with a complete section—two 4.7-inch guns, caisson, and limbers with filled chests, a total of 17,000 pounds. A gun was deliberately mired until it rested on its trail and apron, but was easily pulled out with a cable.

It was found that the tractor could take its load handily along a railway track and across trestles, which would

be out of the question with horses. The ease with which it handled the ordinary work of two eight-horse teams, even where horses could not be used, led to the decision to motorize our artillery, and the Field Artillery Journal for January, 1916, outlined an equipment of tractors, trucks and motorcycles to displace animals entirely.

Three "Caterpillar" tractors with slight changes for special army convenience, were shipped to Hawaii early in 1916, and later in the year 27 more of the same type followed. The Ninth Field Artillery, United States Army, stationed at Honolulu, became practically one year before we entered the war, the first complete motorized artillery regiment in the world, motorized with commercial vehicles designed and built in American factories.

A five-ton tractor made a non-stop run in June from Detroit to Dayton, 225 miles in 34 hours, elapsed time. A ten-ton model taken from the previous day's production, started from Peoria, October 28 for Detroit, 480 miles, and though geared to only three miles per hour, made a record non-stop run, reaching Detroit in 143½ hours. The motor was then allowed to run up to a total of 151 hours, and the tractor was found to be in such excellent condition that it was started at once for Aberdeen, Maryland, 1500 miles away.

These tests, however, are hardly more severe than those to which tractors were subjected during the border trouble by both the quartermaster and engineer corps. When Pershing's expedition started into Mexico a number of "Caterpillar" tractors were rushed by express to build and maintain roads for the supply trains over the deserts of Mexico. During dry weather the heavy trains incessantly pounded the alkali soil into clouds of dust, and during the rainy season the roads washed badly and became almost impassable with mud. Only by a continual scraping away of the loose material, a reversal of the crowning process, could a firm surface be maintained. Six tractors to 160 miles of road meant almost continuous work, but they were equal to it.

Some of these same machines were used later in hauling quartermaster supplies from Marfa, Texas, on the Southern Pacific railroad to the scattered troop stations along the Rio Grande. Army engineers declared the short cut through Pinto Canyon to be impassable for a tractor train because of its steep grades, sharp turns, rocky passes and deep sand, but the big tractors made regular round trips with loads of 20 to 40 tons.

The tractor's performance in the war is the final proof that even the most exacting farmer could demand. Its record forever classes as a fossil the farmer who revives the ancient criticism: "Well, these tractors are a new fangled contraption and I'm not going to take a chance on them." The tractor has proved its worth. Its place is forever established.

AVOCADO MEN PREPARE FOR ANNUAL

The California Avocado Association will hold its fourth annual meeting, May 9-10 at Hotel Maryland, Pasadena. Friday forenoon, meeting for members only. Informal dinner Friday evening. After dinner addresses by Messrs. Sallmon, Adams, Sharpless, Hardin, Shedden, Elliott, Barbour, Keller, Webber. Friday afternoon, President Sallmon's address; Early introduction into California, Juan Murrietta; Commercial Possibilities, Dr. Eliot Coit; Reports on Frost Damage, Charles D. Adams.

Saturday forenoon, Hillside Planting, J. M. Elliott; Outlook for Industry, C. F. Kimmon, U. S. D. A.; Markets, George S. McClure; Avocados in Mexico, Wilson Popenoe, Agricultural Explorer, U. C.; Exhibit at Liberty Fair, Lester Keller; Committee on Varieties, Dr. H. J. Webber; Proper Maturing, Professor I. J. Condit. Saturday afternoon devoted to discussion of marketing and other problems before the association.

Men will soon be put to work grubbing sagebrush on land acquired by the Washington state college for a state irrigated farm experiment station. Water will be available later in the season from the Prosser pumping plant and the tract will be cropped as soon as possible. Some temporary buildings will be erected this summer.

Fruit Crop Report---Quality, Quantity Finest Ever

FRUIT crops of California will generally be a little later, a little bigger and of higher quality than for many years. This in a word expresses early estimates made by Cultivator readers as shown by short extracts from their letters below. Of course any estimates made this early in the season are subject to revision, therefore we wish to bespeak for those who have aided the Cultivator so generously consideration of the fact that changed weather conditions may materially alter these estimates. There is no certainty until the fruit is in the box.

In connection with these estimates for a generous crop it is gratifying to note that inquiry for fruits to be delivered six months later are keen and that some sales are reported while trees are yet in bloom. On this matter of prices note this from the San Jose Mercury of April 20:

"Why has a persistent offer for 11 cents been made for prunes in this valley? Why has 12 cents been offered in Napa County? Why is it that a few weeks ago, before the blossoms were even out offers of 7½ to 8 cents were made and now, before the fruit is set, the offers make such a spectacular jump? Interesting questions to be sure. The answer:

"Speculation pure and simple!

"Why does the California Prune and Apricot Growers' Association absolutely refuse to quote any kind of a price to anyone, grower or buyer? Why is the association refusing point blank to accept orders prior to May 1, and why are the orchardists 'sitting tight' in the face of the most tempting offers that have ever been made in the whole history of the industry?

"Again the answer is the most obvious thing. Nobody knows what the crop is going to be or precisely what the market is going to be worth. The association has written speculation and gambling out of its working vocabularly. In its stead it has written protection to the grower in great red letters. And having done so, having set the growers' interests as its guide post, the association cannot name a price on its products until it knows what that price is going to be, and it cannot know the price until it knows the crop."

Again, as to quantity of fruit note this as to apricots in Hemet News:

"Unless the Hemet ranchers look after the thinning of their apricots within the next week it will be too late, and the cannery managers are calling special attention to the importance of prompt action.

"The set of apricots was never so heavy in the history of the valley and growers are warned that a tree is capable of producing only a certain amount of fruit, and if the trees are not vigorously thinned the fruit will be small and of less value per pound. Manager House says that many orchards should be thinned fifty per cent in order that a maximum quality of fruit may be produced."

Cultivator readers report:

W. D. Butler, Horticultural Commissioner, Napa County

Apples, 100 per cent; apricots, blighting, 20; cherries, thrips, 75; peaches, curl leaf and blight, 80; pears 100 prunes 100.

Gifford L. Sobey, Secretary Chamber of Commerce, Paso Robles, San Luis Obispo County

Almonds 90 per cent apricots, 75 cherries, 100; peaches, 100; pears, 110 prunes 100

J. C. Metzgar, Secretary Santa Ana Chamber of Commerce, Santa Ana, Orange County

Apples, too early to estimate; apricots, prospects excellent, but somewhat early to judge definitely; peaches and pears little grown.

A. L. Shively, Santa Paula, Ventura County

Almonds, few grown; apricots, indications are 75-80 per cent.

H. J. Baade, Farm Adviser Napa County

Apples, 100 per cent; apricots, 50; cherries, 75; peaches, 90; pears and prunes, 100. Outlook at present very promising.

Chas. F. Collins, Horticultural Commissioner Tulare County

Apples and apricots, good setting; peaches, heavy setting; pears and prunes, few grown but showing good setting.

C. G. Marchus, San Pasqual, San Diego County

Apricots very light. At first we had a full crop set, but owing to cold the

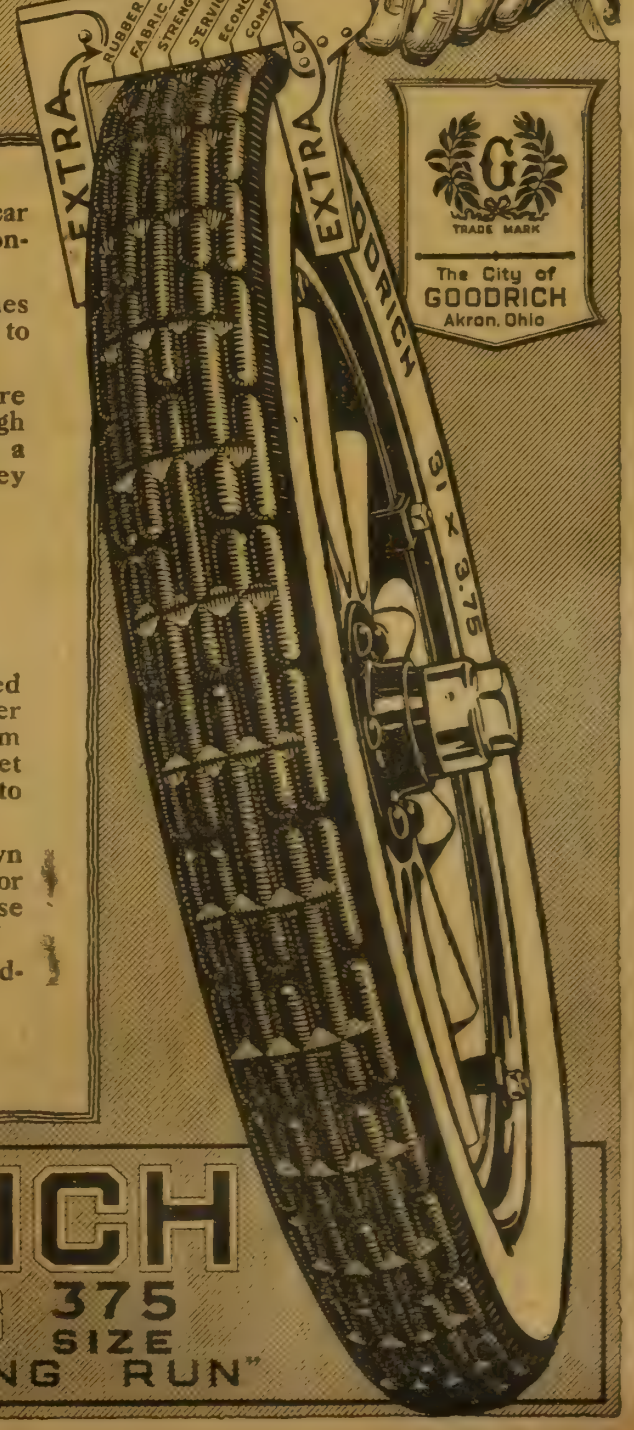
FORD CAR OWNERS!
You Need Goodrich
"Three-Seventy-Fives"

BECAUSE they make more of your car to you and your work, in comfort, economy, and power to do.

"Three-Seventy-Fives"—their name comes from their size, 31x3¾ inches—are built to meet the peculiar needs of Ford cars.

Made bigger than ordinary size tires—more fabric and rubber in them, bulkier through and through, with *wider tread*—they lift a Ford car to a new field of efficiency. They lessen stress and strain on your car.



Though they are an inch larger in circumference, and a full 3¾ inches in cross section, they fit 30-inch Ford car rims. They come only with the five safety bar tread.

Their slightly higher cost is quickly wiped out in greater comfort, and in their longer life. Go to a Goodrich dealer and ask him for "Three-Seventy-Fives" and you will get an easier riding, finer looking car, able to do more and harder work for you.

For a higher power car, Goodrich Silvertown Cord Tires give more power to you. For a truck, a growing factor on the farm, use Goodrich Truck Tires.

Remember always, that a farm on a Goodrich basis is saving money in its tires.

This Month in the Vegetable Garden

Northern California

By A. R. Gould

THE need for food production is still as great as ever. There is still time to plant plots, large or small, and if the ground has not yet been prepared apply the sprinkler for a few hours and spade up deeply a day or so afterwards when the ground will be in fine shape to dig, and do not forget that farm yard manure trenched in will give results in abundant crops. As we mentioned in the ornamental department there is the same problem of insect pests and it will be necessary to watch closely for practically the same foes and use the same methods of combat, but a systematic line of action will soon give results and save much trouble in the future besides removing these foes.

For irrigating many prefer to use the furrow method, which is very effective, and others prefer the various types of sprinklers, and here we would say that the finer the spray the less danger of the surface soil being sun-baked. When seed sowing use the best seed and sow thinly. The wheel cultivators are a real help in almost any garden.

Beans

Continue to make successional sowings of these during the month, using the varieties as advised last month, such as Golden Wax, Refugee, etc., and pole beans such as Kentucky Wonder. Those sown last month will be showing now well through the ground and should have attention in the way of cultivation between the rows. At the first sight of black fly or aphis spray with "Black Leaf 40," and should red spider or mite appear on the underside of the leaves spray with sulphur solution. Poles should be placed to support the climbing types of beans.

Tomatoes

Those already planted out will require watering and cultivating at intervals for a few weeks after which they will soon establish themselves. Do not delay planting this crop as they require several months to produce. Strong plants can still be obtained in the best varieties from the nurseryman. If the single stem method of growing is adopted the plants will need supporting by stakes and the young lateral shoots produced in the axis of the branches should be removed.

Onions

Seedlings of these where they are still to be thinned out may be replanted in rows for extending the onion plot, and the soil should be pressed firm around them when planting, while a few inches of the top foliage should be removed. Keep this plot well supplied with water and applications of soot or wood ashes will help greatly.

Pepper and Egg Plant

Secure plants of these. Chili and Bell peppers are good varieties and usually grown, while Early Long Purple is an excellent variety of egg plant. Plant about two feet apart in fairly rich soil.

Corn (Sweet)

Sow Country Gentleman, Golden Cream and Golden Bantam in rows two to three feet apart, and about one inch deep, placing several seeds in each group. Eventually thin out to three plants to the group. Corn thrives best in a rich soil and should be fairly well supplied with water.

Cucumbers, Melons and Squash

There is still time to sow these if sown at once, and we gave full directions for culture last month, also varieties.

Carrots

Thin out this crop, leaving the plants four to six inches apart in the row for the large rooted varieties. French Forcing may be grown three inches apart in rich soil. Make a sowing for succession of this variety, also Oxheart and Danvers half long.

Turnips

Sow Early Snowball or White Egg in rows two feet apart in rich soil.

Lettuce

Thin out those sown last month and transplant the strongest seedlings keeping the plot moist for a few days.

Potatoes

Keep the cultivator busy through this crop.

Peas

Make a sowing of the variety Melting Sugar.

Southern California

By D. F. Reichard

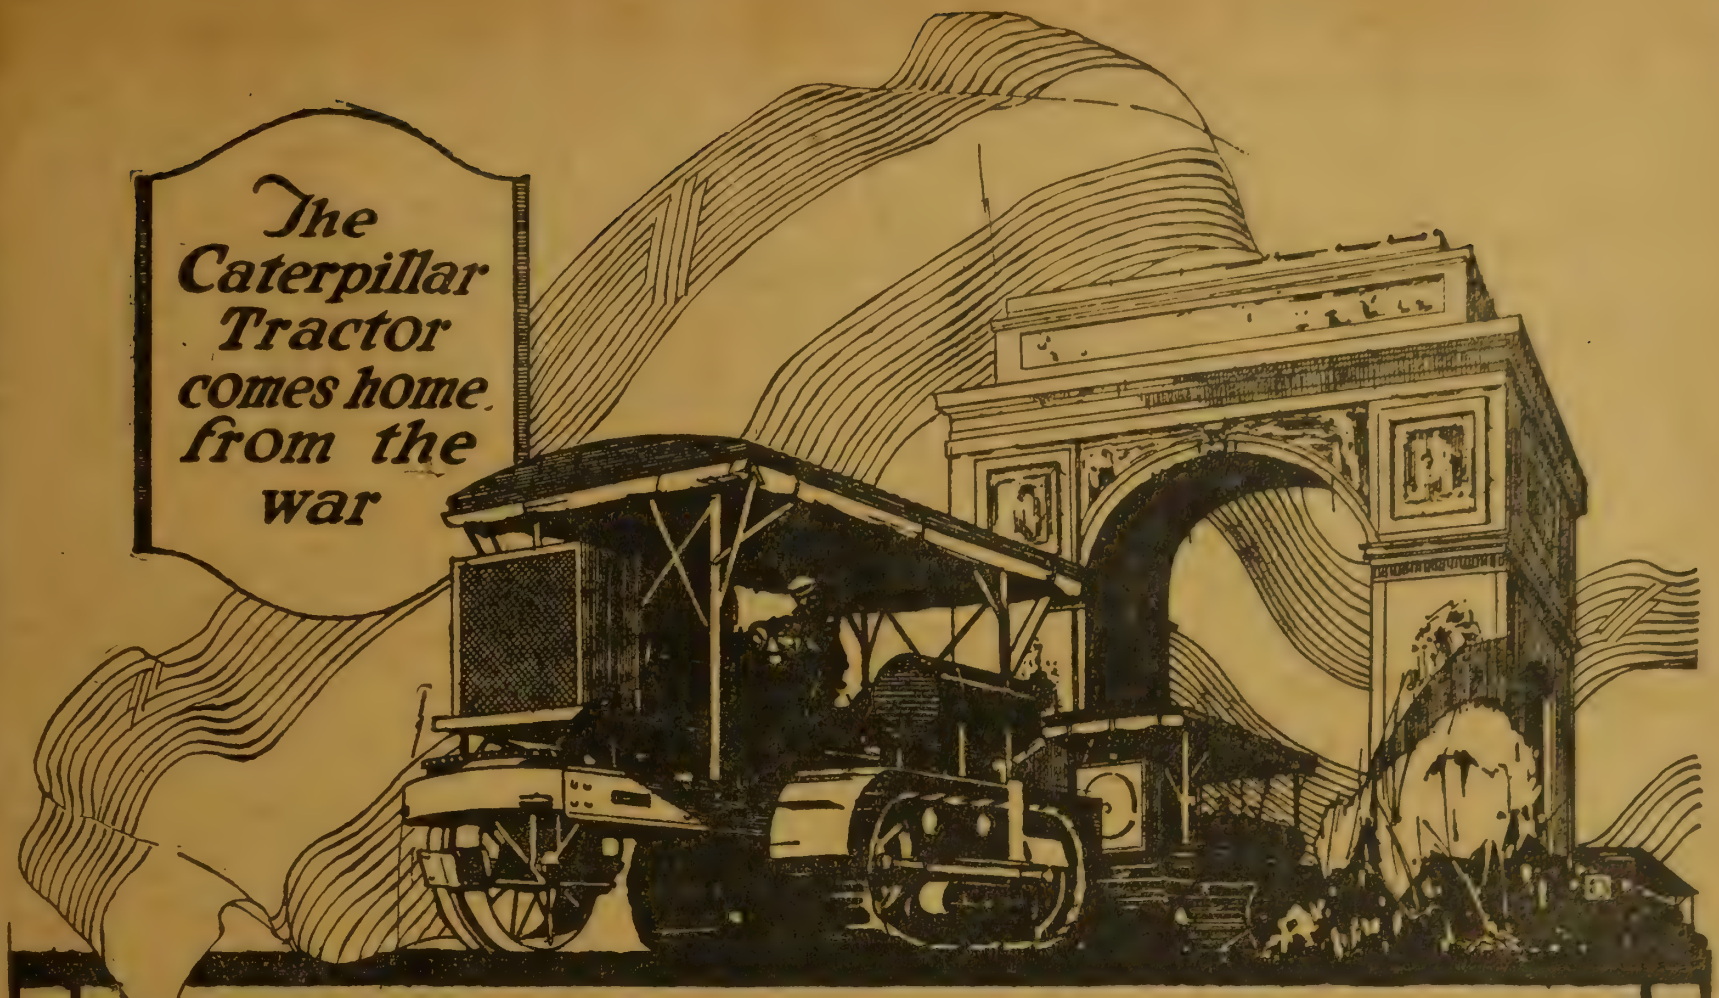
VEGETABLE gardens are the order of the day. The prospects are that they will nearly all be successful gardens, too. The interest taken in home gardens the past two years has resulted in the developing of thousands of gardens and the proper methods of handling them. This is gratifying because we must not forget the 20,000,000 tons of food we have promised Europe this year.

For those who have not their gardens under way there is still time to prepare for summer crops. Wet the ground to be used thoroughly and work up by spading or plowing at least ten inches deep and pulverize. If there is a heavy growth of weeds on the piece clean them off because turning under so much roughage at this late date allows too much air space and the soil dries out before the young plants or seed that you put in could get well started. Roughage or green manure should be turned under while there is still enough time and natural moisture to decay it.

The yearly fight on garden pests is at its height during this month. Unless one has been very diligent and taken all known precautions there will appear from all sides garden enemies; aphis, slugs, weeds, mildew, gophers, moles and others.

At the first sight of aphis or thrips spray thoroughly with Black Leaf 40, a tobacco preparation. Probably the most destructive pests are the chewing ones, such as slugs, snails, worms and beetles. For these arsenic poisons are used either in the dry form as a dust or mixed with water and sprayed. A preventive for snails and slugs is to dust powdered tobacco or air slacked lime around the plants. Fungus is controlled and prevented by the use of Bordeaux Mixture, lime sulphur solution or sulphur. Gophers and moles are most successfully controlled in the garden by the use of traps. Thorough cultivation helps materially in the control of pests as well as keeping the soil in proper condition.

Seeds and plants of most all kinds of vegetables may be sown this month with the exception of peas, turnips, cauliflower and winter cabbage. This is an especially good month to start beans, muskmelon, casabas, watermelon, corn, tomato, peppers and all tender vegetables which require warm weather.



SOUTHERN GARDEN NOTES

By A. L. Clarke

Every California garden should have a little row of rhubarb. There comes a time every season when there is a gap between the old and the new fruit crop, and this gap is bridged very satisfactorily by pie plant, or rhubarb.

Rhubarb is a heavy feeder and for best results requires a rather rich and light soil. It can be grown from seed, but the more satisfactory way is to buy roots from reputable nurserymen

The Caterpillar Tractor comes home from the war

FOCH launches a drive. Yanks, Tommies and Poilus hurl themselves against the enemy line, and drive it back—slowly at first, then faster, and finally the enemy is in full retreat with the Allied Infantry right at his heels.

But the position is a dangerous one. It may be a trap—it might be, were the "doughboys" unsupported. But not this time! For the Allied Motorized Artillery is right behind the infantry, ready to throw a protecting barrage at a moment's notice.

Motorized artillery, and therein lies the secret of its effectiveness. Officers and men in automobiles and motorcycles; supplies and lighter ammunition in motor trucks, and heavy guns and caissons hauled by "CATERPILLAR" TRACTORS.

Now that hostilities have ceased, the part which the "CATERPILLAR" Tractor did toward winning the war is no longer a state secret.

Long before America entered the war The Holt Manufacturing Company was supplying "Caterpillar" 75 and 45 Tractors to the English and French. And as early as 1915, the U. S. Bureau of Ordnance, too, had conducted extensive tests and had decided to equip the first entirely motorized artillery corps the world had ever known—using "Caterpillar" Tractors exclusively for the heavy work.

These tests brought out—and four years of the most strenuous war service confirmed—two outstanding advantages of tractor-drawn artillery.

First, it was more efficient—could go faster—could go *anywhere,* regardless of the weather and no matter how shell-pitted the terrain.

Second, it was more economical—men and money were saved for important service elsewhere.

Of course, only the "Caterpillar" Tractor would do for the most strenuous war-time service. The self-laying-track principle, first successfully applied to a tractor by Benjamin Holt, and *proved out* in peace times upon thousands of the farms of America and other countries, was peculiarly fitted to conditions upon the battle-fronts. And the "Caterpillar" Tractor, both of itself and as the mighty armored "Tank" was able to do an incalculably great part in the overthrow of autocracy.

But at last the stress of war is ended and the Holt factories are again on a pre-war basis, able to make immediate deliveries of "Caterpillar" Tractors and prompt shipment of extra parts, released from important Government demands but strengthened by their war service and experience.

The same efficiency of principle; the same rugged construction—the same "Caterpillar" Track design, turning engine power into drawbar pull with minimum loss and enabling this tractor to work anywhere, any time—all the qualities which won for the "Caterpillar" Tractor honor upon the battlefields of Europe—are at the disposal of American Agriculture as in the days before the war.

Reconstruction time should be tractor time. Write today for full information regarding the "Caterpillar" Tractor—ask for Catalog 395.

"Caterpillar" Tractors built only by Holt or under Holt contracts and patents—the only track type of tractor adopted, after rigid tests, for the hardest war service of America, England and France

THE HOLT MANUFACTURING COMPANY

Stockton, California Peoria, Illinois
Spokane, Washington Los Angeles, California

CATERPILLAR

Reg. U.S. Pat. Off.

or growers and thus save a year's development. In planting the roots do not cover the crown with dirt and give adequate irrigation. The stalks should not be pulled the first year, but blossoms should be removed. In pulling stalks on mature rhubarb, give the stalk a sharp twist to one side and it will come off easily.

Giant Winter Crimson is the popular California variety, but New Strawberry is a promising new variety.

In the coastal region of Orange County this year melon growers are planting onion sets with their muskmelon seeds to keep the squash bugs away. It is claimed that the bugs object to the onion odor and will keep away from the vines in which they are planted. Some skeptical ones, however, will continue to dust their vines with ashes or lime as a preventive measure.

It isn't too late to plant a row or two of roselle in your garden, and nothing will add more to your pleasure and satisfaction. The seed should be planted three feet apart each, allowing for enough to thin plants when up. Do not cover more than an inch deep. The roselle makes a jelly that is a real rival to currants and is a most prolific producer. The blossom somewhat resembles okra bloom and the stalk is valuable for its fibre.

A beach gardener declares that he can always drive out marauding gophers from his garden with stale fish heads. The hole is excavated and the fish heads dropped in.

Now that the rains are over it is all essential that moisture conservation be practiced in order to save irrigation during the coming summer. The dust mulch has been found the best method of conserving the moisture in the soil, but the pulverized surface not only arrests the capillary rise of moisture, but it should as well check it at a point out of reach of the free entrance of air to the loose layer. There is no hard and fast rule as to the depth of this dust mulch, but if the top layer is scraped away by the foot to the depth of a couple of inches and there is no moisture underneath it must be assumed that the ground was not thoroughly prepared before planting.

If one has a garden of any size, even a full lot, a wheel hoe is almost a necessity. There are several makes on the market, ranging in price from $4.00 to $20, but often real bargains in second hand ones may be had for half or less the original cost. In furrowing out for planting and irrigating, making a dust mulch and keeping the weeds in control the wheel hoe reduces labor more than half and gets better results. The Norcross hoe cultivator, costing less than a dollar, is another fine tool for the garden if one hasn't a wheel hoe.

Don't let the weeds get a start. Remember they take from the soil both moisture and fertility.

Another don't—don't cultivate or work among your beans while they are damp from dew or fog. Rust will follow if you do.

This Month in the Ornamental Garden

Southern California

IRIS of nearly all varieties are now in full bloom. There are literally hundreds of varieties, and this is the season for the home maker to open eyes and use note books as to varieties which will be wanted for planting in July or August. The later blooming varieties may still be fertilized so as to push larger and more luxurious flowers. It's the poor man's orchid. Don't forget the iris.

One may still plant dahlias where dormant tubers are to be had, but it is too late to divide plants which were left in the ground over the season. Dahlias are wonderful bloomers and persist from early summer until frost comes.

Gladiolus may also be planted. Those which were planted in January are now several inches high and ready for fertilizer and abundance of water.

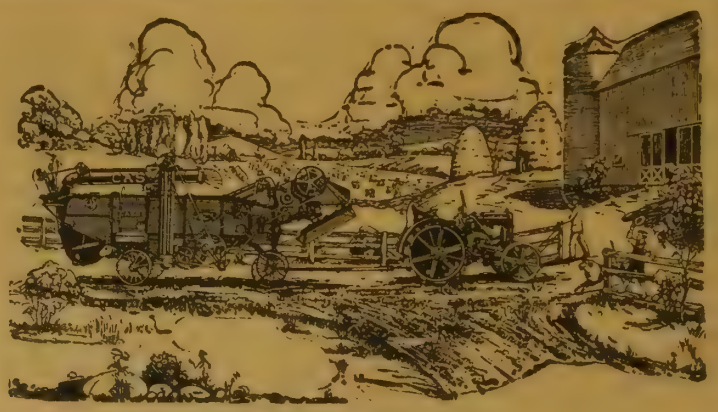
Daffodils and other early bloomers are now ripening their bulbs and later in the month may be ripened sufficiently so that when the leaves turn yellow they may be lifted and stored in cool, dark place or in dry sand. After the bulbs of these early spring bloomers are thoroughly ripened it is better to lift them and dry off during summer months and give October or November planting.

Coreopsis is now coming into bloom and in a short time will be scattering seed everywhere and a crop of volunteers next year will result. These plants are worthy of more atention, especially for neglected or out of the way corners.

The plant grower must bear in mind that the warmer, trying days are coming, and all plants not given abundance of moisture are sure to suffer. At this season a mulch of clippings from the lawn or of leaf mold about the roots of choice plants aids them in resisting the greater heat of the interior valleys.

Perennials such as chrysanthemums, violets, golden glow, goldenrod, Shasta daisies, and other plants subject to root division or growing from tip cuttings, should be given atention. We believe this class of plants give more for the effort than most others in our gardens. The method of dividing is to take up a clump of the roots and break off each slip or young shoot and set the young plantlet by itself. They are almost sure to grow and give a wealth of bloom in September and October.

Excepting on the lawn, do but little "sprinkling". A spray of moisture over the leaves of some of the plants at evening time is most agreeable to them, but irrigation of the soil calls for drenching and a supply of water which goes to the lower depths of the roots.



Northern California

By A. R. Gould

THROUGHOUT the month moisture will be an all important factor, and it is essential that this be carefully studied. Conservation is the chief aim, and cultivation of the surface soil will be in order. Then again we can resort to mulching. Trees and shrubs will need it and leaves or farm yard manure may be spread around the roots. This will not only help to hold the water until the roots have been soaked when the sprinkler has been used but will also hold the moisture in the soil. For mulching smaller subjects, such as annuals and perennials, clippings of lawn grass can be used, but of course we would not advocate even this if the lawn contains weeds, but then a real lawn should be free from weeds, otherwise the seeds will be distributed over the garden and there is nothing worse than burr clover and dandelion for becoming a general pest, necessitating extra labor to eradicate. The water problem, however, is the greatest from the careful grower's standpoint. To know when a plant needs water and when to withhold is often times the secret of raising what are often known as delicate plants and will prevent the loss from the common cause of "damping off," of which so many complain. Hence the best plan is to study your subjects and only water when your plants really need it. Furthermore, the type of soil will also have to be considered. Plants grown on a light, sandy soil will naturally need more water than those grown on a heavy, stiff clay or adobe. We would also advise a raid this month on the plant pests, no matter whether insect or fungoid. Do your bit to make the plant world safer for our friends to live in. Among the I. W. W.'s of the insects are aphis, green, brown or black fly, meally bug, white or red spider, cut worms, caterpillars, slugs and snails. For aphis or meally bug a gentle dose at intervals of "Black Leaf 40;" for mites, use sulphur in solution, and arsenate of lead will destroy cut worms as a contact poison, in fact is excellent for leaf eating insects, which also refers to caterpillars. With regard to slugs and snails these are very much in evidence just now and are very busy during the night when many may be caught at work. A pocket flashlight will assist. During the day they will be found in hiding in various thick clumps of perennials, under heavy foliage and behind small rocks and under boxes, in fact they carefully select their hiding places, and it will be advisable to destroy them now before they increase their number. They very quickly attack young shoots of

delphiniums, goypsophila and any young seedlings, hence they are a dangerous pest.

Among the fungoid pests or diseases we have rusts, which attack roses, grasses, hollyhock, carnations and snapdragons, and these are practically all different. Then there is mildew, which is prevalent also on roses, delphiniums and other subjects. These fungoid diseases are hard to prevent as they are mainly governed by sudden changes in temperature or weak stock, which often results from cross breeding. Hybrids are especially subject to attack by fungus, and we find among the roses that hybrid varieties are often victims. If the plants are very severely infected it will be better to burn them. Furthermore the speres would very quickly spread to other plants. As a preventive or if the disease is suspected, spray with a solution of sulphate of copper or Bordeaux mixture. Mildew is a troublesome disease and has been known to cause havoc among many plants. At the first sign of an attack sulphur should be applied either in dry or liquid form. The latter is to be preferred.

Successional Flowers

To have a continuous display of flowers is the desire of most garden lovers, and while it needs a little extra forethought and labor yet it is possible to so arrange things that you can have a variety and plenty to cut from if seeds of annuals are sown at intervals. We would advise sowing the following at once: Snapdragons in variety, Shirley poppy, nasturtiums in variety, nemophila, nemesia, stocks, mignonette, larkspur annual, gypsophila, marigolds, French and African types; godetia, centaurea, calliopsis, balsam, candytuff, asters and arctotis grandis. These should be sown in well prepared soil on a semi-shaded border and transplanted, with the exception of Shirley poppy and mignonette which should be sown where they are to flower and very thinly broadcast.

Dahlias

Complete the planting of these popular flowers this month and see that the tubers have rich soil to thrive in. There are now some thousands of varieties, of many shades and comprising several types. These are excellent for decorative purposes, in fact many beautiful new colors may also be secured from a packet of seed of single dahlias, and these should be sown at once in a box of light soil in a warm situation.

A Rare Summer Flowering Shrub

Cantua Buxifolia is very choice and very hardy. It is of drooping habit and the fuchsia-like flowers are of a crimson shade. It delights in a sunny position, and should be grown in fairly rich soil.

Eugenia Myrtifolia

This very handsome shrub makes a splendid hedge and when the new growth appears in the spring the red tints are most effective. It can also be grown as a specimen shrub and should be in every garden.

WOOL GROWERS MEETING AT DAVIS

If plans materialize that were proposed at the annual meeting of the California Wool Growers Association at the University Farm, April 25, the sheep industry of California will be organized on a basis that will greatly strengthen the industry.

President Fred A. Ellenwood suggested that the time had come when the association should become more active and proposed that a secretary, preferably a man thoroughly acquainted with every angle of the business, especialy marketing, be employed, and that he would devote his entire time to the work of the organization.

The suggestion met with the approval of all and a plan for financing the work is being considered.

Drs. J. A. Payne and J. H. Hammond of the bureau of animal industry and Dr. J. P. Iverson, state veterinarian, reported on the scab situation. Considerable scab exists in various sections of the state, principally in Northern ranges. The condition is not considered alarming. The governmental and state officials declared that with proper cooperation on the part of sheep owners the disease could be controlled and eventually eliminated. The association decided to go before Governor Stephens and urge that he sign senate bill 747 which appropriates $9000 for scab control work during the next two years.

O. M. Shaw, president of the Imperial Valley Wool Growers Association, outlined the plan of organization and operation that has proven so successful in the marketing of mutton and wool from the valley. According to Shaw the organization which was started last October operates along cooperative lines and at the present time includes 60 or 70 members owning about 120,000 ewes. Practically all of the lambs and fat sheep controlled by the association this year have been marketed at Kansas City at an advance of 50 cents to $2.50 over Coast markets. The association also markets wool to advantage. Shaw stated that as a result of the organization the members had secured better prices, and at the same time the consumption of mutton had been stimulated in the community.

C. E. Rachford of the United States forest service stated that the mountain ranges were in better condition than for several years.

Chas. A. Kimble of Hanford offered a resolution, that was accepted, assessing the members one-half cent per head, 50 per cent to be used in scab control and the balance for other purposes.

J. H. Holman of the Federal Wool Company, Boston, made an interesting exhibit of wool, and told the sheep men of the advantages of properly grading and scouring wool.

The following officers were elected for the ensuing year: President, Fred Ellenwood, Red Bluff; vice president, Chas. A. Kimble, Hanford; treasurer, Frank Bullard, Woodland. The office of secretary was left open, pending the materialization of the plan to employ a permanent secretary.

A Three Day Trip of the Southern California Duroc-Jersey Association

By R. K. Walker, Secretary Southern California Duroc-Jersey Association

In honor of Fred De Vore of the Duroc Bulletin, the breed paper, the Southern California Duroc-Jersey Association conducted a three day auto party visiting all the Duroc herds in Southern California.

Mr. De Vore is considered one of the best hog judges in America and has been instrumental in bringing before the public a large number of the boars that today are making the breed so popular. Mr. De Vore can see but one type of hog, one that is big and one that is of the correct type. He is a rabid opponent of the "just medium good hog."

The first visit was to the Donald Graham herd at Lancaster where his great boar was seen. This boar was junior champion at the California Liberty Fair and is certainly a splendid specimen of the breed. Mr. Graham is mating him to some fine sows.

Next morning the party assembled at Conejo Ranch, Newberry Park. H. H. Braly brought out his giant son of the world's famous Pathfinder. The crowd took to him at once. Mr. De Vore pronounced him one of the best boars on the Pacific Soast. They have also a fine son of Great Sensation and a splendid collection of over 50 real brood sows. Pigs by Councilor, the 1918 California State Fair grand champion, are looking like real prospects.

At the Elliott Brant Ranch, Owensmouth, a herd is just being started, but no money is being spared to begin with the best. This herd will be heard from. In fact they have already sold one boar for $1000.

At Dr. Creamer's Ireland Ranch at Owensmouth, the Riverside grand champion boar, Cherry Volunteer 2nd, was the main attraction. He is getting some fine pigs and one of the visitors could not help "talking business" and came away the owner of an extra good boar pig. Two extra good Great Model gilts were also shown which were out of the litter that the Doctor cleaned up with at the Liberty Fair.

J. C. Craig next showed the party his good start of Critic bred gilts at his new ranch east of Owensmouth.

The Stevenson herd at Van Nuys is small but they have the right kind of a start in a litter of pigs by Great Model out of an Orion bred dam.

De Vore said he would give W. B. Hewitt the palm for being the best feeder he had seen on the Coast. Mr. Hewitt showed us the yearling gilts and boar he won on at the Riverside and the Liberty Fair; Mr. De Vore said that with one exception the boar was the largest for his age he had seen in America. Pretty good for California.

At the W. Charles Swett herd on the state highway, we saw a real good grandson of Pathfinder. This boar, together with a number of gilts, was bought in the East for him by Bert Manley.

After a night in Los Angeles we visited the great new breeding plant being installed at Spadra by Mr. Lewis. It is called the Diamond Bar Ranch and Walter Gatton is the manager. Already a double brooder house is built 200 feet long and will be extended 500 feet more as the herd increases. The foundation of this herd includes 60 top animals bought from the Conejo Ranch and includes the great boar Great Wonder 2nd. A pen of gilts by a son of Great Sensation was an attraction to the crowd. Great Sensation just broke all world's records for all breeds when 50 sows bred to or sired by him sold at Stanton, Nebraska, for $1021 each.

H. S. White showed us some mighty fine sows either bred to or sired by Rivera Col, his great son of Model Col. Mr. White's herd includes daughters of Grand Model 8th, Model Col, Cherry Friend, and Grand Golden Model.

At the George, Jr., Republic, R. A. Condee and Mr. Davis took great pride in pointing out the results in farming and in breeding Duroc-Jersey hogs and Holstein cattle, by the 60 self-governing boys. They have done well and Mr. De Vore pronounced their sow De Vore Model Lady to be one of the best he had seen on the Coast.

At Fontana Land Company's ranch at Fontana we saw a very nice boar from the Hoover herd in Oregon, and an extra good son of Great Model and Cardinal Lady C., which Mr. De Vore pronounced to be the best junior yearling prospect he had seen on the Coast.

J. S. Prendergast has a good herd of Durocs at San Bernardino. He has sows by King the Col, Great Model, and a son of Great Wonder. We also saw a good young boar prospect by the Hanks and Bishop boar Col Select and out of a Golden Model sow.

Falfadale Farm at Perris was the next stop. Here Bert Wilkinson showed us the largest boar in California and

Monarch Tractor

See It at the Sacramento Tractor Demonstration

The Sacramento Demonstration will present an excellent opportunity for you to see what the Monarch Tractor DOES. Watch it PULL. Note the POWER. See it GRIP THE SOIL. Observe how readily it RESPONDS to every desire of the driver. Keep your eye on the Monarch as it swings a circle in its OWN LENGTH. Be especially wide-awake when it hits the rough spots and see how each track ACCOMODATES ITSELF to the unevenness of the soil without throwing the tractor out of line, straining the frame, or reducing the pull.

To miss the Monarch is to miss the BIG FEATURE of the demonstration.

Questions and Answers

ANSWERS BY EDITOR AND STAFF

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Slimy Milk

Will you please tell me the cause of our milk turning slimy the day after it has been separated? We feed our cattle Lima bean straw and wild oat hay with a mash of bran and alfalfa molasses night and morning. The cows are in good condition but get no green feed. Is the milk fit for use?—Subscriber, Encinitas.

Probably the trouble to which you refer is the most common of all dairy infections. We do not think the trouble is with the feed or with the cow, although there is a possibility it may be due to garget or a diseased condition of the cow's udder. In this case there is liable to be bloody milk. Where it occurs the day after milking it is a case for utensil inspection. This is a bacterial trouble and is most persistent and a thorough cleansing of all utensils and stable surroundings is necessary. The bacteria is sometimes brought to the dairy by creamery and milk distributing centers. Thorough scrubbing with warm suds followed by application of boiling (note that it must be boiling) lime water or, better, disinfection with live steam will correct the evil. Regarding the use of milk for food "Practical Dairy Bacteriology" by H. W. Conn, speaks of milk which is slimy from growth of bacteria several hours after milking as follows: "Such slimy milk is apt to be counted as a total loss, for it is usually regarded as absolutely worthless. But there is no reason to think that the milk is really unwholesome. Indeed, in Norway the people are fond of such milk and frequently use artificial means to produce it, preferring slimy milk to the ordinary kind. In this country slimy milk is thrown away or fed only to pigs. Since the sliminess does not appear until the milk is several hours old, no loss ensues when the milk is used immediately."

Strawberry Leaf Spot

Prof. H. S. Fawcett of the state experiment station gives further information as to leaf spot of strawberries. He writes:

These spots contain the fungus known as Sphoerella fragariae. This is a common leaf spot of strawberries. Moisture and heat are said to favor the disease, while moisture upon the leaves is necessary to infection. Weather favorable to infection followed by hot, dry days, may bring about considerable injury. Plants growing upon heavy, wet soil are apt to suffer more than those upon dryer soil. I find that Stevens and Hall in their book on "Diseases of Economic Plants" gives the following comparison of the resistance of various varieties: Blight very rare—Daisy, Eureka, Jewell, Triumph de grande. Blight rare—Belmont, Lady Rusk, Scarlet Queen. Blight frequent—Annie Forest, Bomba, Bubach, Burt, Captain Jack, Covill, Crawford, Cumberland Triumph, Dutter, Gandy, Gold, Gypsy, Haverland, Henderson, Itaska, Jessie, Lida, Logan, Mammoth, May King, Miami, Ontario, Parry, Pearl, Phelps, Pineapple, Primo, Summit, Sunset. Blight abundant — Barton's Eclipse, Cloud, Gandy, Pride, Great America, Loudon's 15, Piper. Blight very abundant—Monmouth, Ohio, Photo, Sanafee, Warfield." Stevens and Hall also suggest that frequent change of beds, also cutting, gathering and burning or burying of tops in place after harvest will often lessen the disease. The use of Bordeaux spray after the removal of the diseased leaves may also lessen the infection of the following year.

Breeding Up R. I. Red

I would like some advice about a Red pullet I have. She is just a year old and commenced laying in November at a few days over six months old. She has laid 132 eggs in 157 days, which I consider fine. For a long time her eggs were rather small, and still I think they are a trifle undersized. They hatch fine but about half the chickens have stripes on them like Brown Leghorns. The others are a solid color. They grow well and are even larger at three months of age than some of the two-year-old hen's chicks. She is supposed to be a pure bred and is mated to a cock I bought from a 240 egg trap-nested pen. I am sure the trouble is with the hen as it has not shown up in the others. Could I honestly pick the solid colored chicks of hers and try to breed up a fine bunch of pure bred chickens or would it just keep cropping out later? I would not want to sell chickens or eggs and not have them be what they should be, but she is making a better egg record than my other hens and I hate to have to cull her pullets out. —M. B., Linsday.

One cannot always tell by the looks of young chicks what they will look like when they are grown, but if the chicks that are hatched with stripes still show them at three months of age or older, a cross of some sort, very likely Brown Leghorn, would be indicated. By breeding the solid colored pullets to a male of unquestioned pedigree, you will eliminate the stain in time, but there may be some throwbacks for a long time. Just how long depends on how deep the stain is. It seems to me I should not want to sell the eggs as pure bred until I had tried them out myself and learned just what per cent were likely to be striped. There will be fewer next year than this, if you mate each year to a pure bred male. It was just in this way, by mating pure bred males to mongrel females, that the Rhode Island Red breed was built up in the first place. Certainly you should not discard so good a layer, even if you do have to breed out the results of a cross. Why not breed her by herself for a while and see what you get, in production as well as color?—J. A. K.

Roup of the Eyes

What causes chickens and turkeys to get swelling of the head and then some white stuff starts to grow in the eyes and if I don't put something in their eyes they lose them? Last fall one of my turkeys lost one eye that way. What is the best thing I can do to cure them? I have been using iodine and peroxide.—Subscriber, Oxnard.

Your birds have roup of the eyes, which is often associated with false membranes in the throat but sometimes appears without other symptoms. Harrison & Streit recommend washing the eyes twice daily with two per cent boracic acid in a decoction of chamomile flowers. I presume any druggist could put this up for you. Drop into the eye with a dropper or from a bit of cotton. A one-half per cent solution of corrosive sublimate is also recommended, but this must be handled very carefully since it is very poisonous. The disease may come from weakness or roupy tendency in the breeding stock, and it may be due to dampness or lack of

ventilation in their sleeping quarters. To a certain extent it is contagious, that is, one bird with a chronic case of roup might go through the summer without much inconvenience to herself and then in the fall pass on the disease in aggravated form to the young turkeys and chickens.

When you have cured the existing cases your work is only half done. Roosting quarters must be made clean and dry, with plenty of fresh air, and all the birds that have been sick must be banded so that they will never be used in the breeding yard. Many expert poultrymen believe that the only way to eliminate roup from their flocks is never to doctor the disease but to kill every sick bird as soon as the disease can be diagnosed. This seems heroic, but it certainly saves trouble.

Mildew—Aphis

I enclose leaves of a climbing rosebush. Please tell me what it is infected with, and what to do for it. Have been told it is mildew. Also is there any spray that will kill the little green flies that are thick around the rose buds?—Subscriber, Patterson.

These leaves are seriously infested with mildew, for which a safe treatment is powdering leaves with best grade of flowers of sulphur. This can be scattered over them every few days, preferably in the morning when covered with moisture. The success of this treatment depends largely upon warm weather following the application. The sulphur will have no effect on trees already affected but may prevent spread to others. The small green flies, or aphis, can be knocked off by spraying with strong stream of water, or you may use a spray of tobacco extract. This is a commercial product and full directions for application will be found on container.

Canker in Squabs

I have lost several squabs of late from a hard tumorous growth on the intestines, sometimes forming after the squab is about half grown. It is of a whitish yellow, cheesy appearance and seems to sap all the vitality. I supply salt, grit, charcoal and good wholesome grain and green food. Could you suggest a remedy?—Subscriber. Palms.

The disease referred to is termed canker. It generally starts to form when the youngster is three or four days old and appears on the umbilical cord, commonly called navel. If the parts around the navel are pressed, the growth, which is small at that age, can be pressed out, after which an application of Munsell's Solution should be applied. If the case is one of long standing the growth will have become very much enlarged and fastened itself on the entrails, in which case I have never known one to recover. If taken in time, however, a large percentage can be cured.—H. R. S.

ESSENTIALS IN AFTER-THE-WAR AGRICULTURE

Now that farming is to be restored to a peace-time basis, the United States department of agriculture believes that many lands formerly devoted to pasture but recently used for emergency grain production should be reseeded to grass.

The signing of the armistice found the United States with relatively large supplies of foods and relatively small supplies of feeds, with much land somewhat impoverished by having been planted to grain year after year, and with a still urgent demand for meat and fats.

Numbers of all classes of live stock have been maintained. Those of swine and sheep have been increased, the former largely, the latter slightly. But the quantities of forage and pasturage for live stock have been diminished.

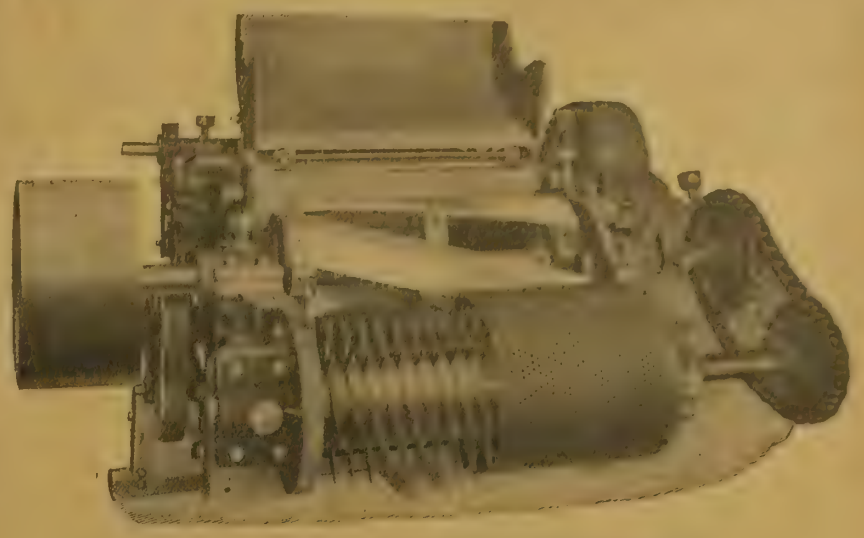
Sound agricultural practice demands the reestablishment of regular and satisfactory rotations so that fertility may be restored and the live stock carrying capacity of the land increased.

Live stock, since it helps to retain fertility on the land, provides a profitable use for large amounts of roughage and gives employment to labor throughout the year, should find a place on a larger number of farms.

Diversified farming should become more general, to the end that each farm shall produce the necessary food for its family and the necessary feed for its live stock.

Loss from preventable plant diseases should be guarded against by seed treatment and spraying.

Harvesting of fruits and vegetables before exposure to frost, and greater care during harvesting, packing, storing, and marketing, are urged, together with continued organized efforts for the prevention and control of diseases of animals.



California Wonder Corn

The result of ten years' selection. Produces six times as much as common corn. First prize winner at San Francisco Land Show. Quick and big returns from a small investment. All seed produced from corn bearing 5 to 12 ears per stalk. Grows 10 to 16 feet in height, producing enormous crops of very rich ensilage. Choice selected seed for sale at reasonable prices, shelled, on the ear and stalks with all the ears on them. Our illustrated booklet, giving full history and details of this wonderful money-maker, sent free on request.

THE SMALLEY RECUTTER

Showing SECTIONAL VIEW with Screen Cut Away

Double Cut — No Grinding

Meal Capacities — Silo fillers in sizes **12, 14, 16, 18, 20** and **26** denote the length of the knives in inches on each size. Meal capacities of these silo fillers are figured at ninety pounds per cutting inch, with the 5-16-inch screen on the recutter when the machine is set to cut ¼-inch. These capacities are based on the cutting of good grades of hay. Capacities in straw would be reduced. Alfalfa cutters in sizes **20, 26, 36** and **40** also denote the length of the knives in inches. The meal capacities of these machines are figured at one hundred pounds per cutting inch per hour, based on good grades of hay.

Menominee Economy — Commerce Dependability

Here is the Best Evidence of our Claims of Menominee Truck Performance:

I. B. NETZLEY,
Citrus Ranch, Glendora, Calif.
Dairy Ranch, Chino, Calif.

Glendora, April 15th, 1919.

Menominee Motor Truck Agency,
1205 So. Olive St.,
Los Angeles, Calif.

Gentlemen:—At the time I was considering the purchase of a motor truck for work at my citrus ranch in Glendora and Dairy at Chino, Calif., you made some positive but modest claims for your Two Ton MENOMINEE Worm Drive Model and after operating it for sometime now wish you to know that I am fully convinced that every representation made as to ECONOMY in operation and DURABILITY of construction has been substantiated by its splendid performance.

At one time I owned and operated a Chain Drive Truck but after using the MENOMINEE it is now my opinion that, especially for RANCH and FARM work generally, the WORM DRIVE TYPE is better adapted and far superior in every way.

You said that if I purchased a MENOMINEE, I would soon join your long list of satisfied USERS and BOOSTERS and I enroll herewith.

MENOMINEE certainly means ECONOMY.

Yours very truly,
I. B. NETZLEY.

CALIFORNIA BREEDERS SALES & PEDIGREE CO.,

C. L. HUGHES, Sales Mgr. Sacramento, Cal.

James McGillivray Buys Two Herd Bulls

When James McGillivray, Sacramento, dispersed his entire herd of grade Holsteins on April 29 he made more room for the better handling of his excellent herd of registered Holsteins, which now numbers around 250 head of females from calves up to mature cows, and for the further improvement of his pure bred herd has recently secured two royally bred young bulls who will take their places at the head of the herd.

The oldest one of these is by Champion Echo Sylvia Pontiac, son of the great Canadian cow May Echo Sylvia, who is also famed as the dam of the $106,000 bull Carnation King Sylvia. Champion Echo Sylvia Pontiac is by Spring Farm Pontiac Cornucopia, whose dam is K. P. Pontiac Lass, 44 pound daughter of King of the Pontiacs.

The dam of this bull is Princess Stella Segis, with official records of 29.88 pounds butter from 507.2 pounds milk as a senior four year old, and she is a daughter of King Pieter and out of Countess Segis, a 31.70 pound daughter of King Segis. The seven nearest dams of this young fellow average 582.55 pounds milk and 31.75 pounds butter in seven days, and the fourteen nearest dams average 573.65 pounds milk and 29.45 pounds butter in seven days. He is a high class individual of unusual promise, and when it is considered that among his first seven dams there are such cows as May Echo Sylvia, Countess Segis, K. P. Pontiac Lass, May Echo Verbelle, Blanche Lyons De Kol, there is every expectation that he will transmit outstanding type and production.

The younger sire secured by Mr. McGillivray is sired by Rag Apple Korndyke Colantha, who is by Rag Apple Korndyke 8th out of Colantha Pietertje Korndyke, 30.80 pound junior four year old daughter of Pontiac Korndyke. The dam of this youngster is Abby Hartog Clothilde 2nd, 27.16 pound four year old daughter of Admiral Walker Gelsche and the famous producing and breeding cow Abby Hartog Clothilde, 31.39 pounds butter in seven days. Five of the seven nearest dams of this young bull average 578.28 pounds milk and 31.3 pounds butter in seven days. An interesting and significant feature of this young bull's pedigree is the fact that five of his seven nearest dams have produced 22 A. R. O. daughters six of them with records above 3 pounds butter in seven days.

These two richly bred young sires will be used on the large number of daughters of Dutchland Sir Korndyke Colantha and King Pontiac Ruby Burke now in the herd, as well as the good list of mature cows by other sires.

A Grandson of May Echo Sylvia

Owned by James McGillivray, Sacramento. One of the most highly bred registered Holstein bulls in California.

Urges Hog Raisers to Join in State Wide Marketing Organization

THE California Swine Breeders' Association which will meet in annual session at the University Farm, Davis, April 10th, is planning a campaign the object of which is to induce every hog raiser in the state to join the association in the formation of an organization of state wide proportions and representing the entire industry. On March 17 C. B. Cunningham, president of the association, appeared before the convention of farm advisors held at the University Farm and outlined the contemplated campaign and solicited their assistance. Cunningham said in part:

"Twenty five years ago more hogs were produced in California than are produced here today, but the quality left much to be desired. Prices were rarely over six cents and I remember one year when the prices were only two cents. It used to take anywhere from 18 to 30 months to get a hog up to average weight. The poor quality produced and the poor prices paid caused many to quit, and the industry lagged.

"Not so very many years ago, say six or seven, it was claimed that over $30,000,000 was spent each year outside of this state for the pork products we consumed, and it was felt that if this big amount could be kept at home it would mean much to every line of business operating within the state. How could it be accomplished?

"About seven years ago a few breeders met at Davis and the California Swine Breeders' Association was started. We started with but 23 members and selected for our slogan 'More and Better Hogs.' We have accomplished much, but there is plenty yet to do.

"Five years ago 70 per cent of the packing hogs killed in California were produced outside of this state. In 1917 practically the entire kill of packing hogs were produced within the state, and quite a few carloads were shipped out on foot. In 1918 just closed I believe that the same holds ture. This is where the "More" part of our slogan was carried out. Now for the "Better" part. At a number of the meetings of packers held in San Francisco last fall and winter, and also in numerous newspaper articles the largest packers of both San Francisco and Los Angeles stated that the quality of the hogs received by them during 1918 were equal to and compared favorably with the best received at eastern stockyards. I am not claiming we did it all, but we certainly started it and kept the good work going. Education, a constant repetition, week after week, has brought about this change.

"We are producing more and better

pork, and our hams and bacon, California grown and cured, are slowly but surely forcing the Eastern brands out of our local markets. The coast agent of a certain large Eastern packing firm told me recently that not more than 20 per cent of cured ham and bacon was arriving in California now as compared with arrivals of five years ago.

"Our state organization, while it lacks considerable of being all it should, still is a good nucleus to work with. Our present membership is between 400 and 500, widely scattered throughout the state, and this membership probably does not represent over 12 or 15 per cent of the number actually engaged in the production of swine.

"Nearly every farm bureau in the state has included among its activities for the present year's work the two projects of live stock and marketing, and if we are to produce more and better live stock we must first be able to assure the producer that he can realize a reasonable profit over and above the cost of production, and the only way he can be given that assurance is by having the right kind of an organization that can take care of the marketing end and help him to get his stock in market condition in the shortest possible time and at the lowest possible cost. By having the producer work with the department of animal husbandry and the extension department he can be started right.

"During the past year while serving as a member of the Federal Live Stock Commission this fact was deeply impressed on my mind: that for the live stock interest of this state to be successful it was necessary for the live stock producers to get together in a state wide organization.

"Mr. Nares, president of the Cattlemen's Association, and also a member of that commission, has perfected an organization that is by far the best of its kind in the United States.

"The directors of our association have undertaken the work of getting all the swine breeders of the state into a similar organization. It will be difficult, but I feel quite certain that with the cooperation of the different farm bureaus throughout the state it can be accomplished.

"California should be the greatest live stock producing section of the United States and we should produce not only enough to supply the needs of our 4,000,000 population, which will soon be here, but to have a big surplus for export to South America and the Orient as well.

"The results such a large state organization can accomplish are almost endless. A very few of the most important are: securing the proper necessary legislation; the best possible markets; preventing individuals and corporations from taking undue advantage in different localities; attending to sales, shipments, feed and all kinds of supplies and in fact putting the industry on a perfectly safe basis.

"I fully realize that certain counties in the state have splendid organizations that are handling the marketing end most successfully at present, but I believe that I can see a future when these auction sales are not going to be as satisfactory as they are at present and we must be fully prepared to meet that condition when it does arrive, if it does, and have some definite plan of marketing that can be successfully substituted for the present system. I do not expect the present auction plan to be unsatisfactory in the very near future, but the stronger the organization back of them the longer they will continue. We must consider human nature and realize that a custom of many, many years will not be done away with unless something forces it into the discard.

"Packers have always been ready and willing to buy at the lowest possible price that will secure the goods and will be very loath to pay any more than they are absolutely forced to pay.

"I note that the bureau of crop estimates have recently published their report of the animals on hand on the farms of California on January 1, 1919. This report shows that 1,000,000 hogs were on the farms on this date as compared with 947,000 on January 1, 1916, showing an increase of 66,000. Dairy cattle show a loss of 7000, while other cattle show an increase of 92,000. Sheep show an increase of 493,-

Imported and American Bred
Percheron, Belgian and Shire Stallions

000. These figures are food for thought.

"I believe that the heads of the extension department are fully agreed that all producers of both primary and secondary crops should be organized into state wide associations at as early a date as possible, for it is only by organization that the producer can be assured of that amount to which he is entitled.

"To my way of thinking the present plan of the Cattlemen's Association is the best so far devised—the forming of county associations, grouping of these county associations into certain zones and then joining these zones into the state organization."

This question of organization is in the air as never before. The swine breeders are now well organized and will accomplish still more if the great majority of growers now remaining independent will affiliate.

The Bernstein Sale

By Bruce S. Bennett

The second annual sale of Poland-Chinas by W. Bernstein, Hanford, clearly shows what can be accomplished by hard work, integrity and close application of breeding principles.

Sixty-eight head were sold, 30 of which were pigs, about one-half the remainder young gilts of October and November farrow, and made an average of $106.33. It was stated by a number of breeders present that this was a remarkable average considering the age of three-fourths of the animals sold.

The top of the sale was No. 6 in the catalog, a sow by Jumbo Wonder, by King of Wonders and out of Ben's Wonder by Big Ben. The bidding was brisk from the beginning but finally narrowed down to A. Buckland of Fresno and F. E. Fay, owner of the Ox-bone herd, Tipton. The sow went to A. Buckland & Son for $600.

Six sows in the sale made an average of $260.83; the gilts, $126.41; the pigs, $42.91; and the young boars, $98.33. The sale totaled $7230.50. Col. Bell of Tulare was the auctioneer and not only demonstrated his ability as a salesman but his thorough knowledge of Poland-China pedigrees.

Following is detailed report of sales:

2. Boar, C. L. Weaver, Tulare, $125.
4. Sow, W. E. Martin, Visalia, $310.
5. Sow, W. C. Ficklin, Fresno, $150.
6. Sow, A. Buckland & Son, Fresno, $600.
7. Sow, J. E. Post, Selma, $200.
8. Sow, J. W. Jones, Carruthers, $105.
9. Gilt, Fred Ross, Hanford, $115.
10. Gilt, H. D. McCune, Lemoore, $225.
11. Two gilts, John Bernstein, Hanford, $115 each.
12 A. Boar, C. L. Weaver, Tulare, $120.
12 B. S. pig, Chas. Lewellyn, Hanford, $40.
12 B. 3 s. pigs, G. W. Clark, Porterville, $36 each, $108.
13. Gilt, T. W. Chapman, Hanford, $85.
14. Gilt, D. S. Troth, Tracy, $132.50.
15. Boar, L. Melchoir, McFarland, $125.
16. Boar, T. E. Cochrane, Hanford, $60.

38. Gilt, W. L. Haag & Son, Hanford, $105.
39. Boar, W. J. Wallace, Delano, $75.
40. Boar, J. L. Creelman, Lemoore, $95.
41. Pig, W. E. Martin, Visalia, $100.
42. Pig, H. D. McCune, Lemoore, $60.
43. Pig, R. Saunders, Porterville, $60.
44. Pig, G. J. Wilton, Fowler, $30.
45. Pig, A. B. Brooks, Kingsbury, $20.
46. Gilt, G. I. McCune, Lemoore, $180.
47. Gilt, H. D. McCune, Lemoore, $80.
48. Pig, Harrold Waltz, Lemoore, $50.
49. Pig, same, $50.
50. Pig, J. H. Felse, Carruthers, $22.50.
51. Pig, B. M. Hargis, Tulare, $25.
52. Pig, W. C. Ficklin, Fresno, $27.50.
53. Pig, E. G. Almgren, Reedley, $35.
54. Pig, W. C. Ficklin, Fresno, $22.50.
55. Pig, C. Lewellyn, Hanford, $30.
60. Boar, M. M. Dyer, Chowchilla, $120.
61. Gilt, W. C. Ficklin, Fresno, $155.
62. Gilt, C. H. DeRaad, Lemoore, $175.
63. Gilt, Cross Bros., Merced, $190.
64. Sow, Mrs. Carrie L. Brooks, Hanford, $200.
65. Pig, Mrs. G. B. Martin, Visalia, $45.
66. Pig, Eunice D. Steele, Hanford, $50.
67. Pig, Mrs. C. D. DeRaad, Lemoore, $47.50.
201. Gilt, H. E. McMahon, Lemoore, $135.
202. Gilt, J. Bernstein, Hanford, $110.50.

Korndyke Segis Star Rena

Butter, seven days at four years 26.68 pounds, 30 days 107.83 pounds. She is the daughter of Star Rena Wayne Pietertje 2nd, 34.36 pounds butter at three years, and the 37 pound sire, King Segis De Kol Korndyke. She is the mother of the $3100 heifer. To be sold at a McAlister & Sons dispersal sale May 21-22.

A THREE DAY TRIP

(Continued from page 625)

some pigs by him that justify Bert's confidence in the big son of Orion Cherry King, Jr. He is being mated to daughters of Grand Golden Model and Grand Model 8th.

At Hemet Charles Tyler and Mr. Bell showed us their second prize National Swine Show boar, Cherry Friend. They are raising mostly for market but have a good nucleus for a pure bred herd in this $1000 boar. One sow by Grand Golden Model and her daughter by Cherry Friend were outstanding individuals in the herd and De Vore was insistent on buying the older animal to ship East but could not pry her from her California home.

After a night at San Diego the party visited the Winsor Ranch at Bonita. Of course the great attractions which R. K. Walker and M. C. Allen had to show were the great breeding boars Great Model and Grand Golden Model, and the twice grand champion sow Model Defender Lady. Mr. De Vore not only called this 800 pound sow the best on the Pacific Coast but one of the best in the world. Cherry Blossom, the 1916 Riverside grand champion sow, and about 50 brood sows and bred gilts were in evidence.

The idea of letting every Duroc breeder see every other breeder's herd was a great success. Ninety per cent of the men did not realize the improvement that had been made in the last 18 months in Southern California Duroc herds. There will be the greatest show of Durocs this fall ever held on the Coast.

STRAY THOUGHTS OF A COWMAN

By A. L. Spellmeyer

What is the matter with the Western cattle men; are they crazy? is the question asked by one of the big Northern men who is hitting the ball this year for about 15,000 head. This man has been on the move for six months, Chicago one week, Dakota the next, Los Angeles the next, and knows general conditions. He is a cowman and a good one, is wealthy and honest and no fledgling.

He asks this question after seeing all the cows for sale and after seeing the people go after steers. He asks if all are going into the steer business what is to become of future production? This man realizes the true condition and is backing it to the limit. Fifteen thousand cattle mean a strain on the resources of a millionaire.

The El Paso convention did not bring out any great activity in cattle trading, although some selling was done.

There is something wrong with the cattle industry. It is in a chaotic condition. The trouble must be financial. With grass apparently certain throughout most of the country trading is dull and contracting is months behind schedule. Beef was never higher, and feed shows cheaper prospects daily. The ranges are holding cattle, considering increased expense and proportionate advance in feeders and beef, considerably under value. There is $15 to $20 variation in the prices asked for yearling steers in various Southwestern districts, something hitherto unknown. Some sales are being made but not many as a few speculators are creaming good bunches at low prices. The men who have to buy some time during the year are afraid, and inactive.

The rumor persists that Los Angeles is to have a stock yards and let us hope there is something to it.

Why don't they put live stock down on income tax inventories at uniform valuations, as do counties and states? The stock men all have it figured differently.

DESCRIBES LIBERATION OF LIVE STOCK FROM DISEASES.

"Recent results in the control of animal diseases give a vision of a new day in which the American stock raiser, freed from the ravages of some of his foes and with others brought under subjection, can pursue his calling in greater security, and increase his contributions toward supplying the growing needs of the world."

That is the encouraging outlook for American farmers in fighting an annual preventable disease loss of $175,000,000, as described by Dr. J. R. Mohler, chief of the bureau of animal industry, U. S. department of agriculture.

After expressing appreciation for the help of American bankers and other business men in fighting animal diseases, Dr. Mohler said: "Through the joint efforts of federal and state agencies and of stockmen generally, spurred on by the unusual requirements of the present, we are pressing more vigorously than ever before our assaults against enemies that have too long preyed upon our flocks and herds."

Cotton growing experiments at the Yuma Experiment Station indicate that the heaviest yield of Pima cotton was obtained from a spacing of 17 to 19 inches. The highest yield of Yuma was obtained from a spacing of 13 to 15 inches.

IDEAL GREEN FEED SILOS

A Richly Bred Bull

The Veramont herd of Herefords, owned by H. M. Barngrover of Santa Clara and maintained on his ranch in Plumas County, represents one of the choice collections of Herefords owned in this state. While the herd may be new to many cattlemen, it is in reality a herd with a good many years of constructive breeding back of it. The herd was established several years ago by P. W. Snyder of Swan, Oregon, and conducted by him until it passed into the ownership of Barngrover.

Most of the females represent the blood lines that have been popular and sucessful in the Northwest as well as some of the lines of breeding that have been factors in the breed's improvement throughout the country.

The herd, while under the ownership of Snyder and since it was transferred to Barngrover, has been especially fortunate in having the advantage of the service of such a bull as Patrician 5th. It is doubtful if a bull of the breed of more attractive blood lines can be found in any herd in this state. He was sired by Patrician 4th, himself a bull of note, and a son of Paragon 12th.

Paragon 12th was by Beau Paragon out of a Majestic dam. To Paragon 12th, perhaps more than to any single factor, must the credit go for the building up of the famous Buena Vista herd of Col. Dalmeyer, Jefferson City, Missouri. For a good many years cattle from this herd played important roles in the great shows of the Middle West and during the latter part of the herd's existence it was Paragon 12th blood that was responsible for the success that was registered.

Something over a year ago Col. Dalmeyer decided to close out his Hereford interests and no higher tribute could be expected by him than to have his entire herd purchased by two of the leading breeders of the United States—Col. E. H. Taylor, Jr., of Kentucky and Robt. Hazlett of Kansas. The herd was evenly divided between these two distinguished buyers and in the division Hazlett took Paragon 12th. It was his intention to use him extensively in his famous herd, but when the Carter people of the Hawaiian Islands offered, if memory serves, $6000 for him notwithstanding that he was well along in years, Hazlett let him go. He is now in service in the great Island herd.

The dam of Patrician 5th was the good cow A. Plum Erling, a daughter of the famous Watts bull, Lord Erling, conceded by all to be one of the top sons of the mighty Beau Brummel. Lord Erling has to his credit many of the choicest breeding cows ever produced in central Missouri. The dam of A. Plum Erling was Armour Plum, one of the good producing cows in the famous Armour collection.

From the above it will be noted that there is reason to expect that Patrician 5th should prove himself a valuable sire. Coupled with his rich breeding is an individuality that is distinctive. He is a bull admirably fronted; thick fleshed, yet smooth; of great scale and ample bone. His ability as a sire may be judged from the fact that four calves by him, not fitted highly, sold in the recent Davis sale for an average of $437.

Patrician 5th

Patrician 5th, a richly bred bull of splendid individuality and ability, as a sire in service in the Veramont herd of H. M. Barngrover, Santa Clara. California needs more such bulls.

"Old Faithful"—A Real Comfort Shirt

A Sale of Washington Pure Breds

By G. N. Angell

Fifty buyers from California, Washington, Oregon, Idaho and Montana secured cattle at the dispersal sale of E. B. Marks at Yakima, Washington, when his entire herd of Holstein-Friesians, with the exception of his herd bull, Sir Bessie Fobes Tritomia, and a few head of young stock, went under the hammer for $24,770, an average of $300 each for the 82 head. The Toyon Farm Association of Los Altos, California, was the only California buyer represented at the sale. This concern secured three daughters of Sir Ormsby Burke Segis, sire of the $12,500 world record cow they now own, for $1900, paying the highest average price of any bidder. Their buyer was instructed to buy the three animals designated without regard to price, it became known after the sale.

D. M. Donnelly of Sedro-Woolley, Washington, was the heaviest buyer, paying $6350 for 20 head for milking purposes only, and Hollywood Farms of Seattle, Washington, represented by F. S. Stimson, the owner, topped the sale with $1400 for Francie Hartog, a 25 pound cow expected to freshen shortly by Finderne Mutual Fayne Valdessa, the $21,500 former herd sire at the farm of J. von Herberg of Kent, Washington. Mr. Marks made an offer of $600 for her calf, bull or heifer. Hollywood Farms bought four other animals, paying an average of $400 for three daughters of Sir Bessie and $500 for a daughter of Mutual Fobes Longfield De Kol, an A. R. O. sire and show bull that formerly headed the Marks herd. Their purchases totaled $3120, an average of $624, the second highest at the sale.

Stanley V. Butchart of Granger, Washington, who will have the use of the Marks herd sire, paid $2150 for five animals, four daughters of the Fobes bull and one of Sir Bessie. J. R. Hobson of Outlook, Washington, paid $625 for Maldeta Canary Mercedes, well known in Washington and Oregon as a state fair prize winner, and winner several years ago of the milking tests at both Washington and Oregon state fairs.

Two heifers sold by Gladys Marks, daughter of the owner of the herd, sold for $680, and John Marks, his son, sold two for $700. These were the product of breeding operations started several years ago by the younger

Better service is assured by the advertiser if when writing you mention the California Cultivator.

members of the family. Each retains a heifer for future operations.

The dispersal sale of pure bred Holstein-Friesians held by E. B. Marks on April 2, the purchase of the Toyon Farm Association of Los Altos, California, of the Tyson & McElheer herd of about 35 animals, and the purchase by Charles Fisher of Thomas, Washington, of three herds of pure breds at Grandview and Prosser leave only one herd of Holsteins of any size in the Yakima Valley, that of William Todd & Sons of Yakima. Dr. Marks expects to get back in the game within a year or two, however, and Stanley V. Butchart of Granger is getting together some quality Holsteins on the Granger farm of H. C. Davis, who was formerly a partner with Mr. Marks and who has been out of the breeding game for several years.

Mr. Fisher's purchases included those of seven head from the Buswell herd at Grandview, eight head from D. C. Bunn of Prosser and 17 head from Jasper Parker of Grandview, practically cleaning out all three herds.

Tyson & McElheer sold their entire herd, except the bull and a few calves, to the California Farm Association, through Superintendent Charles MacDonald, formerly of Yakima. At the same time he purchased several head from the herd of William Todd & Sons of Yakima.

THE FIRST WESTERN BERKSHIRE CONGRESS PROMOTION SALE

The first Western Berkshire Congress promotion sale was a decided success. Fifty pigs were sold at Martinez in Contra Costa County at an average of $50 per head.

The arrangements were made by Director J. Francis O'Connor in cooperation with Geo. P. Upham of Martinez and the Contra Costa County farm bureau. The sale was conducted by Col. Ord L. Leachman of Sacramento in a very satisfactory manner. President A. B. Humphrey, Secretary Frank B. Anderson, Directors Geo. Murphy, J. F. O'Connor, Fred Sandercock represented the congress.

Hogs were consigned by Geo. P. Upham, Martinez; James Mills, J. F. O'Connor, University of California, Sandercock Land Company, Homer Hewins, Jr., Frank B. Anderson, A. L. Stevenson, Butte City Ranch, A. B. Humphrey and R. J. Merrill & Son.

Most of the hogs went to enterprising farmers and orchardists in Contra Costa County. The buyers were: M. Pereira & Sons, Martinez; John J. Rahm, Oakley; Frank K. Burnham, Martinez; American Hog Company, San Francisco; F. J. Stewart, Martinez; Henry Frank, Clayton; G. W. Vaughan, Antioch; J. C. Dobbel, Haywards, and J. C. Pieratt, Napa, and Geo. P. Upham, Martinez.

Consignors from outside Contra Costa County were barred from bidding. Prof. J. I. Thompson of Davis was in attendance and made a good talk at the opening of the sale. The next sale will be held at Dixon May 17, 1919.

PREPAREDNESS WITH SEPARATOR

Enormous waste of grain and much loss of time result every thrashing season because of the inefficient work of thrashing machines that have not been thoroughly repaired and put in working condition before the beginning of the working season. Defective parts are overlooked or neglected in the hope that they will last through the season. When they fail in the midst of the thrashing season serious losses often result before repairs can be made. In or just before the thrashing season new parts are difficult to get promptly because of the rush of orders from many who have procrastinated.

ANNUAL MEETING AMERICAN GUERNSEY CATTLE CLUB

The annual meeting of the American Guernsey Cattle club will be held at the Commodore Hotel, New York City, Wednesday, May 14, at 10 a. m. The business of the meeting will consist of report of the year's work of the club's office, recommendations of the executive committee, election of officers. Opportunity will be given for consideration of all matters relating to the welfare of the club and its work.

Live Stock News Notes

A Register of Merit Bull to Humboldt

Guy H. Miller, Modesto, has sold the yearling Jersey bull Exile Interest to the California Barrel Company of Arcata, Humboldt County. This young bull is one of the richest bred in Register of Merit blood lines that has been sent out from Venadera herd. All the sires and dams for generations back in his pedigree have yearly Register of Merit records or have two or more Register of Merit daughters.

Belknap Gets Durocs

Guy H. Miller reports sale of four Duroc gilts to Dr. L. J. Belknap of San Jose. These are litter sisters sired by J. E. Thorp's boar Happy Heinie, son of his great sow Long Wonder's Queen. Their dam is Volunteer Maid 4th, an excellent sow of Miller's own breeding.

High Breeding

Betsy Lamb Prilly, the 32 pound, four-year-old Holstein cow owned by H. E. Vogel, Fresno, is at W. J. Higdon's farm at Tulare, where she will freshen and afterward be bred to the $6500 bull King Korndyke Pontiac 20th.

To be Tested

Walter Donders, Fresno, has sent a very promising daughter of Prince Aralia Walker over to W. J. Higdon's farm at Tulare, where she will be put on official test after she freshens and will then be bred to King Korndyke Pontiac 20th.

Two Seven Day Records

Abby De Kol of East Bank 2nd, the top cow that A. M. Bibens, Modesto, purchased at H. E. Cornwell's sale, recently made an official record of 30.64 pounds butter in seven days. She is one of the greatest breeding and producing cows in California today, and Mr. Bibens secured a most unusual bargain in her purchase.

Fair Girl Walker, a junior two-year-old daughter of Prince Hiske Walker, recently completed official records of 18.70 pounds butter from 448.6 pounds milk in seven days, milking as high as 72.8 pounds in one day. She is owned by A. M. Bibens, Modesto.

Jersey Sale This Month

A sale of high class registered Jerseys is reported under way in California for a date some time in May. If the present sale plans are carried out the detailed announcement will be one of commanding interest to Jersey breeders everywhere.

Records At Rosamaines Ranch

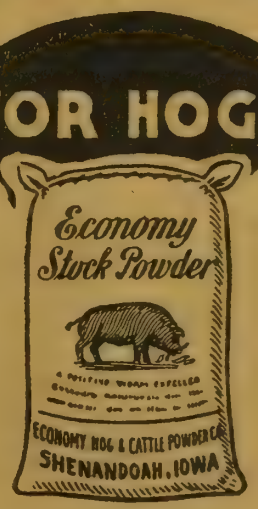
A. J. Stalder, proprietor of the Rosamaines Ranch, reports that six daughters of King Pontiac Netherland Segis 3rd have freshened recently, have been tested and the test shows remarkable production from five of these heifers: the first, a two year, one day old heifer, better than 400 pounds milk, 20.50 pounds butter in seven days; another, two years, two months, 400 pounds milk, 20.2 butter; two years, two months, 388 pounds milk, 22.50 butter; one year, 11 months, 350 pounds milk, 18.50 pounds butter; the last tested, two years, 27 days, 18.50 pounds butter; the sixth is yet to be tested. All the above remarkable records made under ordinary dairy conditions.

From Imported Sire

J. R. Carhart of Fullerton reports the purchase of a yearling Jersey bull sired by Helena's Oxford Sultan, bred by T. P. Mourant, Isle of Jersey. This bull was sired by Oxford Sultan of Oaklands and his dam was Helena's Oxford Gem. This is a fortunate introduction for California Jersey people.

Roselawn Shorthorns to Butte City Ranch

W. S. Guilford of the Butte City Ranch, Butte City, has recently purchased from Dr. H. M. Elberg of Woodland 13 head of registered Shorthorns, consisting of seven cows and six calves. Guilford states that the purchase represents a particularly useful stamp of cattle that, for the most part, carry the line of breeding that has been so successful in the Roselawn herd.



Select Shorthorn Sale July 10

W. M. Carruthers, Live Oak, has made definite arrangements to sell a very select lot of Shorthorns July 10. The place of sale will be announced later, but will probably be either San Francisco or Sacramento.

The Carruthers sale will attract wide interest because the character of

EXTRA WEAR
in Racine Country Road Tires

THE farmer is the real judge of tires. He's the fellow—driving over all sorts of roads—who really puts tires to the test. So we take special pride in the fact that so many thousands of farmers choose

Racine Country Road Tires

These Racine Tires are scientifically designed for country road service. They have 49% more side-wall strength, so ruts won't hurt them. They have the specially patterned tread, bridged up to the center. The "Country Road" is a rugged tire—built to stand hard knocks. And it's Extra Tested—all Racine Tires are. A special extra test protects each stage in manufacture. This extra care means extra wear when these tires go on your car.

Use Racine Tires and save money.

For your own protection be certain every Racine Tire you buy bears the name

the offering from the standpoint of individual excellence and richness of breeding will be such as few, if any, California sales have approached. From time to time detailed comment regarding the offering will be presented to our readers. In the meantime we would suggest that all California cattlemen, interested in Shorthorns, mark a ring around July 10 on their calendars and keep that date open.

Dimmick Gets Poland-Chinas from East

Dimmick Bros., Lemoore, breeders of Poland-Chinas, recently received a shipment of bred sows from the East. Included was a sow by The Yankee, bred to King Giant.

Weight Records in Basset's Herd

M. Bassett & Son, Hanford, who for years have been breeding Poland-Chinas, are paying particular attention to three young boars by Model Fellow. Careful record of their growth has been kept for the past four months. At three months of age they weighed, 90, 87½ and 83 pounds respectively; at four months 133, 131 and 121; at five months 179½, 175½ and 169½ and at six months 224, 219 and 217. One has been priced to go to South America. The other two will be kept, developed and shown at the leading fairs. Additions to the herd this spring are the sows Chief's Big Jumbo 2nd bred to Big Sensation, and Bobdale Edith by Luken's Big Bob, bred to Highlander. Recent sales are young boars to the following: Mrs. J. E. Knight, Willows; E. S. Remlinger, Orange; A. R. Grober, McFarland; John Develin, Napa and Geo. Glenn, Sanger.

Big Addition to Bernstein's Herd

John Bernstein, Poland-China breeder of Hanford, on his recent trip East made the following selections as additions to his herd: five gilts from the herd of Tom Hunter, Morrow, Ohio; four from J. D. Gerlaugh, Dayton, Ohio; one from J. O. St. John, Xenia; ten gilts, an aged sow and a young boar from Ed Frazier, Drexel, Missouri; a gilt from L. H. Glover, Grandview, Missouri; a sow from Earl Meharry, Talono, Illinois, and a young boar by The Yankee from Williams Bros., Villisca, Indiana.

McCunes are Busy

A young boar by Giant Buster from the herd of L. H. Glover, Grandview, Missouri, and three sows from Grover L. Sampson, St. Joseph, Missouri, bred to Suprise Prospect and King Jones have been added to the Poland-China herd of H. D. McCune, Lemoore. Mr. McCune's breeding herd now consists of 12 sows, 20 gilts and his herd boar King's Massive Orange. McCune's daughter Edith, and son Earle are also breeding Polands, each conducting their business independent of the other, doing their own buying, selling, feeding and developing. The progress made by his son, Mr. McCune states, was the cause of his entering the breeding business.

A Guaranty Sale Bargain

Princess Jonge Buckeye, a great young cow with two splendid yearly records to her credit, consigned to the Guaranty Sale at Sacramento, March 27, by Albert E. Smith, Sumas, Washington, was purchased for the modest sum of $1000 by Toyon Farm Association, Los Altos. She started working for her new owners immediately by dropping a beautiful heifer calf by Chimacum Spring Farm King Pontiac before she left the sale grounds. After reaching her new home she was put on official test and has made 30.60 pounds butter from 690 pounds milk during her best seven days to date, and is reported gaining.

Alba Sadie Cornucopia Creetia In creases Record

Alba Sadie Cornucopia Creetia, the great 34 pound cow owned by Anita M. Baldwin, Santa Anita Rancho, Santa Anita, recently completed the splendid record of 36.26 pounds butter in seven days. She also has a record above 800 pounds butter in 338 days to her credit after a previous freshening. She is the dam of Prince Walker Cornucopia, the highest record son of Prince Gelsche Walker, and this great youngster has already been bred to more than 60 of the best cows and heifers at Santa Anita Rancho.

A Sensational Jersey Offering

Buyers who are looking for the very tops in registered Jerseys will have an opportunity to satisfy their wants at the sale to be held at State Fair Grounds, Sacramento, on Tuesday, May 27, when the entire herd owned by Clifford F. Reid, Portland, Oregon, will be sold at auction under management of California Breeders' Sales and Pedigree Company. The sensation of the sale will of course be Goldie's Nehalem Beauty, the world's record cow who is the highest record Jersey ever sold at public auction. With Goldie in the sale will be her dam, two sisters, one daughter, two sons, 14 granddaughters and six grandsons. The balance of the herd is made up of choice Register of Merit cows, some of them imported, and the offspring of such cows. This herd is not only one of the greatest producing Jersey herds ever sold but is also one of the most outstanding herds of prize winners, as during recent years the herd has won more prizes than any other herd shown in the West.

A Coming Sale

The two Poland-China breeders, John Bernstein and W. L. Haag & Son of Hanford, announce that they will hold a public sale about the middle of September. In a previous issue of the Cultivator mention was made of recent additions to these two herds from some of the leading breeders of the Central West.

To Mr. Bernstein's herd have been added some 25 or 30 sows and gilts and as a running mate for his herd sire President he has selected a son of The Yankee from the herd of Williams Bros., Villisca, Ia. Mr. De Vore of the Duroc Bulletin on his recent visit to California made the statement that The Yankee was one of the leading Poland-China sires in the East.

To the herd of W. L. Haag & Son, better known as Lendorris Ranch, a herd which consists of about 20 sows and some 35 or 40 gilts, has been added a son of Liberty Bond to assist their present herd sire Young Jumbo. Liberty Bond, the sire of Lendorris Liberty Bond, is owned jointly by Moore Farm, Gardner, Kansas, and L. H. Glover, Grandview, Missouri, and in the midwinter sale of Glover sows bred to him and Liberator made an average of $823. Messrs. Bernstein and Haag state that the offering will consist of strictly big bone sows and gilts, bred to the above boars, and that they believe it will be of sufficient quality to attract buyers from all parts of the Pacific Coast.

Poland-Chinas to Sell in October

M. Bassett, Hanford, who was one of the first Poland-China breeders in the state, is planning now for his public sale which he announces will take place along about the 7th or 8th of October. The sale will consist of 40 to 50 head of sows bred to one of the various herd boars now maintained on the ranch.

Tulare County Poland-China Breeders to Organize

Wednesday night, April 30, the Poland-China breeders of Tulare County met in Tulare to perfect an organization and discuss plans for holding one or more public sales the coming fall.

FRUIT CROP REPORT

Continued from Page 621

drop has been very heavy, not over 70 per cent of the normal crop left. Prices ought to be good since 'cots will have a world market this fall. The Cultivator is doing a good service in getting out these reports.

H. C. Dunlap, Organization Department, California Prune and Apricot Growers Inc.

Can say generally that apricot crop is excellent to date, both in the southern San Joaquin and Southern California districts. There is certainly a large percentage of damage through Bay districts, beginning as far south as Monterey and Santa Cruz Counties where the damage is possibly greater than 50 to 25 per cent and upwards damage in San Benito County, something similar to Santa Clara County. Damage becoming greater every day owing to twig blight condition in Alameda County. Crop in lower portions there in great jeopardy, being rather near a total loss, damage to the orchards resulting from blight condition. Crops farther north, Solano County consideraly damaged, Yolo County excellent apricot prospects.

For prunes would report all districts of the state, excellent prospects at the present time. Rather early for the best estimate of crop. Prune crop will be determined by the weather between this and late in June. A very hot spell and north wind would have a disastrous effect. Conditions behind the present crop prospect in prunes excellent. Last year's early fall rain and the adequate winter's rainfall give us hope of a bumper. Would not try to estimate it at this date in tons or percentage of a crop.

The packers dealing in the small portion of fruit remaining without the association have paid from 14 to 20 cents per pound for apricots; have also paid from 8 to 11 cents basis for prunes. These prices most certainly speculative in a measure. Association prices will not be named until such time as crops can be more positively estimated.

A. L. Rutherford, Horticultural Commissioner, Stanislaus County

Almonds, 100 per cent; apricots, 100; cherries, 100; peaches, 80; prunes, 100.

Sheridan W. Baker, Santa Rosa, Sonoma County

Apples, prospects to this date for splendid crop; apricots, light crop, not produced commercially; cherries, fine prospect for good crop; peaches, good, not many produced; pears, favorable for good crop; prunes, too early to estimate percentage, but looks good for fine crop.

Wm. Gould, Horticultural Commissioner, Yolo County

Almonds, 75 per cent; apples, 100; apricots, 90; cherries, 80; peaches, 100; pears, 100; prunes, 75.

F. W. Waite, Horticultural Commissioner, Imperial County

Apricots, 115 per cent; pears, 100; almonds, apples and others not grown commercially.

Chico Cured Fruit Association, Butte County

Almonds, 75 per cent; cherries, 100; peaches, 100; prunes, 100.

Niles Cannery, Alameda County

Apricots will be light—have die back; tomatoes, over planted, but outlook is for $10 or $12 per ton, much lower than last year. Cherries promise large. Almonds light. Rains came at wrong time.

Thos. P. Redmayne, Horticultural Commissioner, Marin County

Almonds and cherries are not grown much commercially in this county but the outlook for both is above the average. Apples are apparently 100 per cent. Apricots are badly affected this year with the brown rot fungus and in all probability will be about 40 per cent. Peach curl is giving some trouble and will no doubt affect the yield. At this stage the outlook is for 90 per cent of a peach crop. Pears and prunes indicate a full crop, the latter especially looking well. I would place both these at present at 100 per cent. The rainfall to date is 36.97 inches and the weather somewhat cool.

Geo. C. Nevins, Hemet, Riverside County

Hemet is congratulating herself on a present prospect of having the largest crop of apricots and peaches ever. The older apricot orchards are all promising 100 per cent yield, and the many young orchards coming on, all with big crops, make the outlook good for the largest tonnage we have ever had, which is now estimated at 16,000 tons. All peach orchards now look good for a full crop.

Buyers are already offering 19 cents per pound for dry and $50 and $52 per ton for green 'cots, and from $40 to $55 per ton for peaches. Other fruits which we have in small quantities only are looking well.

Mrs. Clara K. Graham, Ramona, San Diego County

Rains of March thinned apricots just right. Will be compelled to thin peaches. All fruits give promise of fine crop.

Fred K. Howard, Horticultural Commissioner, Kings County

All crops looking fine at this time. Apricots, peaches, prunes, normal or better.

Geo. W. Harney, Horticultural Commissioner, Yuba County

Almonds, 50 per cent; apples, 100; apricots, 40; cherries, 70; peaches, 90; pears, 110; prunes, 100. This date, April 25, looks as if Bartlett pear is leading deciduous fruit as to quantity and quality. Will have splendid crop 1919 from present indications.

F. C. Brosius, Horticultural Commissioner Sacramento County

Almonds, 90 per cent; apricots, 95; cherries, 100; peaches, 105; pears, 110; prunes, 100.

J. W. Mills, Farm Adviser Solano County

Almonds spotted, Dixon 50 to 80 per cent; Suisun, 15 per cent of crop; apricots, 75; cherries, early varieties, 60; late, 80; peaches, 100; pears, 100; prunes, too early to estimate, they do not seem to grow.

D. D. Sharp, Horticultural Commissioner, Riverside County

All tree fruits, practically 100 per cent; crop is late.

C. H. Flournoy, Horticultural Commissioner, Tehama County

All fruits mentioned, 100 per cent of normal crop. In addition, lemons, oranges and figs at this writing are showing full crops. Especially is this true as to first crop figs. I have never known the second, or main, crop to fail. Oranges and lemons now in full bloom.

The figures given are estimated from the condition of orchards that have been well cultivated and properly pruned. Some of the older orchards that have been neglected will not produce more than 50 per cent crop, while everything indicated 100 per cent crop on trees well cared for. What might happen to change the percentage later in the season no one can tell, but if you desire I can let you know from time to time how the different fruits are doing in this section. (Fine. We trust other readers will make later observations and report from all portions of the country.)

Other reports next week.

SCHOLARSHIPS RESULT FROM CLUB WORK

The legislature of Oklahoma has just passed a law creating two scholarships at the Oklahoma Agricultural College for each county in the state. The bill as originally drafted provided that applicants for scholarships must be members of boys' and girls' clubs in agricultural extension work. This provision was later eliminated. The examination for applicants, however, is such that only those who have received a training in agriculture equivalent to that given in the cooperative club work can hope to pass.

The scholarships are available to both young men and young women without discrimination as to subjects. That is, girls are not required to take an examination in domestic science, but may be examined in agriculture, as many of them very likely will. For scholarships heretofore given by bankers and others in Oklahoma, girls have won over the young men applicants in agricultural examinations.

With the Return of
Peace and Prosperity
Plant
Teague Quality
Citrus Trees

With the present demand for food stuffs, the return of peace and normal economic conditions there will be a growing demand for all orchard crops and a corresponding larger demand for nursery trees. Already this return is finding expression in an increased demand for Teague Quality Citrus trees, which leads us to advise intending planters to book their orders early, as the available supply of really good, bud-selected (pedigreed) trees is rather limited. For this reason we invite correspondence. Prices cheerfully furnished.

The Dealers's Obligation

By Butler-Veitch Company

RIGHT here is the biggest problem the tractor dealer has to face—tractor education, first for himself, then for his owners. Advertising, tractor schools and tractor demonstrations have done and are doing much for both dealers and owners, but when all is said and done, the specific concrete facts must be imparted by the dealer, and to do so in fairness to himself and the tractor industry, he must know tractors and his tractor in particular.

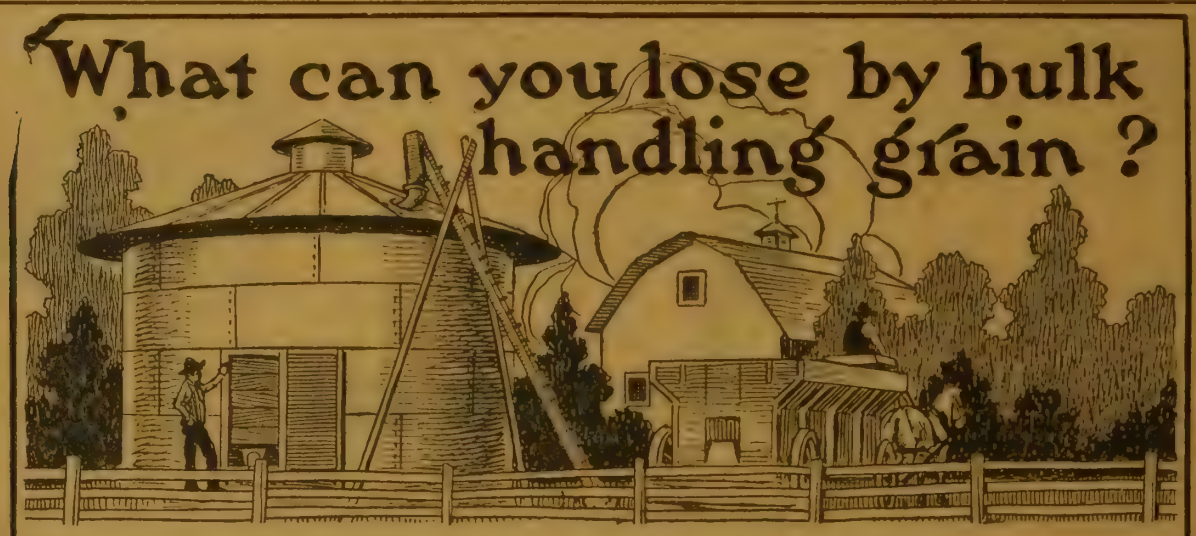
Perhaps it is unfortunate that a tractor has an internal combustion motor and smells like an automobile, for it has undoubtedly given many dealers and owners the impression that it is sort of a half brother to the automobile, a device without rubber tires and rather slower.

Those of us who have tried to take to the air in an automobile, know it won't work, and next season when we put in our first stock of aeroplanes we won't sell and service them on an automobile basis. Years ago manufacturers tried to put the automobile in the field and found it would not work, so they built something just as different in its way as an aeroplane and called it a tractor, and yet some of us still sell tractors on an automobile basis.

How can we expect the owners to realize the difference if we don't see it ourselves?

Suppose an owner comes to you after using his tractor 90 days and makes the startling statement that his motor needs an overhaul and to all appearances is in much worse shape than his two year old automobile which has never had any motor trouble. Are you going to be able to show him that his tractor motor has travelled more than twice as far in 90 days time as his automobile traveled in two years, that his oil should have been changed 20 times, and that his valves should have been ground at least three times, or are you going to let him continue to measure his tractor in time and not work done, and continue to sell and service your tractor on an automobile basis? That is only one point of the many that the dealer must absorb and then pass on to the owners.

The tractor is different, and dealer and owner must realize it. It is not going to last as long in time as an automobile, it is going to need repairs more often. The work the tractor has to do is not variable—always its job is going to be hard and no better roads movement or anything else will lighten its load—except the dealer educated owners.



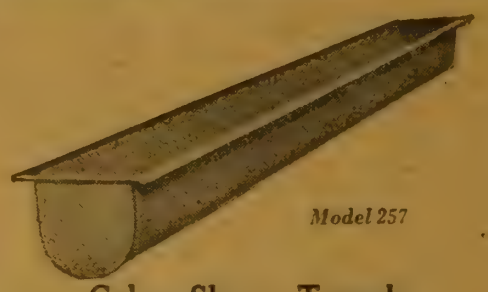
It is generally accepted that the tractor has now fought its own way and needs no champion. Perhaps as a whole the tractor industry does not, but the time will never come when each individual tractor will not need a champion to help it fight its own battle.

Then in selling the tractor let us remember that we are not merely selling a machine; we must sell as well tractor limitations; what it will do and what it will not; what wears out first and how to fix it; how to make it run when it has stopped, and how to stop it when it continues to run (through a fence).

And just as soon as the owner realizes that part of the obligation is on his shoulders and not all on the tractor, then the tractor will have the chance it deserves.

So let's get a lot of reliable information at the Sacramento show, take it home with us and start our own little tractor schools. It's going to pay to help owners help the tractor help itself.

Commissioner of Internal Revenue Roper says that no grapes can be used in wine making after May 1 even by private consumers.



YOU know what you can save by handling your grain in bulk, with the Calco Grain Bin.

What can you lose? Careful investigation proves that the only loss would come from carelessness.

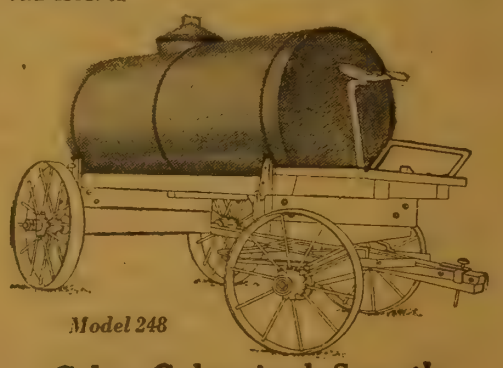
And no practical grain grower would permit loss from such a source.

Changing from sacks to bulk, and putting in the Calco equipment, cannot be considered a loss—it's an investment that starts paying dividends at once, like a savings account.

Write for the free booklet, "Calco Grain Bins"

Model 257

Calco Sheep Trough



Low, water-tight trough, without rough edges or disease catching cracks. Readily fitted on wooden supporting frame. Capacities from 51 to 131 gallons. Ask about it.

Model 200

Calco Stock Watering Trough

Built ready to be placed on supporting frame; light, easily moved when desired, sturdy and durable. Armco Iron used in construction. For cattle or horses. Write for price list with sizes.

Model 248

Calco Galvanized Smooth Iron Tank

Built of heavy Armco Iron, riveted, soldered and substantially made. Braced inside with baffle plate, preventing wash of contents from end to end. Capacities from 263 to 805 gallons. Write for Calco Wagon Tank circular.

CALCO GRAIN BINS

TRACTORS IN 1919

A production of 314,936 tractors in the United States in 1919 is estimated by manufacturers reporting to the office of farm equipment control, United States department of agriculture. The reports obtained in a special inquiry by the department show a production of 132,697 tractors in 1918. The manufacturers gave the number of tractors of different sizes manufactured last year and estimates of the number of each size that will be made this year. The figures for 1919, of course, are merely estimates and represent the aggregate of the estimates submitted by the tractor manufacturers in January and February of this year. A summary of these reports follows:

Number on hand December 31, 1917, 15,525; manufactured during 1918, 132,697; sold in the United States during 1918, 96,470; sold for export during 1918, 36,351; on hand December 31, 1918, 15,401. Manufacturers' estimate of production for 1919, 314,936.

Number of tractors which manufacturers estimate they will produce in 1919 at makers' rating belt horse power: 9, 10 and 12, 8220; 16 and 18, 48,545 ; 20 and 22, 157,671; 24 and 25. 40,875; 27, 28, 30 and 32, 27,465. 35 and 36, 5435; 40, 45 and 50, 1780; 60, 65, 70, 75 and 80, 1536; not given, 23,409.

FARM LOANS

During the month of February, 1919, $14,799,788 were loaned to 4209 farmers of the United States by the federal land banks on long time first mortgages according to the monthly statement of the farm loan board. The federal land bank of Omaha leads in amount of loans closed, $3,895,400, with the federal land bank of St. Louis running second in amount, $2,055,955. The other banks closed loans in February as follows: Houston, $1,863,213; St. Paul, $1,506,600; Spokane, $1,251,720; Wichita, $1,019,800; Louisville, $757,300; New Orleans, $735,800; Columbia, $505,500; Berkeley, $473,800; Baltimore, $386,900; Springfield, $347,800.

On March 1 the total amount of mortgage loans closed since the establishment of the federal land banks was $182,897,964, numbering 75,384 borrowers. During February 5990 applications were received asking for $23,720,593. During the same period 4879 loans were approved, amounting to $20,137,009. Altogether 179,734 have applied for loans under this system, aggregating $471,455,362.

GARDEN GUIDE

The most striking feature in Theodore Payne's 1919 Garden Guide is made of facts regarding the new Victory tomato. Mr. Payne characterizes it as the most perfect tomato ever grown. It is a cross between the Stone and the Livingston, almost perfectly round, medium size, and when fully ripe, a deep rich ed. Its flavor is perfect, containing a high percentage of sugar. We saw this tomato at harvesting time last year and it certainly is a wonderful addition to California gardens.

GRANGE ROSTER

The California State Grange Patrons of Husbandry has issued a most valuable roster to all subordinate members, which gives a list of the officers of the national grange, of the California state grange with its various executive and other committees, and a list of the Pomona and subordinate granges together with their officers.

PUTTING IT PRETTILY

A great big soldier boy had picked a little bit of a girl. When a fellow "joshed" him a bit, he said: "Yes, Bill, she would have been taller, but she's made of stuff so choice and fine and scarce that the Lord just naturally couldn't find enough of it here to make her any bigger."

UNCLE EBEN

"I's willin' to love my fellowmen," said Uncle Eben; "but I can't git up no mo' ambition to 'sociate wif some of 'em dan a rabbit has foh makin' up to a houn' dog."

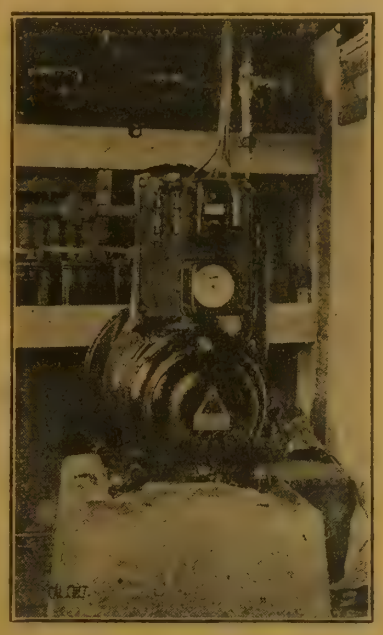
Household Department

NATURE

Nature never did betray
The heart that loved her; 'tis her privilege,
Through all the years of this our life, to lead
From joy to joy; for she can so inform
The mind that is within us, so impress
With quietness and beauty, and so feed
With lofty thoughts, that neither evil tongues,
Rash judgments, nor the sneers of selfish men,
Nor greetings where no kindness is, nor all
The dreary intercourse of daily life
Shall e'er prevail against us, or disturb
Our cheerful faith, that all which we behold
If full of blessings. Therefore let the moon
Shine on thee in thy solitary walk;
And let the misty mountain winds be free
To blow against thee; and in after years,
When these wild ecstasies shall be matured
Into a sober pleasure, when thy mind
Shall be a mansion for all lovely forms,
Thy memory be as a dwelling-place
For all sweet sounds and harmonies;
O, then,
If solitude, or fear, or pain, or grief,
Should be thy portion, with what healing thoughts
Of tender joy will thou remember me.
—William Wordsworth.

THE PASSING OF THE WICK

By James De Camp



IN THE inelegant but forceful language of the day Ben Franklin "sure started something" with his little kite and key experiment back in 1752. At that time there were many who thought him mentally deranged when he spoke of snatching from the heavens that crackling celestial flame that raged during thunderstorms.

But even the brilliant and far-seeing author of "Poor Richard's Almanac" would have doubted the sanity of a person predicting that within a scant century and a half this destructive dynamic would be the harnessed bond-servant of man, imprisoned in the great powerhouses of the cities to serve at his beck and call and easing the burdens of hundreds of thousands of country homes through the medium of individual generating plants.

These are days of feverish progress. Hardly a score of months ago the farmer was doing his early morning and late evening chores by the flickering light of a smelly lantern and attempting to enjoy his fireside reading while manipulating a smoky and unsatisfactory oil lamp. Now, Aladdin-like, he touches a tiny button, and sitting room, stables, basement or whatever portion of the premises he desires, are flooded with the brilliant, penetrating rays of incandescence.

Local lighting and power plants for those remote from the large distributing systems have passed the experimental stage and are now a reliable reality, an actual necessity for those who would keep pace with the times and wring maximum results from hours and effort expended. In fact recent investigations have disclosed that a dependable plant is not only a desirable convenience but an income bearing investment for the enterprising agriculturist.

Thrusting aside for the present the dollars and cents viewpoint, one of the paramount beneficial effects of having electricity on the farm or ranch is the cheery, wholesome atmosphere created by brilliantly lighted rooms. It is thought that many young people have left the farm for the city's turmoil because of the long, dreary, lamplit evenings with their discouraging semi-darkness. The electric plant gives everyone adequate light to read by and dispels the air of gloomy depression that lurks about a lamplit house. It encourages social gatherings, study, or practice upon an avocation and fosters the spirit of relaxation that is invaluable to those who spend the day at stiff outdoor labor.

Light Up the Home

Equipment for generating electricity for lights has been perfected until it is now possible for every home, even in most isolated sections, to be equipped with modern lights and with power to lighten household work.

But the domestic aspect of the farm electric plant is far from limited to lighting alone. The time saving comforts and conveniences that may be made use of through the medium of electric power are almost too numerous to catalogue. At slight expense this stored up energy may be set to pumping water to the various parts

Ready for the Churning

Home generated electricity gives up its power with greatest convenience to run the churn, the electric fan, the washing machine, the sewing machine, and various other modern home conveniences. The motor is light and easily transported from room to room.

Keen Judges of Motor Car Value Select the

GRANT SIX

The Grant Six has never asked odds of anybody on either quality or price. It has always been in the lead. It is today.

Thus at the big shows where all cars are exhibited it is not astonishing that the Grant Six proved the most popular car of its type.

Ever since the first Grant Six—the original genuinely light six—was built, the capacity of our factory has been tested each season. The demand has always exceeded the visible supply. This season will prove no exception. For in quality and in price the Grant Six is easily the leader.

It is superior in power, in size, in quality, in ease of riding, in durability and in economy of operating cost. It is an exceptionally stylish car, therefore it is not surprising that the Grant Six is the choice of keen judges of motor car value.

Owners average better than 20 miles to the gallon of gas, 900 miles to the gallon of oil, 7000 miles to the set of tires.

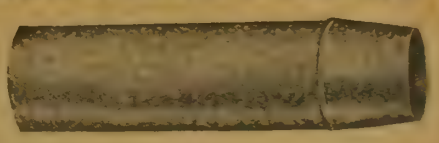
Considering thrift and considering comfort and considering value you will certainly be wise to purchase a Grant Six.

This is not the time for idle words. We offer just one suggestion—see the Grant Six dealer as quickly as you can and place your order.

Select from these five body styles

Five-Passenger Touring Car $1120—Roadster $1120—Coupe $1625
All-Weather Sedan $1645—Demountable Sedan $1400
All prices F. O. B. Cleveland

GRANT TRUCKS



1800 lbs., 1½ tons, 2 tons, 3½ tons capacity, are all electrically started and lighted and completely equipped. So reasonably priced that you will find they offer a bigger return for every dollar invested than any other trucks.

Poultry for Profit

Read what Portland Oregonian has to say about this book and its author.
There is a woman down in California who knows more about poultry than all the men in the state, and this, too, for that matter. Her name is Jean A. Koethen, and she has written a book which is published by the California Cultivator of Los Angeles, and called "Poultry for Profit." It costs a dollar, postpaid, and it ought to be in the hands of every one who is keeping hens. This paper has reprinted a lot of matter written by Mrs. Koethen and, because of its quality, her book is recommended. Climatic conditions in these states are so nearly alike that what is good or bad for fowls there is the same here. The price of three dozen eggs will get the volume and its purchase is a good investment.—Portland Oregonian.

Send in $1.00 for book or $1.75 for book and California Cultivator.
Cultivator Publishing Co., 115 N. Bdwy., Los Angeles

When writing advertisers, mention The Cultivator.

of the dwelling, eliminating the back breaking drudgery of hand pumping and water carrying and making possible an indoor toilet and bath with running water. Then there are the other comforts of city life which become available, such as the washing machine, vacuum cleaner, electric iron, fan, toaster, percolator, vibrator and a magician's hatful of labor and worry savers.

However valuable the service given the home by the electric unit it is in the field of the farm or ranch work itself that this equipment proves in dispensable to even the most miserly of masters. It makes possible the use of every daylight hour for field work, providing electric light for the necessary inside labor such as feeding the stock or overhauling the tractor. By providing better light it reduces the time needed for doing the chores nearly one-half, eliminating all poking about in dark corners to locate this and that. A clear saving is made of all the time previously required to clean, clip and fill the lanterns and lamps.

But this tireless Man Friday will also lend a hand when it comes to operating the grindstone, fanning mill, milking machine, rotary saw and a score of other devices. Small portable electric motors provided with a pulley wheel and extension arm have been perfected to supplant "elbow grease" in these tiring tasks. These motors can be purchased complete for from $50 to $60 and are capable of doing everything from winding the clock to clipping the coat of the old bay mare.

One of the most potent arguments in favor of electric lighting for the farm is the minimizing of fire risk. Electric lights are far safer than the open flame kerosene light. America's annual fire loss is said to be in the neighborhood of $262,000,000. Too great a portion of this consists of farm buildings, live stock and food stuffs. In addition to furnishing a safer light the electric plant will operate a pumping system with pressure sufficient to force a stream of water over any of the buildings.

Then when valuable stock gets into trouble after night relief can be supplied in the minimum amount of time and without the delay of hunting and lighting a lantern.

The makers of the Delco-Light plant, a generating unit now in use in more than 70,000 farm homes, recently compiled from figures furnished by a number of users of their product a table showing the average saving effected by electricity each week. Each report considered was sworn to before a notary. The statistics follow, time saved being valued at 30 cents per hour:

	Hours.	Value.
Cleaning and trim'ng lamps	3	$ .90
Operating separator	1	.30
Running washing machine	3	.90
Running grindstone	½	.15
Electric iron	1	.30
Pumping water	5	1.50
Operating fanning mill	½	.15
Totals per week	14	$4.20

This average weekly saving amounts to $218.40 per year. Considering that the average cost of a farm generating plant is in the neighborhood of $500 and the operating expenses are almost negligible even Shylock would admit that he was getting pretty fair interest on his investment without taking account of the modern comforts and conveniences furnished on the side.

Unlike the earlier type of plant, which supplied light only while a gas engine was running, the later creations store "juice" in a flock of especially designed batteries, the number of these varying according to the amount of current demanded. It is necessary to run the motor and generator about once each week, the motor operating on gas, gasoline or kerosene at an average cost of two cents the kilowatt hour or from 75 cents to $1.50 the month. Electricity is available at all hours of day or night, the cells storing up an abundant reserve supply.

Several of the most popular generating units are so compact that, without the batteries, they would almost fit into a trunk of average size. A space saving practice is that of mounting the generator and fly wheel of the small stationary motor on opposing ends of the same shaft. Equally as valuable is a trip arrangement which automatically stops the engine by breaking the ignition circuit when the batteries have been charged to capacity.

An investigation conducted recently by the research department of The Michigan Farmer reveals some interesting facts concerning the experiences of 30 users of various makes of light plants. The figures compiled show an average monthly operating expense of $1.48 for the 30 plants, each working under varying conditions. The farmers on this list had installed a total of 1099 light sockets or an average of 38 sockets apiece, the size of their places ranging from 360 to two and a half acres.

The symposium showed that the majority had installed 16 cell plants, which had been in operation for periods varying from six years to one month. Three reported "some trouble" while the remaining 27 replied negatively to this question. Without exception all the answers stated that the owners of the plants were well pleased and recommended electric systems to all farmers as time and labor

Modern California Home
Amongst other modern appliances in this home is an electric light generator, which, with telephone and other advantages, adds to comforts and luxuries.

SOUTHERN GINGERBREAD

One cup of molasses, one-half cup butter or one-quarter cup lard and one-quarter cup butter, one teaspoon powdered ginger, one-half teaspoon powdered cloves, two teaspoons powdered cinnamon, one-half teaspoon powdered allspice, two teaspoons baking soda, three cups flour, two eggs, one cup boiling water, one teaspoon baking powder. All measurements level. Method: Beat the butter and sugar to a cream, stir in spices, beat thoroughly. Then add the molasses and the hot water, to which the soda has been added. Add the flour and the baking powder and lastly the well beaten eggs. Turn into a greased and floured tin and bake in a moderate oven until it shrinks from the sides of the pan. Divide the gingerbread into blocks while warm and serve with a whipped cream dressing.

TOO GOOD TO WASTE ON POETRY

A western poet refers to a mole on a pretty woman's face as a "tear drop petrified by its own audacity." Any man with an imagination like that ought to give up poetry and peddle ice.

The Cultivator Patterns

8939—Girls' One Piece Dress. Cut in sizes 6, 8, 10, 12 and 14 years. The dress is to be slipped on over the head, and the only fastening is the lacing where the dress is slashed at center front.

8966—Ladies' Waist. Cut in sizes 36, 38, 40 and 42 inches bust measure. The collar ends are long and faced with the satin.

8958—Girls' Dress. Cut in sizes 6, 8, 10, 12 and 14 years. The waist closes at the center front and the one piece skirt is gathered all around.

8953—Ladies' Semi Fitted Dress. Cut in sizes 36, 38, 40, 42 and 44 inches bust measure. A severely plain vest forms the becoming square neck.

8929—Ladies' Apron. Cut in sizes 36, 40 and 44 inches bust measure. The apron has a three-gored skirt gathered to the bib section.

8951 — Girls' Four Gored Petticoat. Cut in sizes 6, 8, 10, 12 and 14 years. The petticoat may be finished with a plain hem or with a straight gathered ruffle of embroidery.

8940—Ladies' Two Gored Skirt. Cut in sizes 24, 26, 28, 30, 32 and 34 inches waist measure. The back gore is cut so that it extends over the hips to the front gore.

PRICE OF ANY OF THE ABOVE PATTERNS 10 CENTS EACH.

HOW TO ORDER PATTERNS

Write your name and address plainly in full, give correct number and size of each pattern you want, and send 10 cents in coin or (1 or 2 cent) stamps for each number. In order to furnish our readers with the very latest New York City styles, all pattern orders are filled in New York City. Therefore, we promise to deliver all patterns ordered within two weeks; we guarantee safe delivery of all patterns. Address

THE SINGLETON OAKS

(Concluded from last week)

The girl leaned forward eagerly. "We had been driving through a level, dreary country, when we suddenly ran into an enchanted spot. On both sides of the road grew great wonderful oaks that met overhead. I just made Fred slow down. Then I saw across the fields the old mansion with its white columns and the other houses grouped around. I remembered your description of your home, and I told Fred I believed that was the very place!"

"You haven't said anything about father yet," Arthur said.

"Oh, that's the best of all! Your father and an old negro, both bareheaded, were walking under the trees. They did not hear us coming. Now and then they stopped and looked up at the trees like children, and your father pointed out something with his cane. In the afternoon sunlight the whole scene was magical."

"She's full of sentiment," said Fred, laughing. But Arthur was wondering whether, after all, sentiment was not one of the best things in the world.

"The both bowed low as we passed," Mary went on. "When I looked back they had continued their walk. You know I had a strange feeling. I felt that the old gentleman and his servant were in some sort of trouble, and that I should like to serve them."

There was another burst of laughter from Fred. The waiter was coming toward them at last balancing his tray; but Arthur, rising suddenly, glanced at his watch.

"Perhaps you have served them," he said gently to Mary. "I hate to break away like this, but I've got to go home, and I have only ten minutes to catch the train."

"Oh!" cried Mary. There was nothing the matter, really there wasn't Your father looked well and ruddy. I didn't mean—"

"I know," Arthur replied, with a smile. "There is nothing serious. I just feel that I ought to go. This train is the last chance until tomorrow afternoon."

"Now, what's all this?" demanded Fred, rising with his napkin in his hand. "Mary you have played thunder with the delicate feelings of our one-time all-star tackle. Are you really going, Arthur? Well, it looks like a case of temporary insanity, but I'll take you to the station in the car. I'll be back in ten minutes, Mary."

Arthur shook hands with Mary, and the two young men hurried out of the dining room and to the garage. Then Fred drove swiftly to the station; the two jumped out and ran through the waiting room to the shed. The train was pulling out. The gates were closed.

Fred put his hand on Arthur's shoulder. "Nothing serious, old man, is it?"

"Oh, no," replied Arthur.

"Taken this way often?"

"No—not often enough."

They went back and had their supper. Then all three took a walk through the city. When they said good night in the lobby at the hotel, Mary came close to Arthur.

"What was the matter?" she asked, with a serious look on her face.

For a moment Arthur was on the point of telling her about the trees, and then he said, "Why, I just thought of something that I ought to attend to—nothing serious."

Arthur crawled wearily into bed, but he could not sleep. Now that the sounds of the street were silent the picture of old Hank and his father taking their last walk under the trees became more and more vivid in his mind. He went over again and again his conversation with his father that morning. He knew that he had overemphasized the importance of meeting the note—that he could renew the note without much hurting his credit.

His father's words about the agreement recurred to him. Had he not overstepped the bonds of a gentlemen's agreement in insisting that the trees that his father loved be cut? The trees themselves seemed to rise before his eyes in long, stately lines—giants that had battled a hundred tempests. He could see them prostrate now, with only the ugly stumps to mock the spot they had blessed.

Midnight struck—one o'clock—two o'clock. In four hours the destruction would begin. Through his window he could see the moon, shining bright. Was his father looking at the oaks now in the moonlight for the last time?

Springing out of bed, Arthur Singleton turned on the light and dressed. He hurried down the silent hall to Fred's room. He knocked on the door until at last Fred, frowzy-haired and blinking, opened it. Fred looked at his friend with unfeigned astonishment.

"Another fit?" he asked.

"Fred," said Arthur, "I am going to ask a favor of you. Will you take *me* home?"

"When?"

"Now."

"What for?"

"I must go, Fred, I must."

"Arthur Singleton," said Fred seriously, "you used to be a sensible fellow, or at least I thought so; but if you aren't acting like a crazy person now, I'm crazy myself. I don't understand you, but I'm game. I'll take you."

Fred began to dress.

"Now," he continued, when he had put on his coat, "I'll tell Mary. If she wakes up and finds I'm not here, she'll be worried."

He was gone for some time, and when he returned he said, "Mary insists on going, too; she'll be along in a minute. It's catching, Arthur, this complaint of yours. I feel it coming on myself."

Day was breaking when they came in sight of the oaks. Arthur had told Mary and Fred why he wanted to get home, and Fred, although he had laughed, had driven like a madman. Up the driveway they sped to the big porch. Hank came around to meet them.

"Where is father?" Arthur demanded eagerly, as he climbed out of the car.

"He riz early, suh," replied the old negro coldly. "He walked off dat way." Hank pointed in the direction opposite the oaks.

"He couldn't stand to see them cut." said Mary softly to Arthur, and her eyes were bright with happiness. "Oh, he'll be so happy now!"

"It's cold and damp for him to be out," Arthur said to Hank.

"Me and Mandy done wropped him up, suh," the old negro replied. "Me and Mandy been a-lookin' arter him for twenty year, suh."

"The trees are not be cut, Hank," said Arthur. "Tell the boys to go on with the ploughing."

"What dat, Marse Arthur?" cried Hank. "What dat I hear you say, suh? De trees, de trees!" His face was trembling with joy.

"They are not to be cut down."

"Mandy, Mandy, whar are you ol' woman? Is you deef?"

Hank hobbled toward the kitchen.

Arthur turned to his friends. "I think I know where father's gone. There's an old negro in a cabin in those woods. He went through the war with father."

"We'll follow!" cried Mary., And the three started by a path across the fields.

The sun had risen bright when they reached the cabin. Major Singleton heard their steps and came out to meet them.

"Father," Arthur drew himself up like a soldier making his report, "I came home to save the Singleton oaks."

The major glanced quickly at the faces around him. "But how about the note?" he asked.

"I exaggerated the importance of meeting the note now," he said. "We can renew it, of course. I wanted to have my own way, sir." Arthur turned to Mary. "She changed my mind, sir. This is Mary Graham. You have heard all about the Grahams."

As Major Singleton bared his head. the sun glistened on his silvery hair. He took the girl's hand and looked into her eyes.

"My dear young woman," he said, "if Arthur had not changed his purpose in your presence, he would not have been a son of mine."

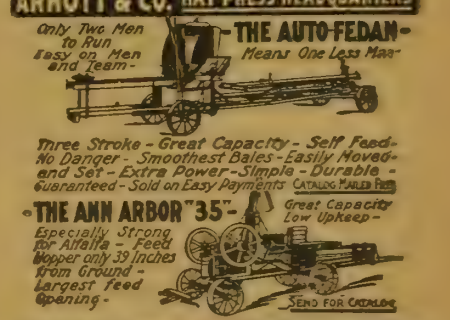
Arthur took a deep breath of the morning air. The tears were not far from his eyes. For as he looked at the old gentleman and the young woman, he knew that something of his father's sentiment lived in his own heart ,and he thanked God for the heritage.

But Put it on an Auto-Wheel and away you go!

A wheel barrow is a clumsy, heavy thing at best and when loaded, you know how hard it is to push.

But, think of the hauling you could do with an Auto Wheels and the fun you could have coasting and racing!

Every boy on the farm, as well as the city fellow should own an Auto Wheel Coaster or an Auto-Wheel Convertible Roadster. The Auto-Wheel is built for strength and speed. You can't overload it and you can't beat its speed limit. Wheels have roller bearings, steel axles, oval spokes and steel tires. The Auto-Wheel is the ideal wagon for work or play—it is the wagon you ought to have.



SEND FOR FREE FELT PENNANT

Wouldn't you like a beautiful Felt Pennant FREE? Send us the names of three coaster wagon dealers and we'll send you a Free Felt Pennant and full particulars regarding the Auto-Wheel Coaster and the Auto-Wheel Convertible Roadster. We'll also tell you how to organize a Coaster Club. Write today

More About Raising Chicks

By Jean A. Koethen

"PLEASE give me the name of some good buttermilk preparation," writes a Concord subscriber, "and how much to use to make, say, a quart of liquid. Can the buttermilk be mixed dry in a dry mash? In buying rolled oats for my chicks should I buy the bulk rolled oats that I use on my table? What do you think of the commercial chick feed put up by the different milling companies? At what age would you begin feeding sprouted oats? Are oats so much better than barley, and why? I suppose the grain should be scattered in dry alfalfa hay. I have plenty of the green. I have a brooder that is supposed to care for 200 chicks, so I suppose the 100 I have ordered will be about the right number. Will you kindly tell me how to regulate heat as to age of chicks? My little brooder is heated by a coal oil lamp."

There are a number of good buttermilk and skim milk preparations on the market. One of these is dried buttermilk. Another is semi-solid buttermilk which is to be diluted with water in the proportion of one pound of buttermilk to one and one-half gallons of water. A third is Lactein, which is, I believe, a skim milk preparation. Both dried buttermilk and Lactein are made in California. You can buy a buttermilk mash containing dried buttermilk or you can buy the dried buttermilk and mix your own mash, making the buttermilk about 10 per cent of the whole. A fancier whose formulas were recently quoted in the Cultivator uses 10 per cent dried buttermilk and five per cent beef scrap in his chick mash and moistens the whole with semi-solid buttermilk in the above proportion. This is a rich mash but has given excellent results.

The rolled oats used by nearly all chick specialists are the same we use on the table. They are expensive feed for chicks, but worth while for a short time. I have had excellent results with the buttermilk mash by adding a handful or so of rolled oats—the proportion does not matter. You could make it half oats if you wished, but from 15 to 25 per cent is probably sufficient. You can scatter the rolled oats dry on the sand at first and after three days add them to whatever mash you use, wet or dry.

So far as I know there is not much difference between different brands of commercial chick feed. They are all too fine to use long. I like to mix a little coarser grain, milo, cracked corn or wheat, with the chick feed from the start. It is astonishing how soon the chicks will begin to eat the larger grains and how short a time it will be till they prefer them to the chick feed. By all means feed the grain in green alfalfa, cut fine. Scatter the alfalfa over the sand on the floor of the brooder and throw the grain into it. The chicks will soon be eating alfalfa as well as grain.

I would feed sprouted oats as soon as the chicks will eat them, which is perhaps about the age of two weeks. The only reason oats are better than barley is that they contain more material for building frame and growing feathers. Sprouted barley is very good for chicks.

The only way to regulate the heat in a small brooder is to watch the chicks. If they are comfortable they will lie quietly, on the floor of the brooder, either under the hover or just at its edge. If they peep or huddle or seem uncomfortable give them more heat. The heat for a new brood is usually started at from 90 to 95 degrees, but can be dropped quite rapidly at this season. After the first week they will need little heat, if any, during the day, but after 4 o'clock and in the early morning, as well as through the night, the lamp should be lighted and sufficient heat allowed to make the chicks perfectly comfortable. A good deal depends on the amount of sunshine on the brooder and the shelter it has from the wind. One hundred chicks in a sunny sheltered place need little artificial heat after the first week.

Another subscriber, a Los Angeles woman, writes: "Two years ago I bought 150 day old White Leghorn chicks in May. They received no care after they were three months old. half a bucket of barley twice a day, no mash of any kind. When they were eight months old they began laying. I gave them a commercial laying mash then and they did very well.

"This year I am feeding my chicks steamed barley, which is more palatable and more economical than dry, and a mash composed of cocoanut meal mixed with all the water it will take up, sure-milk, beef scrap, fish meal and charcoal; they have grit, charcoal and shell before them all the time and ten acres to roam over for greens and bugs. Now, if my pullets had had the same care the first year, does it not stand to reason they would have laid at six months? Would care have nothing to do with the age of laying?"

It seems to me this writer has left something out of her mash formula. Cocoanut meal, sure-milk, beef scrap and fish scrap are all protein feeds and need considerable ground grain to make a balanced ration. The barley balances them to a certain extent, and the greens they get on range still more, but they need bran or corn meal, or both, for a good balance. This is true, however, that chicks will not overeat on protein feeds. Commercial poultrymen who have tried feeding beef scrap in hoppers say the chicks do not eat heavily of it. Possibly these chicks have such good range that they need little beside.

Undoubtedly, feeding has a good deal to do with the age at which pullets lay. Whether it has as much to do as breeding is another question. Careful feeding hastens laying maturity and poor feeding delays it. I should like to hear from this writer again when her pullets begin to lay.—J. A. K.

EAT MORE EGGS

Eggs, milk and the leafy vegetables, according to H. L. Kempster, of the University of Missouri college of agriculture, contain substances known as vitamines, which are essential to growth. They are called the protective foods because they correct the faulty composition of seeds and tubers. Young animals fed on wheat, oats, barley, or other seeds fail to grow. The ration is inadequate, even if the feed includes beans, peas and potatoes, and even if moderate amounts of leafy vegetables are also fed.

Egg yolk contains about 33 per cent fat. Like butter fat it contains growth producing substances which are absolutely essential. These growth producing substances are not found in vegetable fats or oils in beef or pork fats.

Some protective foods are necessary if the health is to be maintained. Eggs should therefore become one of the regular articles of diet. The price should be a minor consideration. Eat an egg a day. They promote growth and increase your ability to withstand disease.

MISSIONARIES IN FEATHERS

We are at the beginning of the most wonderful agricultural development the world has ever seen. Those who have read the new missionary textbook, "Ancient Peoples at New Tasks", must have been struck by the power of the agricultural message for the lining up of the backward peoples of the orient. Mr. Arthur H. Slater, a Presbyterian missionary in India, in his effort to make the starving people of his district self supporting hit upon the poultry plan. The fowls of the country were poor and their eggs poorer. Mr. Slater, with the help of a Bible class in America, supplied his people with better stock and the result is the doubling of the weight of the fowls annually exhibited at his poultry show, of the size of their eggs and of the price received for them. Like examples are multiplying on all sides. The farm boy and girl are at the very fountain head of this sort of propaganda. America must teach the world to feed itself. Let the farmers of the nation respond.

The average wage paid in Canada for farm help in 1918 was $70 and board.

Mung Beans

The attention of the United States department of agriculture has been called to some exaggerated claims of the good qualities of the Mung bean and exorbitant prices asked for the seed.

The Mung bean was known in the United States previous to 1835. About 1853 it was grown under the names of Chickashaw pea and Oregon pea. One variety was rather generally known in the Southern States for many years as the Newman bean.

The Mung bean is one of the com monly cultivated legumes of southern Asia, the adjacent Malayan Islands, and the eastern portions of Africa. The seeds are used almost exclusively for human food and the fodder is fed to cattle. It is extensively used, especially in China, for supplying the people with bean sprouts, bean vermicelli and bean gelatin. Considerable quantities of Mung bean seed imported into the United States are utilized almost entirely by Chinese restaurants for sprouting.

During the last ten years the department of agriculture has introduced and tested about 100 lots of Mung beans from various sources. It is doubtful whether the best will prove a permanent addition to American agriculture.

This bean is not as vigorous a plant as the cow pea or velvet bean and does not compare very favorably with these crops for forage, green manure, or pasture. As a seed producer it is far inferior to the soy bean. Its initial growth is slow, the forage tends to turn black in curing and the pods shatter badly. The seeds are much subject to attack by weevil. Experiments conducted in the wilt and nematode lands in the Southern States showed all varieties more or less subject to both of these diseases. Under Texas conditions the seed yield ranged from four to 15 bushels.

As a food crop in America the Mung bean will not compete with common field beans and peas, but it may find use to some extent for sprouting. Bean sprouts are a valuable food and furnish a green vegetable at a time when such food is scarce.

Although under present economic conditions this bean is not to be recommended as a general farm crop, it has apparently a place in certain systems of agriculture. It is an excellent poultry feed, used as pasture when mature. Moreover, the beans can be used as are sprouted oats, as a green winter feed. This appears to be one of the most important uses of the crop.

Blasting Adobe Soils

The one characteristic that makes subsoil blasting a different proposition in "doby" from subsoil blasting in harpan, clay and other ordinary soils is that the former is bottomless so far as agriculture is concerned. It is not commercially practicable to break through to some other kind of soil beneath, because the depth in most cases is too great.

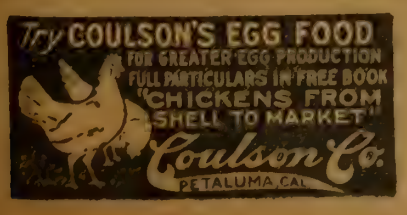
In subsoiling adobe, therefore, the effort should be confined to breaking up and mellowing a layer two to four feet deep, leaving the ground beneath that undisturbed. Such a depth is suficient to permit reasonably quick and thorough drainage and to provide feeding space for the roots of all crops, including fruit trees, if it is properly organized and developed.

It is not true that there is no good in adobe. Under chemical analysis it shows abundance of most of the plant foods. What it lacks, as a usual thing, is intensive application of the agencies which release its unavailable virgin fertility. It is characterized by exceedingly fine particles, and naturally is entirely puddles and packed solid. No air, to speak of, penetrates; humus is almost absent; and naturally food elements revert to unusable forms. There seems to be something about the adobe particle that makes it particularly slow, among soils, to give up its fertility, but this calls for more thorough work rather than abandoning the attempt to grow anything. The productiveness that may be secured is remarkable to anyone who is not familiar with the effects of intensive deep tillage.

After it is opened thoroughly by blasting, the important thing is to introduce just as much organic matter as possible and to get it in deep. A heavy rooted crop is the best means, since the roots themselves become humus soon after they die, and they are down where they do the most good. Comercial fertilizers carrying any elements lacking, such as nitrogen and phosphorus, should be used to start the cover crop or other first crops, in order to get a big growth. Two seasons of proper management should make adobe productive to a satisfactory extent, while if developed over a period several times this the result need not differ much from the best of loam and clay in other sections.

To develop adobe without subsoiling is a much longer process. The loosening, fining, introduction of organic matter, and moisture control must be extended downward inch by inch, by means of forcing growth under unfavorable conditions in the small amount of soil made mellow by strict surface treatment. In fact, so great is the handicap that the job often is not worth trying, as proved by the thousands of adobe projects that are abandoned. Under the circumstances blasting becomes not only advisable but indispensable.

FARMERS PRACTICE FALSE ECONOMY



A writer in the Prairie Farmer, who has just returned from a trip through certain farming districts of Illinois, comments on the lack of order, neatness, and paint in the farm houses along his road. He says: "The yards were full of weeds, there were no flowers nor vines, and the majority of houses were unpainted.

"Who would want to live in such a place? What attraction is there to keep the boys and girls on the farm? I felt like asking these people why they didn't paint up and clean up and make their homes look like something."

Soldiers are required to keep their equipment clean and their faces shaved because of the effect on their morale. A clean, trim looking soldier has more self respect and fights better than a slovenly one. The man who takes pride in the appearance of his place is a better farmer and a better man on that account. The whole family undertakes its tasks more cheerfully and more successfully because of it. The judicious use of paint adds to the sale or loan value of any farm. It helps to raise the standards of family life. It makes a man stand higher in his community and in the long run helps his pocketbook as well as his pride.

TO MEET FUR, FIN AND FEATHERS

Believing that a better knowledge of wild life will bring about better conservation of it and that when people are on their summer vacations they are most responsive to education on wild life resources, the California fish and game commission backed by the Nature Study League will institute this coming summer a series of lectures and nature study field trips designed to stimulate interest in the proper conservation of natural resources. The Tahoe region has been selected for the work this year. The work will be offered at six different resorts. The month of July is the time set. All lectures and classes will be open to the public and no fees will be charged. Illustrated lectures on the game birds, song birds, mammals, and fish will furnish evening entertainment and early morning trips afield will give vacationists an introduction to mountain wild life.

—you'll find it everywhere.

REGISTERED BERKSHIRES. FAIR OAKS RANCH, WILLITS, CALIF.

BIG TYPE POLANDS
W. H. BROWNING, WOODLAND, CAL.

HOGS

NICK GENTRY
Dean of the Berkshire Breeders, breeder of Baron Duke 201st, Grand National Champion, says: "I never saw a better width of loin than he has. If more breeders would produce the type of Baron Duke 201st there would be many more Berkshires raised and sold. Every animal on both sides in pedigree of Baron Duke 201st for many generations back were good ones; every one of them. His great size, good heart girth, very smooth shoulder, back and loin, legs and feet are hard to equal in one animal. If he is not a good one and a well bred one there is no other. I am glad to give you my opinion of Baron Duke 201st." N. H. GENTRY.
You can buy his three months' old weanling pigs from 650-pound prolific sows for $35.00. They are going fast. Order now.
SANDERCOCK LAND CO.
In charge of Natomas Land Sales.,
23 Montgomery Street,
San Francisco, California.

CASTLEVIEW

Giant Type Berkshires.

We are booking orders for spring pigs from Grand Champion sows and sired by Mayfield Rockwood, sire of Champion barrow at 1919 Western Berkshire Congress.

Castleview Ranch, Santa Rosa, Calif.

BERKSHIRES BERKSHIRES

ANCHORAGE QUALITY

We always have a limited number of specially selected pigs for sale sired by Star Leader, now Grand Champion of the World, or by his son Anchorage Leader II. All pigs are well developed and are excellent value for the price asked. All are cholera immune and the Anchorage Farm guarantee is behind each pig. Write today for full information to Anchorage Farm, Orland, Cal.

Billiken Chester Whites. Not many left now; one 1917 fall boar; one 1918 fall boar; both cholera immune. All pigs farrowed to date are booked for sale excepting 10 boar pigs. Have 10 sows yet to farrow during May, June and July; will book orders from these litters, delivery to be made when weaned. C. B. Cunningham, Mills, California.

DUROC-JERSEYS at IRELAND
The snappiest—big type—fall boars—in Southern California—are now on exhibition and FOR SALE. Sired by Cherry Vol. 2. Strongly bred Orion Cherry Kings. Some of them will be herd leaders. Ranch at Owensmouth. City Office, 1219 Brockman Bldg., Los Angeles.

Grape Wild Farm Berkshires. A few fall Boars by Big Leader Grape Wild Farm Leader and Majestic King, also spring pigs. A. B. Humphrey, Prop., Escalon, California.

Unsigned communications receive no attention.

Pig Ailing

About ten days ago I noticed that one of my pigs about four weeks old was red around the nose. I paid it little attention at the time but now he begins to slobber at the mouth and rub his nose on the ground and squeals. He eats well and seems right otherwise.—Subscriber, Chowchilla.

Can not tell what is wrong at this distance but would advise that you catch tht pig, turn him on his back, put a piece of soft wood in his mouth to hold it open and examine it for a thorn or splinter that may be sticking in the flesh. If nothing can be found; may be he has been rooting in some lime or ashes that have burned his nose. Oil or grease will relieve the irritated skin if the trouble is all in the outside. I presume you will find the cause if you look close enough.

Dog with Abscess

Last summer our Spitz dog had a large swelling under her ear that lasted for several weeks. At last it broke open and discharged a lot of pus. The same has occurred again. The swelling was not so large but it takes so long for it to heal. She seems all right otherwise. She is fed bones, corn meal mush cooked with a little meat and the heads of rabbits when we kill them. Is there anything wrong with the diet or what is it? — Subscriber, San Gabriel.

A barley beard or foxtail acts that way when working through the flesh of animals that eat hay but as dogs do not eat such things it may be due to a splinter of bone or something else. What caused the first abscess may not have all worked out and have started the second. Wash the place and search for something hard; you may find the cause. The skin is thick and the pus is slow eating through so if it occurs again it may be best to lance it and relieve the dog sooner. The diet is all right.

Bloody Wart

I have a fine young mule with a bloody wart, as large as an English walnut, on his cheek bone. It may have been started by the rubbing of his halter since I have been obliged to keep a span of young mules tied together to keep them in the pasture. The neck of the wart is comparatively small and I have wondered if it would be feasible and advisable to tie a string tightly about the neck and thus cut off the blood supply. Please advise me as to the best method to pursue in removing the wart.—Subscriber, Hanford.

Yes: A cord tied tightly about the base of the wart would probably do just as you say and in a short time the wart would drop off and the place heal quickly, but it might grow again. Pinch it off with a dull pinchers and touch the spot with a red hot iron, then the trouble will be over quickly and it will not be likely to grow again.

Bloody Milk

I have a five year old cow in fine condition that gave birth to her third calf about four weeks ago but we notice a little blood in the milk after it stands for a time. The udder is not swollen and we can notice nothing wrong with the milk while milking. Am feeding about five quarts of bran and half as much dairy food per day and all the alfalfa hay she will eat. What shall we do? — Subscriber, Yermo.

Bloody milk can not always be accounted for. It may be due to slight congestion of the udder from a bruise or from some other cause. Get three pounds of epsom salts and two pounds of common salt. Mix them and give a handful of it in the feed once a day. This will thin the blood and will probably relieve the congestion.

Legal Queries

Louis B. Stanton, attorney, 243 Wilcox Building, Los Angeles, will answer legal queries in this department.

Immediate mail replies cannot be given except where fee to Mr. Stanton is paid. When replies are wished in Cultivator address query to 115½ N. Broadway, Los Angeles.

Building Culvert

At the entrance to private property, is it compulsory for the property owner to put in culverts, or for the supervisor?—Subscriber, Mesa Grande.

It is the duty of the supervisor to establish the grade of the roads; not to improve private property in such a way as to enable the owner of such property to make entrance into his property at his convenience. If by reason of any important reduction of the grade, the private property owner has suffered damage, then he is entitled to recover such damage from the county, but generally speaking, he is required to make such improvements in the way of culverts and entrance into the property as may be to his own benefit and public benefit.

Turn Water Off Road

Will you kindly advise whether in California the road superviser may turn the water off the road into fields cultivated or uncultivated?—Subscriber, Mesa Grande.

A municipal corporation, or any state or county official has no more right than has an individual to collect surface water and precipitate it upon private premises to the injury of the owner. The law specifically sets forth a means whereby the board of supervisers shall in order to protect any public road or highway from prospective damage by storm water adopt a general plan of protection to lay taxes and condemn property so as to establish such improvements as will conduct the water from the roads along such lines that will not damage private property.

POISON BAIT FOR GRASSHOPPERS

A. W. Morrill of the Arizona commission of agriculture and horticulture recommends this poisoned bait for grasshoppers: Wheat bran (coarse), 25 pounds; Paris green, 1 pound; lemons or oranges (chopped fine), 4 to 6; molasses (Black Strap), 2 quarts; water, 3 gallons.

Thoroughly mix the dry bran and Paris green. The fruit, both rind and pulp, should be put through a meat grinder. The molasses, finely ground fruit, and about one-half of the water are mixed, added to the bran-Paris green mixture and thoroughly worked in. The balance of the water is added as needed to make a uniform stiff mash. In preparing the poisoned bait a wooden paddle or a hoe should be used instead of the bare hands.

Fewer Blisters

NO tire is blister-proof. If the tread is cut and left unrepaired, so that dirt and sand can force their way into and under it, any tire will blister.

But it *is* possible to make a tire tread so tough that it resists sharp edges remarkably. And it *is* possible to vulcanize and cure a tire so carefully that separation of tread from carcass rarely occurs.

Both of these possibilities have been realized in HORSE-SHOE TIRES. *They seldom blister.*

Those who know tires will see in this feature another reason why it pays to

Septic Tanks

GOING to the country to "build up" does not always measure up to expectations. Statistics have shown that there are a number of diseases, usually taking epidemic form, that frequently assume worse proportions in the country than in the well regulated city. Among these are typhoid, dysentery, and other intestinal complaints. Most of these are directly traceable to insanitary conditions or by wells, and it is practically impossible to prevent pollution of domestic water supply from such sources; therefore, it is to be expected that if plumbing is installed and all household wastes carefully disposed of in a sanitary manner, deaths from these communicable diseases will be materially decreased. Facts bear this out.

The farmer must adopt sanitary means of disposing of household

Design for Concrete Septic Tank with Automatic Siphon

This miniature drawing gives very complete information regarding construction of concrete septic tank. The perspective in lower left hand corner shows plainly the principle on which it works. The inlet is at the reader's left and the plank, or "stiller", is for the purpose of preventing disturbance of surface of sewage. Its outlet into the secondary chamber must also take in the sewage underneath the surface.

surroundings. Recent army tests prove conclusively that country boys do not in general enjoy better health than those from the city and many astounding revelations quite the reverse of common supposition have been made. Lack of rural sanitation is largely to blame.

Where unprotected privy vaults and shallow wells are used, epidemic intestinal diseases prevail. There is continuous seepage from an unprotected vault through the soil into near-

wastes and safeguard his domestic water supply if he is to protect and maintain his health. As a city sewerage system is not practical for the farm, a septic tank such as is shown may be used to handle household wastes in such a manner as to safeguard the domestic water supply and to dispose of the wastes in an inoffensive manner. A concrete septic tank like that shown can easily be built by any contractor without need of any special equipment.

Bean Growers of Merced and Stanislaus Ask Bean Market

The Merced and Stanislaus County farm bureaus met in joint session at Turlock on March 15, and the matter of the large amount of beans that is in storage at the present time with no market was presented to the meeting by the growers through their directors, stating that they were unable to find a sale for them, holding back business in many lines and incurring heavy financial losses to the grower.

A committee composed of A. H. Poore, Newman and O. E. Lambert, Modesto, was appointed by the bureaus to draw up resolutions and send to officials deemed best to lay the situation before. The following resolution was formulated:

"Be it resolved: That at the present time in these two counties and others, thousands of sacks of beans are in storage and it is impossible to find sale for them at a price which will net the grower cost of production. Many growers have obligations and expenses to meet that were contracted in raising beans and a large amount of this money has had to be borrowed from the banks, and inasmuch as these beans were largely grown at the urgent request of the government and the United States food administration officials, we feel that it is their duty to assist in every way possible to find us a fair market price for these beans.

"Be is further resolved: That we believe that all importations of foreign beans should be stopped and no more allowed until all the beans that were grown are disposed of."

California Handling Grain in Bulk

THE labor saving method of handling grain in bulk adopted after long experience in states east of the Rockies, where grain growing is the greatest business, should be sufficient recommendation to the California grain grower planning on adopting the more economic method of handling his wheat.

While the cost of sacks is dropping, compared to the quotations on them a year ago, they are still more expensive and more scarce than they were prior to the war. There is just as much reason for the handling of grain in bulk instead of in sacks, however, even though sack prices return to their former low level.

Saves Labor and Waste

The economic gain in labor costs and man power saved from useless work, as well as the ten per cent crop loss that can be prevented by doing away with the leaky, moldy, rat eaten, weather damaged sack, and handling and storing California wheat in bulk from the harvester to the terminal warehouse, is an important consideration.

Demonstrated in California

It is a most encouraging sign to notice the interest shown in California wheat and barley sections in the bulk handling method. The comparatively simple method by which the antiquated grain sack and its expensive sewe

and "jigger" and its multitude of warehouse laborers may be eliminated has been demonstrated in a number of instances throughout California. The familiar combined harvester can be fitted with a bulk handling bin into which the grain is elevated as threshed. This bin or hopper is emptied at stated intervals into grain tight wagons which can be driven under the spout while the harvester is in motion. A simple dumping apparatus at a central storage bin of the modern metal type of rust resisting material makes the unloading of these wagons a simple matter.

Machinery Instead of Men

Grain is elevated from the receiving hopper by ordinary grain elevating belts to which buckets are attached, or by the tubular steel elevators. It is safely stored under the weather proof roof in less than an hour from the time it is threshed. This method of handling immediately removes it from the reach of field rodents, rats, mice and other vermin; puts it beyond the reach of thieves, and protects it immediately from early rains, sunburn, and molding.

Crop Losses Prevented

At the same time it prevents losses through leaking and bursted sacks either in the farmer's field, the railroad warehouse, or in transferring it from the freight car to the terminal elevator. Conservative estimates place the annual grain loss at 10 per cent due to sack handling and storing.

Think of it! One-tenth of the California grain crop lost, and lost in such a way that no advantage whatever accrues to society.

Economic Gain Possible

This ten per cent crop loss is not the only economic waste connected with handling California wheat in bags. The useless labor involved in sawing and "bucking" sacks on the harvesters, handling them in the storage warehouses along the railroads, and at the terminal points, is another serious charge against this method. The useless waste of man power and the constant source of worry to the grower and harvester man, who at harvest time have to bid for help in a market already short because of other crop movements, is another vital essential.

Adopted Throughout the World

Bulk handling eliminates this economically wasted labor, prevents the 10 per cent crop loss of wasted grain, and represents the modern efficient way of handling grain in progressive countries throughout the world. It is to be hoped that bulk handling will become a common way of handling grain in California before many years.

CARELESSNESS CAUSES MOST FIRES.

Much of the enormous losses in human life and property caused by forest fires can be averted by proper preventive measures. To prevent fires forest service officials believe it is necessary that suitable laws be passed and strictly enforced and that all settlers, campers, construction crews and citizens in or near forests should cooperate to see that laws are enforced and otherwise aid in preventing fires.

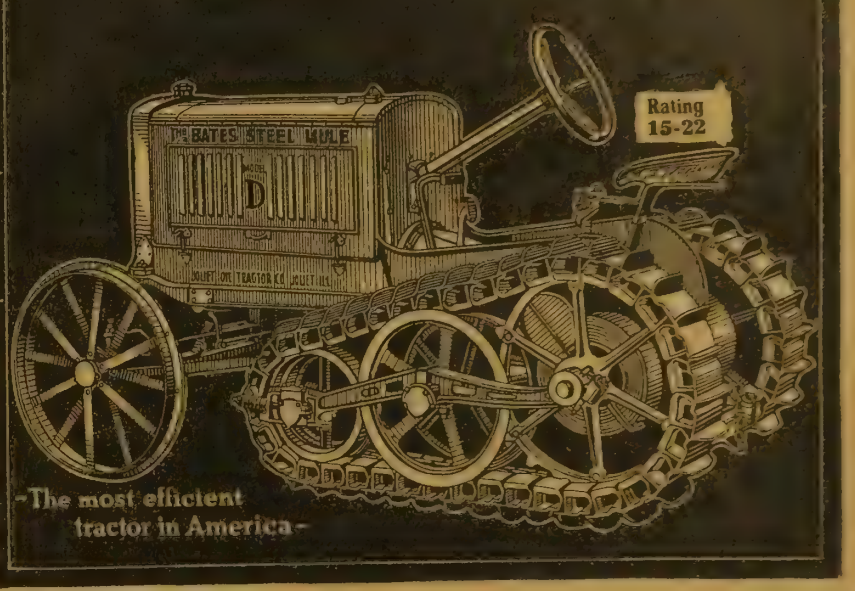
On the national forests, comprising 155,000,000 acres, representing 28 per cent of the timber resources of the country, the fire situation is fairly well in hand. Each year, through educational and publicity activities, as well as stricter enforcement of laws and regulations, sees a reduction in the number of fires through human agencies. To approach perfection in forest fire protection, however, it will be necessary to eliminate entirely all fires caused by human agencies. There is still much to be done along this line. Nearly three-fourths of the fires that occur in the national forests are due to carelessness.

J. R. Sandige, county agricultural agent for Gila County, Arizona, and garden expert for the Inspiration Consolidated Mining Company, has just made the final report of the garden operations for the year; 294 gardens were alloted and the total product from these gardens was estimated at $24,198. Ninety per cent of the gardeners were well pleased with the results and practically all of them have asked for the same garden next season.

Enclosed Working Parts

The unit construction of the Bates Steel Mule is such that not only is protection from dust afforded, but a permanent, rigid alignment of transmission parts with the motor is assured, regardless of any severe twisting strains to which the tractor may be subjected.

All working parts, of course, operate in an oil bath.



This feature, with the powerful twin crawlers driven by the valve-in-head, heavy duty kerosene motor, the hardened cut steel transmission gears and Timkin roller bearings, makes the Steel Mule a long-service tractor.

Belgian hares 15.

LIVE STOCK

For the last two weeks greater declines were recorded in the prices paid for live cattle than in many months before. This condition is brought about by the surplus of fed steers in Southern California being ready for market at about the same time.

It is true that many trainloads are leaving this section every week for Eastern markets but these shipments are made up from the holdings of large producers and feeders altogether. The feeders of five cars of cattle or less are compelled to unload their product on the local market and this is why the market is so liberally supplied and the market is so weak. A plan is on foot among several small producers to pool their holdings to make up a trainload and ship to either Chicago or Kansas City. Government contracts for export beef in Eastern centers afford an excellent outlet for fed cattle there but the outlet for dressed beef in Los Angeles is very much limited.

Hogs hold firm at the high level of prices existing for over a fortnight. Receipts are light. Shippers of hogs in California are receiving better net returns than those that ship to the large centers.

Lamb supplies are very liberal and prices weak. The market is over-supplied.

Ewes and wethers are holding steady.

Good steers	12.00@12.50
Medium steers	11.00@11.50
Common steers	9.00@10.00
Good cows	10.00@10.50

BEANS

Demand and movement slow. Market dull, little change in prices. Carloads f. o. b. usual terms, choice recleaned sacked per 100 lbs. season's average basis, 6.35@6.50. Large Whites, 5.75@5.90. Pink, 6.00@6.80. Red Mexicans, 5.20@5.40. Cranberry beans, 5.40@5.50. Black Eyes, 3.20@3.50. Tepary, 2.50.

GRAIN AND FEEDS

Barley: Feed, 2.40@2.45 per cental; shipping, 2.50@2.55 and 2.45@2.50 f. o. b. country.

Oats: Red feed, 2.15@2.30 per cental.

Corn: California yellow, 3.00@3.25 per cental. Egyptian, 3.00@3.20 for dry and 2.50@2.65 for rain damaged; Milo maize, 2.80@2.90 for dry and 2.60@2.75 for rain damaged.

Rye: 3.50@3.75.

Wheat—Following are net weight prices for bulk grain, based on federal standards and grades at San Francisco Bay and Los Angeles terminals:

Hard Wheat—	Per Bushel	Per Central
No. 1	2.20	3.66 2-3
No. 2	2.17	3.61 2-3
No. 3	2.13	3.55
Soft White—		
No. 1	2.18	3.63 1-3
No. 2	2.15	3.58½
No. 3	2.11	3.51 2-3
Club and Sonora—		
No. 1	2.16	3.60
No. 2	2.13	3.55
No. 3	2.00	3.48¼

For sacked grain add nine cents per bushel of 60 pounds to above price. Deduction of three-fourths of a pound is made for weight of standard grain bags. Wheat grading under No. 3 and mixed or smutty wheat will be purchased according to merit.

Mill Feed (per ton): Bran, 41.00@44.00; shorts, 42.00@45.00; middlings, 50.00@52.00. Rolled barley, 50.00@52.50; alfalfa, 30.00@32.00; scratch feed, 3.50 per cental.

HAY

Under date of April 26, Scott, Magner & Miller says:

Receipts for the past week, 2464 tons. Large receipts are accounted for by hay brought in to fill government purchases. This hay has to be double compressed for export and therefore requires much extra handling. Hay is still moving to the Southern states and most of the old alfalfa that was not rain damaged has been cleaned up. Considerable of the alfalfa that was damaged in the September rains, however, is still offering with little demand.

Cutting of Volunteer and the first crop alfalfa is proceeding in many sections. Most of the alfalfa contains more or less foxtail. A few sales of clean first crop are reported, but no general market has opened on new hay.

The lower San Joaquin reports unfavorable conditions owing to lack of rain but other sections promise a large crop, with the present cool weather very beneficial.

Fancy Wheat Hay (light 5 wire bale)	21.00@23.00
No. 1 Wheat or Wheat and Oat Hay	17.00@19.00
No. 2 Wheat or Wheat and Oat Hay	13.00@16.00
Choice Tame Oat Hay	17.00@19.00
Other Tame Oat	13.00@16.00
Wild Oat Hay	12.00@15.00
Barley Hay	12.00@15.00
Alfalfa Hay	16.00@20.00
Stock Hay	12.00@14.00
No. 1 Barley Straw, bale	50@80

Citrus Fruit Market

Los Angeles, April 30, 1919.

Navels are showing some little decay. Some of the heaviest shipping of the season has been the result of the past week's work. Shipments now are running close up to 100 per day. Markets somewhat easier.

California grapefruit is becoming somewhat of a factor and is being well received.

Lemons showing considerable improvement. Better prices will prevail as the weather warms.

Shipments

Shipments of citrus fruits to date since November 1, 1918: Southern California: Oranges, 17,895 cars, lemons 4192, total 22,087. To same date last season, oranges 8266, lemons 2199, total 10,465. Central California this season, oranges 3182, lemons 334, total 3516. Last season to same date, oranges 2422, lemons 115, total 2537. Northern California, oranges 244, lemons 2; last year same date, 202.

TRACTOR DEMONSTRATION NOTES

Continued from Page 612

J. I. Case Tractor

The Case people will be there with four sizes of tractors. The Case people are not only manufacturers of tractors, but of threshers, and, in fact, full line of agricultural machinery. The Case tractor will be given field test and will answer lots of such questions as "What will the machine do?"

Barn Equipment and Pumps

The American Pump Company of San Francisco and Los Angeles will be on the grounds demonstrating Louden Barn Equipment, Universal Milking Machine and Special Oil Pumps. This exhibit will be in one of the tents.

OilPull

The three-plow size of OilPull will be there. It's the 12-20. It has a motor built for heavy duty and a vast number of strong working points. Advance-Rumely Thresher Company of Indiana will show it off.

Monarch Tractor

The Monarch Tractor Sales Company and branches will demonstrate the tractor which will turn in its own length, responds quickly to the desire of the driver—but see it at the demonstration. It'll be there.

Cantaloupe Production in Imperial

By R. G. Risser, Bureau of Crop Estimates

THE commercial production of cantaloupes in the United States is highly localized. The total number of cars shipped in 1918 as reported by the bureau of markets was 13,277. Seventy-five per cent of this volume originated west of the Kansas-Colorado state line, 51 per cent in California, and 33 per cent in Imperial County. The three states which shipped over 1000 cars each were California, Colorado and Arizona.

For several years Imperial Valley has maintained a big lead among important cantaloupe districts in earliness, acreage and total output. For the past five years between four and five thousand cars have rolled from this district each season to supply the tables of the nation. Cantaloupe production in the Imperial Valley has thus become firmly established as one of the big things in the truck crop business of California and one of the important industries of the valley.

Present Situation

The acreage of cantaloupes grown in the Imperial Valley is larger this year than ever before. 13,822 acres have been reported under contract or otherwise grown on the extensive irrigated ranches of this reclaimed portion of the desert. Fields now under cultivation are developing a crop for May, June, and July shipments which promises to break the shipping records of former seasons. The rush of harvest will soon be on and melons now in the making will be carried forward under refrigeration to all the important markets of the United States.

Early Development

The commercial cantaloupe business received its start in the desert portion of Southern California in 1900, when the value of the product as grown in a Coachella Valley garden was first recognized and a trial shipment was made to Chicago. The next year an acreage was arranged for and 11 cars were shipped. Later the industry was transferred to Imperial Valley, and in 1905 297 cars were shipped. The second year 577 cars were shipped, but the selling agencies had difficulty in distributing this quantity and the pioneers in the industry little dreamed of the magnitude which would be attained by the cantaloupe business of this section a few years later. The earliness of the shipping season, however, gave Imperial Valley a unique place in the production of cantaloupes, and this advantage was sufficient to stimulate a much further expansion of the enterprise. Yet it was not until the bureau of markets sent its representatives into the field in 1915 that a satisfactory system of distribution was established and the future of the industry assured.

Recent History

The cantaloupe industry of Imperial Valley is 20 years younger than the same industry of the famous Rocky Ford district, but during its brief period of existence it has encountered many discouraging experiences which cannot all be recounted here. Perhaps the changing of the course of the Colorado River in which cantaloupe fields were washed away by the raging current was the most spectacular, but every season there were obstacles overcome in the growing, packing, shipping and marketing of the big volume of this perishable product. Aphis, frost, nematodes, and winds often injure the growing plants, but growers are at least no more affected by these troubles than they are in other districts and are particularly fortunate in escaping damage from rust and hail. The story of the business can best be told by the following records which cover recent years:

Season	Acreage	Shipments Cars	Yield Crates
1915	8156	4722	194
1916	8492	4617	182
1917	12939	5041	130
1918	10896	4102	156

The yield of shipping stock is computed in standard crates on the contracted acreage as this is the most definite basis. The actual number of crates on the net acreage would be somewhat higher, but the system used is the most satisfactory for comparing different seasons and for arriving at the usual commercial production on the area commonly used for growers' advances.

Shipping Season

Records from 1913-1918 show that the earliest date a car was shipped was May 16 of 1916, while the latest seasons were those of 1913 and 1917, when the first car did not go out until June 4. The peak of the season usually comes on June 15, though in one season, that of 1915, the greatest output was on June 23. The last car shipped is usually around July 20, though one year, 1917, it was as late as August 1. The season usually covers 55 to 60 days, the longest season being in 1916, covering a period of 65 days.

THRIFTY BELGIUM

We in this country can learn a wonderful lesson of thrift from the people of Belgium. It has been aptly said that farming in Belgium is like gardening on a large scale. The soil for the most part is thin. Yet so carefully does the Belgian farmer cultivate every inch of ground that the crops per acre often double in quantity those raised in our own country.

The farms in Belgium are smaller than those in any other European country. The average size of a farm is less than six acres—5.7 acres to be exact. Although the people of Belgium are by no means wealthy, there are surprisingly few paupers. Farm hands, it is said, stand a better chance of becoming land owners than in almost any other land.

Before the war there were in Belgium 156 head of cattle to the square mile. This is a greater number than in any other country in Europe. The Belgians are excellent dairymen. The most scientific methods are followed; the health and productiveness of each cow are carefully guarded and great pains are taken that there shall be no wasting of the milk and cream which are produced.

Of all the independent nations of the world, Belgium is among the smallest. It is less than one-fourth the size of New York state. Twenty-three countries the size of Belgium could be placed in Texas and there would still be a little room to spare. In exports and imports, this small country holds sixth place among all nations. In wealth it stands eighth.

PLAN FOR THE SILO

California has seen great increase in the number of silos during the past few years. This increase has not been so great as it should be. The fact that the state can to an extent produce green pasturage the year around has given an idea that it is hardly the state for the silo.

This is planting season, or at least planning season, for the crop and for the silo to hold it a very few months later. "It pays for itself in a year", is the assertion of some who have tried it out. In fact, here are a number of one-sentence reports secured by the Colorado agricultural college from silo farmers of that state:

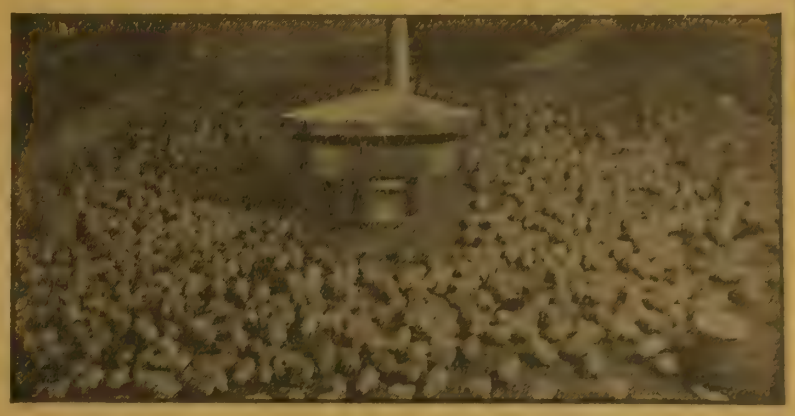
"My silo saved me $150 the first year in hay."

"The silo keeps the feed where it cannot dry up, blow away or rot."

"Everything thrives on good corn silage, even turkeys and geese."

"My silo cost $450 and it has paid for itself in two years."

"Silage is fine for weaning calves."



"My silo cost $289 and paid for itself the first year."

"I feed ensilage to hogs once a day. They clean it up in good shape if not given too much."

"Silage saves all the feed and retains the strength."

Reports are common in the Santa Clara Valley of offers of as high as 11 cents for prunes. The California Prune and Apricot Growers' Association refuses to name price until crop is known.

The Pride of Petaluma

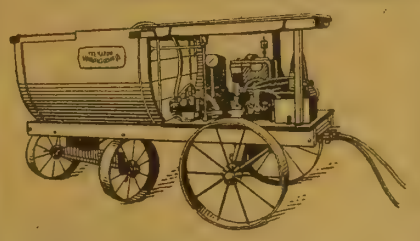
VENTILATING BROODER STOVE

Solves **VENTILATION**, gives about ten times more **WARM FRESH** air to chicks than any other brooder stove.
It's the only brooder stove with two **RADIATORS** hence compound **ECONOMY.**

It keeps chicks from crowding by proper application of heat, the only **SENSIBLE** way.

It's the only brooder stove using **CHEAP OIL TOPS** successfully as fuel.

It's **PETALUMA'S** latest sensation, and only brooder stove. It skins the bunch in **ECONOMY, Volume of VENTILATION** and **PROPER APPLICATION** of **HEAT. GUARANTEE—SIMPLY** send it back any time within 30 days' trial if you don't think it beats anything you every saw.



Get our catalogue No. 25. That's fair. **TRY IT.**

ADDRESS:

Kresky Brooder Stove Factory

Petaluma **California**

The Famous Hardie Junior is a Real Power Sprayer

It has sufficient capacity for two lines of hose. It has plenty of power for **high pressure effective spraying.** It is little in first cost, engine power, pump capacity and ability to do successful spraying. We believe this is the **greatest small power sprayer** ever manufactured, and placed on the market with phenomenal success in every fruit section in **United States** and vouched by thousands who own the **Famous Hardie Junior.** Equipped with one and one-half horsepower engine, battery ignition, 150-gallon tank with mechanical agitator, capacity of four gallons per minute with a steady working pressure of 200 pounds, and two 25-foot of the best spray hose, fitted with spray rods and nozzles; 4-inch tire truck with pole or shaft.

All for $300. Delivered anywhere in this state

If truck is not needed, deduct $55.00.

These prices are subject to change without notice. The wise buyer will place his order now.

This low price is made possible by big production.

If you are interested in other types and sizes of the **HARDIE POWER SPRAYER** write us for the big spray catalog, and learn why we can offer more spray pump value than any other spray pump manufactured.

The **HARDIE ORCHARD GUN** is now $12.00, none better, all guns are guaranteed to satisfy the user or their money refunded. The Hardie spray hose is the safest hose to buy.

International Service

THERE comes a time in the life of every motor truck, no matter how good it is, when some part requires replacement or adjustment. When that time comes, the necessary part must be at hand — the right part and without loss of time. Or the man to make the adjustment must be immediately available. The International organization is unrivaled in this respect.

When these things are to be had, that is *service*. When the motor truck performs well, that, too, is *service*.

International Motor Trucks

are built with *service* as the foundation. These trucks will serve you well because they are "factory built" all the way through — not assembled—and because the Company that makes them has at stake an enviable reputation for building high-grade machinery—a reputation which has endured for nearly a century and which is bound to be maintained.

"Built — not assembled." That statement carries weight with men who have had experience with motor trucks. It means that every part of the power plant is designed and built to work smoothly and efficiently with every other part. In the International, it means a simple, powerful, heavy-duty engine and a transmission and internal gear rear axle that converts the power of the engine into mileage without waste of fuel and without unnecessary strain and friction losses. These are the units on our truck that you will want to become familiar with and compare with the same units on other trucks, because they are responsible for its performance.

There is a style of body and size of truck to meet practically every hauling requirement. Write for descriptive literature.

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertisers in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

THIS WEEK'S COVER

Millions of wealth in the Sacramento River and other millions of wealth taken out grow alfalfa, rice cotton, sugar beets, all kinds of fruits, and make the desert blossom. Some of this wealth is shown in the illustration on this week's cover. This photograph was taken by the Cultivator camera at the bridge crossing the river at Butte City. A lot of us Californians are surprised once we see the two great rivers which drain the great central valleys. The dry wash is our ordinary impression of the California "river," but the Sacramento and the San Joaquin are different, and in fact are larger examples of what many smaller rivers are to the state in supplying wealth giving irrigation. This scene was taken nearly 200 miles from the mouth of the river, and yet far above this point navigation affords cheap transportation for California's hay, fruit and other crops.

KEEPING BOOKS?

Speaking of that income tax which many Cultivator readers have just finished paying, permit us to remark that carefuly kept accounts will save lots of sleepless hours next January and February.

AUTOMOBILES

This country has more than 6,000,000 automobile owners. This is approximately one to every 18 people, and the ever-present estimator estimates that at least 15 of these 18 people ride in autos. No wonder we are demanding better roads, and the roads will be still better before they are worse.

WHEAT

The United States sure has one government contract on its hands to meet the $2.26 price on its billion bushel crop, in fact, it will be a billion plus from present indications, for winter wheat alone promises well up towards a billion bushels. Spring wheat sections report all seedings looking fine. The production will be far in excess of any former year.

TRACTOR DEMONSTRATION

These are days for the Cultivator's camera which is taking everything and everybody at the great tractor demonstration at Arden Acres this week. Members of the Cultivator staff are on the ground and will endeavor to absorb some of the producers impressions of farm power as shown at this great demonstration and give them to Cultivator readers in the next issue.

MORE HIGHWAYS

It is predicted that there will be more improved highway construction in 1919 than any preceding year. The department of agriculture and other activities at Washington are pushing for a big campaign. Almost every state is contemplating liberal bonding movements and the construction of thousands of miles, and within California many counties are also anticipating active campaigns.

LOOMS IDLE

At the price one is compelled to pay for wool in clothing it is hard to understand why there are so many looms and so much wool machinery idle as reported by the bureau of markets. Almost 50 per cent of this wool machinery is idle. Government contracts have been absolutely cut off, but if clothiers claims that it is impossible to secure sufficient woolens are true the ordinary consumer is compelled to ask why. This country grows the wool; there are the factories to work it up; let us have better clothing.

WAR INSURANCE

The treasury department is calling the attention of beneficiaries of war insurance policies to a misunderstanding which has prevailed with many. It seems that in addition to the war insurance, compensation has been provided for the dependents of those who carried no insurance but lost their lives in the war. This compensation takes the place, in a way, of the old-time pension system. In order to secure this pension, or "compensation," dependency must be proved. This has created a misunderstanding, and the treasury department is asking the press to pass on the word to beneficiaries of these war insurance policies that there is no necessity of proving dependency in case of the insurance. This is a straight business proposition, or, as the department states it: "Insurance is payable regardless of any dependency and a beneficiary designated in an application for government insurance if within the permitted class of spouse, child, grandchild, parent, brother or sister, is entitled to receive the insurance in monthly installments without proving any dependency upon the insured."

Many of the returning boys are also ignorant as to advantages in vocational training which may be had by the wounded or incapacitated.

FARM SOCIETIES

"National Farm Associations are becoming about as numerous as church denominations. Even Heinz 57 varieties are paling into insignificance." This rather discouraged expression appears in the Nebraska Farmer, which goes on to enlarge upon the near catastrophe which is visited upon the farmers in this country by this "jining" spirit, and the fellows who wax fat on the promotion are waxing fatter by encouraging this spirit. Quoting again from the Farmer:

"As an illustration, two promoters blew into a prosperous Iowa community, called a meeting of farmers, told them how badly they were abused and that the only remedy was combination. They started a national association, took over $500 from 50 farmers and left them the sole members and possessors of a local, state and national farm organization."

There are some dependable farmers organizations formed and maintained by real farmers. When the farmers are ready to organize, let them organize, whether it is for their own local cooperative marketing or in a larger way for shaping national affairs. Every farmer should "join up" with some good strong national, and surely some good local, organization, but don't let the promoter farm the farmer.

GREATEST LIVE STOCK PROBLEM

On another page appears an article regarding the live stock marketing situation existing in this state. The pitiful weaknesses of our present archaic system are pointed out and the suggestion made that the time has come when a more modern system is needed.

California is on the threshold of an era of marked live stock expansion. From Siskiyou to the Mexican line live stock men are manifesting more interest in their business than ever before. Better bulls are finding their way to the ranges; better methods of management are being adopted. Last year, for the first time California produced enough pork products for home consumption—and the surface has just been scratched.

The one limiting factor—and it is the most important—in the future development of the live stock industry of this state is the lack of a satisfactory marketing system.

Until producers are provided an open market with competitive buyers and quotations based on grades, it can not be expected that the industry will expand to anywhere near the proportions that our natural conditions warrant.

The time has come when cattle, hog and sheep producers should demand a marketing system that will enable them to receive every dollar their stuff is worth. We believe that a properly regulated union yard will provide such a market, therefore we commit the Cultivator to any sound plan that will hasten the day when California producers of meat animals will have the same advantages as Eastern producers.

We recognize the fact that certain evils have developed in Eastern yards, but we believe that Coast interests can and will profit by the mistakes of the older producing centers. We further believe that any plan for better markets must originate and be forced through by the producers, and that now is the time to start.

We will welcome an expression on this subject from any of our readers.

PRACTICAL CENTENARY

The Methodist church is observing the centenary of its first missions and is making a drive as one feature of that centenary to raise $105,000,000 for the extension of missions and the work of the church during the world's reconstruction period. The $105,000,000 is to be raised during the next five years. Every district in which the church has already pulled off this campaign has gone over the top with more than its proportion. There is one very practical feature of this campaign. The Methodists have for years made their hospital or nursing service a great factor in the foreign work and now throw their energies not only in that direction but also toward agricultural development. This in lands which sorely need such help. The first work along this line is to be taken up in southern Sicily where native farmers are still using the implements of a thousand years ago. One feature of the work has to do even with a large cooperative farm to give opening for laborers unable to own land themselves.

FRUIT GROWERS AND FARMERS

"The greatest horticultural and agricultural week yet on the Coast" will be that of May 26-30. The announcement was first made more than a year ago that this event would be held last fall. "Flu" ordained otherwise, and postponement was had until the time of the spring convention, and there has been material gain because of this postponement, for now, instead of one convention, come six.

First, there is the State Fruit Growers and Farmers Convention, formerly the State Fruit Growers Convention, held in California from olden time, in fact, this is the fifty-first of these conventions. Next in age comes the State Nurserymen's Annual. The State Association of Horticultural Commissioners will also convene. Then there will be the Vegetable Growers Conference, the conference of the Pacific Slope Branch of the American Association of Economic Entomologists, and, most far reaching of all, the Interstate Plant Quarantine Conference.

State Horticultural Commissioner Hecke has given much of his time to arrangements, and Deputy State Commissioners Weldon and Mackie, together with efficient local committees in Riverside, are making preparations for the noted event.

Riverside people have made provision for camping in one of Riverside's most beautiful parks where free ground, free firewood, free baths in the plunge, boating and other privileges will be given. For others who prefer hotel accommodations, Riverside has abundance. General outline of program in next issue of the Cultivator.

The department of interior has agreed to leave the decision of the matter of lands to be irrigated from the proposed dam on the Verde River, Arizona, to a board of engineers, one to be appointed by the Salt River Valley Water Users' Association, one by the Paradise Valley Verde project and one by the United States reclamation service. Homer Hamlin of Los Angeles has been nominated to represent the United States reclamation service in the matter.

Grain sorghum is grown in the West Indies under the name Guinea corn, the original seeds probably coming in slave ships from the African coast.

Irrigation of Rice Fields Has Added to California's Wealth
This is one of the rice irrigation districts of Northern Sacra mento Valley and shows a fertile stretch of miles of rice fields.

Do It Now---Later is Too Late

IT'S funny how we all have our way of looking at things, at least as to how we think we look at things. Take, for instance, the Irwin irrigation measure which was passed by the recent session of our state legislature. One man thinks he sees relief for the small land holder, and he says: "The land barons are doomed." Another's strabismus induces him to say: "This bill is for special interests as against irrigation districts in general." There you are. Pay your money and take your choice.

Imperial Valley Methods
In the Imperial Valley the method of irrigation shown above prevails with cantaloupes and many other irrigated crops. The cantaloupes, lettuce, etc. are planted along the sides of the levees above the water line and receive most of the moisture from the seepage of water flowing between rows.

Our choice is that this bill will bring relief to many people who have long desired irrigation and have been unable to secure it because of the requirement of the old irrigation district law that at least two-thirds of the property owners must unite in the demand for formation of a district. Under the Irwin act a majority is sufficient.

One of the satisfactory features of the passage of this bill is the exceptional majority given to it. In the assembly the vote was 57 to 14. We trust the results of the passage of this bill will be so satisfactory that later sessions of the legislature will pass other measures that will encourage irrigation, more intensive farming, greater prosperity and happiness for the small farmer, and, of course, greater prosperity for the state.

The last two years of agriculture in California have shown an anomaly in this, that the greatest crops ever have been produced with the least labor. The war took our boys; the country demanded more; and the producer was continually asking, "How may we secure power or improved equipment to produce better, greater and more economically?" The tractor, power and implement people anticipated the need and in large measure met it. The irrigation people, likewise, have been busy, and today's irrigation equipment has been perfected so that labor saving appliances have multiplied and are being used. This has not only meant labor saving, but it has meant in many cases water saving, and water saving means increasing California's wealth, for the waters so far conserved are woefully insufficient to irrigate thousands of California's rich acres.

The making possible through the Irwin bill of organization districts may still further aid in conservation of waters now going to waste. Direct state aid should also be given to every effort to store up the floods. Still more should our national government be appealed to to aid in conservation. California has felt, and justly, that the reclamation service has not given this state proper consideration.

But this will be one good year for every Californian to conserve both water and labor, and to that end here are a few conservation hints:

A Hint to the Wise is Sufficient

Throw out the old dirt head ditch; use concrete with latest improved gates, or outlets, or at least a board flume with the thin metal or board outlets. The labor saved by these appliances soon more than covers their cost. If the long supply ditch or canal has dirt surface, at least look out the gravel beds and line so as to prevent the immense seepage often suffered. A thin coating of cement on the dirt will answer for a short time. If this is impossible, at least oiling will make a saving of water. Where dirt head ditches are necessary, every convenience, such as division boxes, sluice gates, boards set in the bank with small outlets, tappoons, canvas dams, etc., should be used.

For underground or pipe line delivery systems there are all kinds of gates, valves, measuring weirs, and—it appeals to us as the most satisfactory of all—several forms of meters which, more accurately than the engineer can give measurements, aid the cultivator in knowing exactly the amount of water he is receiving.

"But these improvements cost." Sure. They likewise save.

"But prices are high; some time they will be lower." Maybe. But that, likewise, costs again. That is, it costs in time, in labor, in water.

We have always maintained that as a general thing the producer who markets his crops as soon as they are harvested and ready for a market is generally more successful than he who holds and waits for the top of the market. It's a wonderfully long-headed man who can put his finger on the peak of the prices. Likewise, in buying needed appliances used in production, it's the long-headed man who can put his finger on the greatest depression in prices and thus buy most advantageously. While one is waiting for this time to come, lost opportunity, loss of satisfactory prices—which may not obtain later—and other losses may far more than cover any gain. If your irrigation system needs perking up, do it now. Or, as an Eastern agricultural association states in its slogan: "Don't ask questions; go to work."

Irrigation Depth Tester
Slender steel rod for testing depth of irrigation on heavier soils of Riverside Heights section. Sub-soil becomes very hard if allowed to dry, but when thoroughly watered after several hours run it is easy to shove the above tester two, three, or even five feet into the soil.

A Multiple Arch Dam
One of the latest in dam construction, Lake Hodges on the San Diegito River in San Diego County. It is of reenforced concrete construction. The upper picture gives the view from above over the reservoir side; the lower shows dam from below. This dam creates a storage reservoir and will back the water for many miles and supply water for several thousand acres.

There may be a bit of interest in a statement which has been issued by a large manufacturer in this particular matter of prices. We quote it without indorsing or otherwise.

It is interesting to observe that many manufacturers think that prices must come down, including the price of labor, but they are ready to demonstrate to you that their own prices can not come down, nor can they pay lower wages. Almost everything they buy somehow costs twice as much as before the war, and their labor is twice as dear. They cannot pay their labor less if labor is to meet the increased cost of living.

Now, as a matter of fact, when we investigate almost any individual one of the so-called high prices for industrial products, we are likely to find that individually it is not high; that is, it is not high relatively to the rest. Our quarrel is with the general level of prices.

All prices have risen, but some have

(Continued on Page 657)

Agricultural News Notes of the Pacific Coast

Northern California

The olive interests of the state are calling for a tariff on olive oil.

A carload of California asparagus sold in New York last week for $6000.

The first box of cherries sent out from Vacaville was sold in Chicago for $50.

Colusa County appreciates the over half an inch rainfall of the last week of April, which was a great help to the grain crop.

The farm bureau of Eldorado County is backing the chamber of commerce in the effort to secure the location of a creamery at Placerville.

Construction has begun on a big rice mill for Colusa. There is a call for new houses to shelter the workers who will come to operate the mill.

The Newcastle Fruit Growers Association has just held formal opening of what is said to be the largest shipping plant in Northern California.

Experiments are being made by C. A. Wetmore of Marysville in the crushing of olives on a small scale for the making of oil by growers of a few trees.

The new gin of the Dodge Land Company at Chico is now started on regular ginning work. The seed is not pressed for oil but is to be saved for planting.

The Sonoma County farm bureau is already laying plans for the county fair to be held the coming fall. The fair will be under the direction of the farm bureau.

The grape growers of the state have begun a campaign to secure signatures to the two referendum petitions they will put forth against national and state prohibition.

The Lake County Bee is authority for the statement that nearly all the Lake County Bartlett pear crop has been contracted at $75. Crop indications are extremely good.

Manager Madden of the Auburn Fruit Exchange, Placer County, estimates all fruit crops in excellent condition, except cherries and early plums, which show somewhat spotted condition.

Truck owners of the Sacramento Valley have formed the Sacramento Valley Motor Truck Owners Association. It is expected to extend the organization all over California. These truck people handle farm products.

The old established fruit packing and shipping house of Geo. D. Kellogg and Son of Newcastle, has been sold to the Producers' Fruit Company. Kellogg was one of the first Californians to ship fruit to Eastern markets.

Many of the farmers of the Sacramento Valley have this year added small flocks of sheep to their farm stock. Fred Mendosa of Colusa County reports an average of better than 14 pounds wool to the sheep at 50 cents a pound. He raises Merinos and blackfaces.

At the recent meeting of the Amador-Eldorado Live Stock Association it was unanimously decided to affiliate with the California Cattlemen's Association. The following officers have been elected to head the association for the coming year: President, Frank S. McCullough; vice-president, R. S. Swift; secretary-treasurer, B. C. Celio. New directors elected were E. Bamert, Elmer Rupley.

Central California

Manteca, San Joaquin County, is planting extensively to cantaloupes.

Several plantings of peanuts have been made in the Turlock district.

Large additions are being made to the creamery at Oakdale, Stanislaus County.

The Tulare Live Stock Association has decided to hold a fair some time in October.

The 1919 irrigating season has started in the Terra Bella district of Tulare County.

Some growers of canning peaches say they are expecting to sell for $60 or $70 per ton.

James Madison of Fresno has sold a vineyard tract of 520 acres near Reedley. Sixty acres are in figs.

Several counties are investigating as to advisability of uniting with state organization of farm bureaus.

It is estimated that the almond crop of Stanislaus County will show an increase of 150 per cent over last year's.

The state fish and game commission has decided to locate a fish hatchery on the Kaweah River in Tulare County.

Plantings of nursery trees are being made later this year than ever before. Tree planting is usually finished in March.

Santa Cruz County has had successful squirrel "drives". The farm bureau is now supplying several tons of poisoned barley at cost.

The Alfalfa Growers of California held a district meeting at Delano, April 24. This district comprises Kern and Tulare Counties.

Tulare County cantaloupe growers have held farm institute or trip of investigation in cantaloupe growing sections of Stanislaus County.

Tulare County Poland-China breeders recently met at Visalia and discussed county organization to look after interests of that breed.

The fat hog auction held by the farm bureau at Modesto, April 18, brought record prices. One carload brought nearly 19 cents per pound.

The San Joaquin Valley Milk Producers' Association is seeking to organize 16 cooperative plants in the territory between Bakersfield and Merced.

One beekeeper of Santa Clara Valley claims to have recently received an order for $14,500 worth of bees and queens from an alfalfa seed grower of Nevada.

The state board of viticulture is receiving requests for aid in wine grape marketing, and unless other arrangements are made the board is recommending drying all wine grapes.

County Horticultural Commissioner Cody of Santa Clara County, with Dr. Nougaret of the United States department of agriculture, has been making experiments in spraying to control mealy bug.

Santa Cruz County farm bureau management is serving notice on members of the centers in that county that they must pay up or will hereafter fail to receive the farm bureau monthly.

The Yosemite Valley Highway Association has undertaken a campaign to raise the $1,000,000 still needed to guarantee the construction of a paved year-round highway from Merced to El Portal via Mariposa.

Southern California

Redlands has sent out nearly all of its navels.

Plenty of trout reported in the Bear Valley waters.

Riverside is now shipping out about ten carloads of oranges a day.

Cantaloupes are planted on 13,822 acres of land in the Imperial Valley.

J. F. Franke of Santa Ana has just secured patent for his walnut picker.

From $40 to $50 per ton is being offered for apricots in the Hemet Valley.

Brawley has already shipped 13 carloads of cattle to Kansas City markets.

Redlands apricot growers are expecting a big yield; trees are heavily loaded.

In the season from November 1 to May 1 Covina shipped out 1270 carloads of navels.

Cantaloupe growers of Imperial Valley are backing the movement to secure better roads.

There has been a light planting to potatoes this year in the Fullerton district of Orange County.

Horticultural week at Riverside May 26-31 will attract fruit growers from all sections of the state.

Imperial Valley wheat growers are hoping to get better than the government minimum for their early wheat.

The San Fernando district shipped out 20 carloads of Cannonball cabbage last week; also 20 carloads of lettuce.

Antelope Valley recently held a three day squirrel "drive", the time being devoted to placing poisoned barley.

Imperial Valley supplies 33 per cent of the cantaloupe crop of the United States; the state of California, 51 per cent.

Cabbage growers of the Fullerton district of Orange County are now getting $80 to $90 per ton for their cabbage.

County Commissioner Kellogg of Santa Barbara is advising the irrigation of walnuts unless there are heavy rains.

The price on Lima beans has been advanced to $7.50. This is the second advance since the formation of the selling pool.

The first carload of onions sent out from the Coachella Valley was shipped by Ira W. Richards of the Flora Del Vale section.

Cantaloupes are growing well in the Thermal district. From present indications shipments will start about the 20th of this month.

San Fernando last year shipped 168 carloads of potatoes during the month of July and prospects are for a 40 per cent larger crop this season.

The Orange County farm bureau held a picnic meeting at Orange County Park on last Saturday. There were addresses on soil fertility and an exhibit of tractors.

Los Angeles County sent out its first Eastern carload shipment of strawberries on the 15th of April. About 20 carloads per week will be shipped in the height of the season.

Poultrymen of San Diego County are hoping to secure a Poultry Extension school of the University of California. Members of the farm bureau who are interested in poultry are pushing the campaign.

The Coast and General

Latest quotations of Pima cotton at New Bedford are 55 to 57 cents.

Large acreages of potatoes, corn and beans are being planted in northern Arizona.

Damage done by wireworms to wheat is reported from the Walla Walla section of Washington.

Latest estimates of the cantaloupe crop for Arizona indicate it to be 4500 acres. Most of this is in the Salt River Valley.

Easter eggs in Arizona brought the highest prices on record for the season. Wholesale prices were $12.00 to $12.50 a case.

Ralph Tuttle of Walla Walla recently received five Holstein cows with world records from the J. von Herberg stock farms at Kent, Washington.

It is reported that 48 cars of lettuce was the total shipment from the Salt River Valley of Arizona this season. The crop was somewhat smaller than early estimates.

The Salt River Valley, Arizona, Water Users' Association is to take over the ditches caring for the waste water. This, it is believed will do away with the menace of flooding the roads and will also result in saving considerable water.

Several attempts have been made to grow rice at the Yuma Experiment Station, Arizona, but these experiments have not proved successful and it is not likely that rice can be successfully grown in irrigated lands similar to the Yuma Valley.

The Walla Walla Valley Cooperative Jersey Bull Association has been organized with C. M. Christiansen of College Place, president; H. C. Gordon, Walla Walla, vice-president; and R. E. Bean, Freewater, secretary-treasurer. The purpose of the association is to secure high quality bulls for improving the herds owned by members. Two bulls are now owned and the third is being bargained for.

Cotton experts of the Salt River Valley estimate the acreage planted to be 80,000 acres. While cool weather delayed planting somewhat, it is expected that it will show about the same condition by the middle of May as in ordinary seasons. Most of the cotton has been put in under first class conditions as there has been plenty of labor and a large number of tractors for a thorough preparation of the land.

Sheep shearing is half over in the Yakima Valley, some weeks earlier than usual, and there is considerable dealing for sales. The E. Berg clip, 40,000 pounds, has been bought by Webb of Boston; Stice Sheep Company clip, 12,000 pounds, by Charles Green, and William Wilson clip, 20,000 pounds, by The Dalles Scouring mills. The price for all lots was 35 cents a pound. Indications are that the 1919 clip from the valley will be slightly over 1,000,000 pounds.

Transcontinental railroads have been authorized by the Interstate Commerce Commission today to file package specifications, estimated weights and loading regulations governing shipments of dried fruits from California, Nevada and Utah to destinations in Iowa, Minnesota, North Dakota, South Dakota and Ontario without formal hearing. It was represented that the proposed regulations would prevent serious loss to carriers and wastage of fruit products.

One of California's Pumping Stations

Irrigation and drainage in this state show a great advance, and stations like this and others, in sizes all the way down to the little "put—put—put'er" in the corner of the small truck farm, are to be seen in all parts of the state. This plant is the pump house and outlet at Sacramento River drainage plant of District 108.

Work of the State Water Commission

By W. A. Johnstone, State Water Commissioner

The state water commission, like all other "commissions", has been discussed somewhat as to its advantage to irrigators of this state, but it has been a factor in straightening many a muddled situation created because of lack of satisfactory water legislation. California's water legislation can never be entirely satisfactory to all. In the earlier days of the state's history rights were created and perfected under the old common law of England and such laws as had established precedence in this country, and these were all more largely influenced by navigation than by irrigation. However, the rights were established, crops grown and values created which would not permit of complete revision of irrigation laws. A few years ago a state water commission was organized and an outline story of this is told by one of the members of the commission, W. A. Johnstone, representing the southern end of the state. Other members of the commission are A. E. Chandler, its president, and R. L. Riley. Ex-officio two others are members of the commission, Governor Stephens and State Engineer W. F. McClure. The northern office is at 74 New Montgomery Street, San Francisco, presided over by Josephine A. Patten. The southern office is in Room 308, Union League Building, Los Angeles.—Edit.

THE legislature of 1913 adopted a water code which takes the place of the few old codes governing the appropriation of water up to this time. A referendum was invoked which delayed the operation of the act, called the Water Commission Act, until December 19, 1914. The members of the commission were appointed in March, 1915, and consist of three active members. The governor and state engineer were named ex-officio members but neither of these very busy men have had any time to give to this work. The main office is located in San Francisco and a branch office is maintained in the Union League Building, Los Angeles, for the convenience of the people of this part of the state

The two main functions of the office are to supervise the acquisition of new water rights under appropriation and to keep a permanent record of such and to ascertain or determine in a special procedure all of such rights acquired before the act went into effect so that in the end there shall be a permanent record of water rights similar to those of land titles. The commission has many other duties and is performing useful functions in the adjustment of pending disputes and litigation and is assisting in this way in the material progress of the state both as referees and as arbitrators. It is also authorized to pass upon the progress made in carrying out incomplete projects initiated under the old codes and to supervise their completion; to make investigations in the public interest of proposed storage or other projects and to cooperate with other state and federal departments where the use of water is concerned.

California has been very much behind most of the other irrigating states in adopting an orderly system for the acquiring of title to the use of water and is one of the last few to take this step. There now remain but two or three of these states which have not adopted a water code. Because of this long delay the resultant confusion is much greater and it will take a much longer time to bring order out of the existing confusion and uncertainty. The necessity of taking such a step is clearly indicated by the fact that most of the normal flow of our streams has been taken up and in a state where there is at best but half enough water for the land that might be irrigated and that we must now proceed to conserve and use the flood waters which have heretofore wasted in the sea or desert sinks. To accomplish the fullest use of our water supply we must first take stock of what we have in order to learn whether or not any of the normal flow remains unappropriated and second to remove the obstacles to storage where this may be accomplished.

Wells Furnish a Wealth of Water for California Irrigation

A 16-inch well is handled by this one pump on the Noxen Ranch, Stanislaus County. This pump is lifting 3100 gallons per minute and three such wells furnish a supply of water to cover 1700 acres. The lift is about 60 feet.

Some Methods of Marketing Live Stock

By F. P. Allen

CALIFORNIA is an ideal locality for the production of meat animals of all classes. On the hills and mountains, sufficient range can be found to supply forage for sheep and cattle and in the valleys below, feeds to finish the stock for market can be grown. The climate, being mild throughout the winter, affords an opportunity for the stock to add both bone and flesh during this season, where in most stock raising sections, the bulk of feed in winter is required to keep the animal warm.

The rainfall in the mountains and hills provides grass in its season and the irrigated valleys supply alfalfa, cotton seed and other grains for the balance of the year. Many thousand cattle and sheep are now bred and fed south of the Tehachapi and an abundance of hogs is produced but with all this production and the ideal environment incident thereto, present marketing methods in Los Angeles and adjacent counties have outlived their usefulness. The dawn of a new era in the live stock industry brought about by the world war which has created a new outlet for the finished product will sound the trumpet to awaken the live stock man from his spirit of quiescence to demand a better market for his wares.

There is but one public live stock market on the Pacific Coast. Located in the extreme northwest section, Portland, Oregon, alone, boasts of a store to properly assemble and display these wares. These stock yards in the north are properly managed, are successful in their functions in that live stock community, and are considered as necessary in that locality as are the Kansas City yards in the heart of the corn belt.

Two great metropolitan cities on the Pacific Coast, San Francisco and Los Angeles, have no public stock yards.

Office records in possession of the local representatives of the bureau of markets, United States department of agriculture, in these two cities, prove that there is a greater need in either of these cities for stock yards than at Portland because of the greater numbers of meat producing animals slaughtered there, to say nothing of the large amount of feeders that change hands through the medium of brokers in both cities.

In all lines of commercial activity business methods are being modernized to keep pace with and surpass competitors who seek enlargement of their volume of business, and the time has actually come when it is a case of the survival of the fittest, who shall hold their place among modern business men.

In the days gone by the itinerant merchant carried his pack of wares on his back, displaying them at your doorstep. He was successful in his small way, but a few years later he opened a large store on the corner of one of the main streets where he could properly display and bring out the qualities of his wares. He saw where better marketing methods would increase his sales, accord him larger profits and create a demand before unknown. The present methods of marketing live stock in Los Angeles are easily comparable to those of the itinerant merchant, but the time has arrived when we need a store, a stock yards to properly grade and display the product to the buyer. There will be competitive bidding. New outlets for various and sundry classes now unknown will appear. It will be the means of expanding the live stock industry far more than any other agency.

Local slaughterers now secure their supply of stock direct from the producer when it is possible, by sending a shrewd buyer who is an expert judge of meat animals and familiar with live stock values, to the seller in the country who is not such a keen bargainer and is not familiar with the daily pulsation of the markets. Thus

Successful Planting in Dry Weather

By Isaac F. Tillinghast

IN a country where copious rains are frequent or where water may be plentifully used so that the surface may be constantly kept moist, it is comparatively easy to make small flower and vegetable seeds germinate and grow quickly and small plants readily grow when transplanted into the open field, but in a country or season where little or no rain may be expected, to be always successful in performance these little stunts become a very different problem.

Most garden soils will crust over, if not frequently stirred, to such an extent that small seeds when covered a half inch or more have great difficulty in breaking through this crust, and in many instances perfectly good and vital seeds will in consequence fail to appear. On the other hand, if not covered with soil when planted, the surface will dry out before they have time to absorb sufficient moisture, to such an extent that they will not germinate.

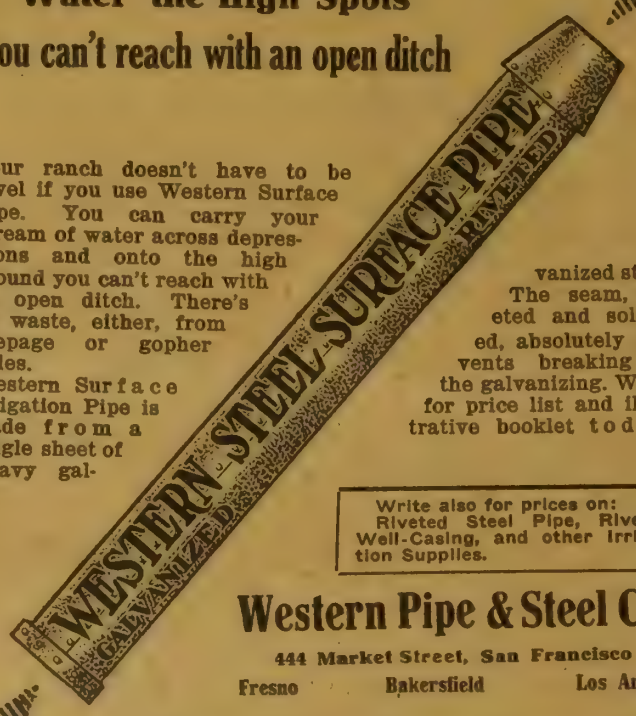
The above conditions present a serious problem to many planters, and here is the solution: First make a small furrow or mark not more than one inch deep, which will usually simply remove the dry earth and present a moist surface, on which scatter your seeds evenly, but do not cover them at all. Now make use of your feet. Walk along each row, two at a time if but a few inches apart, moving the feet forward six inches or so at a time, so as to bring your full weight on every part of the row. This forward movement of the feet will give all the covering necessary, and the earth will be compressed firmly around each seed. Now if you have water, sprinkle the bed well, and the surface will remain damp all along the bottoms of these depressed rows, even when the loose soil between them has dried out, and your seeds will all come up quickly.

Recently the writer saw a large tomato plant bed which had been sown broadcast and the seeds raked in. Then evidently some one had carelessly walked across the bed. The result was that every footprint was green with plants, while scarcely another plant could be seen, being unable to break through the dry crust which had formed, or having insufficient moisture to enable them to germinate.

To successfully transplant small green plants like cabbage and tomatoes in hot dry weather is another equally difficult problem but which may be easily performed if properly managed.

When a plant is first pulled and removed from the seed bed, many of its little feeding mouths at the extremity of the rootlets are severed, and if the plant is at once transplanted the evaporation of its moisture goes on through its leaves so rapidly that it is thrown out of balance. Its first tendency then is to wilt and die like a person who has been seriously injured in an accident. But take these same plants, dip their roots in water, or better still, "puddle" them in a solution of loamy soil and water which will adhere to them, and place them in bunches in some cool, shady place for from 24 to 48 hours, where thousands of fine new rootlets will form. The plant will now stiffen up and is ready to take hold and grow. It is now convalescent, we may say. It has changed its mind and given up the sorrowful thought of dying, and with its new determination to live, if now replanted, with its new roots placed in moist soil it may imbibe moisture faster than the evaporation goes on and be ready to start new growth at once.

And right now a little watering is a dangerous thing, for it will simply cause the surface to crust over and do more harm than good. Either water copiously or not at all, and see that the surface soil is kept broken and loose around each plant. Dry dust around each plant on a hot sunny day is a protection, but a dry crust never.



It is much safer not to try to set plants while too young and green, but allow them to stand in the seed bed until the stems are quite hard and woody. If they get too tall cover the bodies up to within a few inches of the top and new roots will form on the covered portions, which will give them greater support. If some of the larger leaves are removed it will reduce the evaporation and the plants will not wilt down so badly.

We of Northern California who sit idly by during the winter months and permit untold billions of gallons of water to flow past us back to the ocean and then measure the precious drops the next August when we want to irrigate our orchards, are about as thrifty as the proverbial grasshopper and as consistent as the Arkansas traveler. We have the winter flow of water, the sites for storage reservoirs and the summer demand, but not enough enterprise or forethought to conserve some of the winter waste for summer use. We enthusiastically subscribe millions of dollars for war's destruction, but hesitate to spend comparatively small amounts for the development of our own resources. God helps those who help themselves. Suppose we give it a try.—North California Real Estate News.

Irrigate through this pipe –

Water the High Spots

You can't reach with an open ditch

Your ranch doesn't have to be level if you use Western Surface Pipe. You can carry your stream of water across depressions and onto the high ground you can't reach with an open ditch. There's no waste, either, from seepage or gopher holes. Western Surface Irrigation Pipe is made from a single sheet of heavy galvanized steel. The seam, riveted and soldered, absolutely prevents breaking of the galvanizing. Write for price list and illustrative booklet today.

Actual Measurement for Irrigators

By E. Earl Glass, C. E.

During the past three years many water users have proven the worth of the irrigation meter as a peace maker. some companies, as the Lindsay-Strathmore irrigation district, having several hundred meters on one system. These companies have placed their water deliveries on a business-like basis and every user is assured the same fair deal. The meter shows exactly the volume of water passing through it and does its work better,

Doing Things Large

It takes power to quickly and economically prepare lands for irrigation. Here is the California way of doing things, or, more correctly perhaps, we should say, it is Yolo County's way, for this is a Yolo County scene.

year in and year out, night and day, than if one were to stand and watch his old weir box ceaselessly. And no irrigator needs reminding that his water is constantly fluctuating and he cannot afford to drop everything else to watch the weir. But that is better done by the meter for it is always on the job and more accurate than the best weir that can be built. With the meter the hired man or a boy can actually measure the water better than the best civil engineer can without it. This because the meter uses his best method, perfected by elimination of all approximations and the reduction of all calculations by mechanical means like a calculating machine.

There is surely no other commodity involving the cost to the rancher of his irrigating water that he accepts without measurement or at best only a rough approximation. If the variation were only 10 per cent of the amount received (and it is often 50 per cent or more) one may lose enough to pay for the meter in a few months.

DO IT NOW

(Continued from Page 653)

risen more, some less than the average for particular reasons affecting each industry. In some cases an improved organization of both employers and employes has enabled them to combine against the public and take full advantage of the price advance. The war brought about an abnormal demand for certain products like copper and steel, and they advanced faster than the average. The abnormal demand having disappeared, these prices are being adjusted downward.

In some cases, as in many of the industries making building materials, the war meant a great slackening in demand, an enforced curtailment in use by government order. In such instances we are likely to see an upward swing in prices as the suppressed demand again makes itself felt. Today we are witnessing throughout the country such price readjustment, up and down, but the general price level has shown little sign of falling. It is apparent to every thoughtful observer that some great force has affected all prices, creating a new standard to which they are all conforming.

The fundamental practical question confronting business men is whether the general level of prices is going to fall. In my opinion, it is not going to fall much, if at all. We are on a permanently higher price level, and the sooner the business men of the country take this view and adjust themselves to it, the sooner will they save themselves and the nation from the misfortune which will come if we persist in our present false hope.

IRRIGATION INTEREST INCREASING

Oakdale Irrigation District

The Oakdale irrigation district has made application to the Modesto irrigation district directors for a spillway into the main canal of the Modesto district at Pelton drop. The matter was referred to the president of the board and the engineer.

The engineer reported the completion of the agreement with J. T. Morehead for excavating and spreading dirt in the Jacobson ditch.

The engineer was authorized to sell an 8-inch centrifugal pump for which the district has no further use.

Application of D. M. Hackett for 1000 feet of 16-inch pipe in the Hayworth drain was granted and the engineer authorized to proceed with the work.

Six Mile Levee on San Joaquin Completed.

The six-mile levee along the San Joaquin river in reclamation district 1604 was completed this week. The building of the levee started August 10, 1918, with two dredgers on the job, which have been busy most of the time. About 3,000 acres of land in the district are under cultivation now and the crops are looking fine.

Irrigation Started at Terra Bella

"The 1919 irrigation season in the Terra Bella irrigation district started off nicely on Friday, April 18," says the Terra Bella News. "A few water users had irrigated their groves previous to that date, utilizing water from No. 3 station, where one of the two booster pumps was employed.

"All users are working harmoniously in the effort to make this a very efficient season, and it is hoped that those not yet taking water will hold to a similar purpose.

"Wednesday's run totaled 576 miner's inches of water. Eight valley wells, together with the full capacity of the infiltration gallery, are being employed in furnishing the supply. More capacity will be required, perhaps, after the first of May.

"It is apparent that the ground irrigated in the early part of the season is not taking as much water as in former seasons, and particularly is this true where the orchards have been kept clean and well cultivated during the winter.

"The pumping equipment at the several stations is doing efficient work, everthing having been put in tip-top shape before the beginning of the season.

"Riveted steel pipe for the service extensions has been slow in arriving but several carloads are promised in the immediate future. The pipe will be laid under Supt. I. H. Althouse's supervision."

Irrigating Wheat at Gridley

The Oroville Register says: "For the first time since the inauguration of irrigation in this section a large acreage of wheat is being wet with water from the canal. Many small fields have been irrigated in past seasons, but this is the first time irrigation has been practiced on the large grain ranches.

F. A. Onstott, who has a large ranch near Gridley, is irrigating 288 acres of wheat, and will finish next Monday. It is believed that the application of water means the saving of the crop, as the ground is so dry that without irrigation there would be very little matured to harvest. Many of the smaller fields have or will be irrigated soon.

"The canal company turned water into their main canal on April 15, and into the Richvale extension canal on April 21. Some of the rice growers in the Richvale neighberhood began to use the water on their crops on April 23. The rice farmers of that section can begin using water earlier in the spring because of the fact that they have drainage, a significant hint for our own section."

Garden Grove Considers Drainage

The drainage committee of the Garden Grove farm bureau reported at the last meeting of the bureau, through H. O. Arkley, chairman of the committee.

A closed tile system was suggested in preference to the open ditch system for the developed fruit sections of Garden Grove. Figures were given in approximate cost of tile of various sizes and on the cost of laying it. Conferences were held with attorneys of the drainage districts to the south of Garden Grove. It was learned that if the Garden Grove district desired to join on to the other canals, they would be assessed for 50 per cent of the maintenance charges of the old districts. The committee will report further at the next meeting. Farm Advisor Wahlberg will obtain data from drainage engineers of the college of agriculture to present with this report. port.

Flood Control Legislation

A bill has been passed by the state legislature appropriating $5000 for the purpose of gathering flood control data concerning the Santa Ana River.

Melville Dozier, Jr., of the state reclamation board and George W. Peltier of Sacramento have been visiting southern districts to learn the sentiment in regard to state control of flood conditions. Particularly they are seeking support for the proposed $3,000,000 appropriation for control work along the Sacramento.

These two bills are awaiting the governor's signature.

Support for All-American Canal

Senator Lenroot of Wisconsin has just made a visit to the Imperial Valley and on his departure announced that he would do everything possible to make official Washington accept the valley's viewpoint that federal assistance is not only desirable, but absolutely necessary.

Soils and Other Factors in Relation to Crop Production in California

The Rational Use of Nitrate of Soda in California

Acid and Basic Residues In the March 8th issue of the California Cultivator we discussed the limiting factor in crop production and the rational and irrational use of different forms of fertilizers, and the question of acid and basic residues, and of physiologically acid salts.

Sulphate of Lime and Acid or Superphosphate Even in instances of unfavorable physical soil conditions which may occasionally exist in California, such conditions can be ameliorated by the use of land plaster and acid or superphosphate, whilst merely from the standpoint of plant feeding it is advisable to use these materials in connection with sources of Nitrogen.

Early Applications of Nitrate Desirable Without doubt, in California early applications or even autumn applications of fertilizers, and especially of Nitrate of Soda, are desirable in many cases; and whenever cereals are sown in the autumn, Nitrate should be applied at the time of seeding, and in the case of spring sown cereals it is preferable to apply it a day or two in advance of the actual seeding, or just prior to the last harrowing in preparation of the land it is best of all.

Nitrate to be Thoroughly Cultivated into the Soil Generally, in rainless or very dry countries, staple crops root very deep in search of water and nourishment. When there is little or no surface water to render plant food available, Nitrate of Soda and other fertilizers should be thoroughly cultivated in at the time of application, so that the plant roots may secure nourishment during the growing season. Generally, fertilizers should not be allowed to touch the seed.

All arid soils lack Nitrogen on account of having but little humus in them, so the application of Nitrate Nitrogen helps give good crop increases.

We would suggest the use of land plaster and sulphate of lime in the formulas for citrus fruits, and especially when potash is unobtainable or too high priced.

Destruction of Humus to be Avoided In this connection, it is important to observe that care must be exercised in soils containing black alkali to avoid materially increasing the content of carbonate or bi-carbonate of lime, since this would help promote the destruction of humus.

Have your soil occasionally examined by an expert, and *do not put any more lime in any form than advised for your particular case.* In other words, take good care to preserve your humus. Do not destroy it by excessive liming on any account. Wetness, stickiness, i. e. puddling, will not result from the rational use of Chilean Nitrate, and the productivity of all soils may be increased by its correct use.

Everywhere in the world where there is enlightened experiment work, the unique qualities of Chilean Nitrate are putting it ahead of other Nitrogenous plant food.

Rational Use of Nitrate No reputable authority has ever advocated such large quantities of Nitrate per acre as would result in any abnormal accumulation of alkali. Moreover, the use of acid or superphosphate, containing as it does sulphate of lime, aids in converting any alkaline residue into harmless forms. The vast majority of soils in the United States have a tendency to grow acid rather than alkaline.

Purely Fanciful Notion that Black Alkali Comes from Nitrate The use of mixed fertilizers tends to leave acid residuals, and when acid or superphosphates are used rationally, *and in quantities suitable for proper plant feeding,* the question of Nitrate leaving abnormal amounts of alkaline residues becomes a purely fanciful one, and is not worthy of serious attention on the part of the practical horticulturist or farmer.

What an Acre of Soil Weighs An area of ground six feet deep includes practically all the active service part of the soil and, to a large extent, its chemical composition determines its usefulness. This service soil weighs on an average 2,000 tons per acre-foot. Six feet of soil would therefore weigh 12,000 tons per acre.

How Application of Nitrate Compares with Weight of One Acre of Soil Since we never recommend the use of Nitrate alone, except at the rate of from one hundred to two hundred pounds per acre, this small amount would have no material influence in increasing the content of soil alkali of so great a bulk as 12,000 tons. Two hundred pounds of Nitrate per acre is a mere trifle, hence even the continued use of Nitrate when used in rational fertilizing would not add but rather diminish the quantity of alkali in the soil, for the associated gypsum and acid or superphosphate loosen heavy clay soils which need improvement in texture and prevent black alkali accumulations.

Rational Use of South American Nitrate Advised In all our literature we recommend the rational and not the irrational use of fertilizers; i. e. normal amounts of the three elements of fertility. We always advise, when larger amounts of Nitrate are to be used, that the horticulturist or farmer use an equal quantity of acid or superphosphate.

All chemical fertilizers are capable of being used without discretion and any chemical fertilizer if thus used irrationally would naturally injure both soils and crops.

It is not claimed that Nitrate can take the place of proper soil management, good water supply, or an abundance of humus. It will not convert inferior varieties of fruits into superior ones, nor will it make a good season out of a bad one.

Eighty years of successful experience throughout the world have proved that the rational use of Nitrate of Soda is followed by larger crops, without detriment to soil conditions.

WORK OF STATE WATER COMMISSION

Continued from Page 655

what this means it may be well to give as briefly as possible some idea of the confusion in our water laws which exists mainly because of the existence of two conflicting doctrines relating to titles to the use of water and to the negligence of our legislatures in not providing adequate laws for the control or supervision of such rights. In the old days when water was plentiful and the users few and generally far between the old miner's rules were sufficient and it was during these days that our few codes embodying these rules were enacted. From time to time as the necessity arose the courts adopted rules to meet new conditions which have become a part of the law of appropriations. About 35 or 40 years ago the old English common law doctrine of riparian ownership was recognized to exist through a decision of the Supreme Court of the state in the famous case of Lux vs. Haggin over the waters of the Kern River.

Up Along the Headwaters

Near the headwaters of the Sespe in Ventura County. These waters are later taken out of the Sespe Creek and made a source of much of Ventura County's wealth in lemons, beans and other field crops.

The court itself was divided and it was decided by a four to three vote of the judges. The decision has been regarded as most unfortunate by many of our ablest engineers and lawyers. It certainly has been the cause of endless litigation and is charged with many of the difficulties encountered in putting our limited water resources to their fullest use.

The legislature has but barely recognized this doctrine to exist and indeed its efforts have been directed against breaking the monopolistic control of large riparian ownerships, which, unwilling to utilize such rights themselves, refuse to allow others who are most anxious to do so to apply these waters to their lands. In the Water Commission Act a clause provides that failure to exercise such rights within ten years from the passage of the act will act as a forfeiture of these rights. Whether or not the Supreme Court will hold such action by the legislature as constitutional remains to be seen but inasmuch as the act was finally adopted through the referendum by a vote of all the people of the state it is doubtful if the court will override this expressed will of the whole people.

As has been said before the riparian law has been entirely created by our courts. After recognizing the principle the court has had an interesting time in making it applicable to a semi-arid state where the public interest demands the taking of water from the stream to the land rather than to maintain the integrity of the stream flow, so that we now have an intricate set of rules governing both riparian rights and uses as well as the use of water under appropriation, each running counter to the other. That the doctrine of appropriation which recognizes the ownership of the corpus of the water in the state and not in an abutting land owner on a stream is much the better system for the state at large is now generally recognized but we can now only make the best of a bad situation. The riparian doctrine is peculiarly inimical to storage projects for to be useful these must be made at the highest elevation possible so that before storage can be accomplished the project must clear all the conflicting riparian claims dormant and useless or otherwise before the work can be undertaken, and this frequently, if not always, adds enormously to the cost of the undertaking. I know personally of one project the building of which has not yet begun where over three million dollars of property has been bought so that the riparian ownerships might be acquired by the project so that it might be permitted to go ahead with storage that will add very greatly to the development and progress of this part of the state as well as safeguard these very same riparian lands from a repetition of the enormous damage inflicted by the 1916 floods.

Under the present law all new appropriations must be made under the supervision of the commission. An application is filed giving sufficient data to completely describe the project with necessary maps. When this is in proper order it is advertised in order to bring out any conflict with existing rights. If the commission is satisfied that there is water available it issues a permit limiting the amount of water and fixing the time for the completion of the project with another limit for the complete application of the water to the proposed use with such other conditions as may be applicable. On the completion of the project, after necessary inspections have been made, the permittee receives a license which is in effect a certificate of title good as long as the right is properly maintained.

The procedure to ascertain what existing rights were acquired under the old law is confined to appropriations. Under the original act it was found impossible to proceed so that this machinery of the act had to be amended and this was done by the legislature of 1917.

This procedure provides for a settlement of such rights by stream systems. The first step is taken by the filing with the commission of a petition to have such work undertaken although the commission may act on its own initiative. A complete hydrographic study of the situation is then made to gather data showing all of the rights and ditches in use, showing all of the land irrigated or available for irrigation, size and capacity of ditcher and other works, power projects, etc. After this work is done all claimants are required to file proofs

of claim giving a complete history of such rights. Hearings and conferences may then be held to get such oral testimony as may be necessary. When all of the information is assembled the commission must then make a finding showing all of the valid rights with their extent, priorities and uses. This finding when completed is filed with the clerk of the Superior Court of the county where the right exists and is subject to public inspection. Any claimant dissatisfied with the findings of the commission has the right of appeal to the court and the court after hearing such appeals hands down its decree either approving the findings of the commission as a whole or with such modifications as may seem proper. In this way all of the rights on a stream system may be adjusted in one action doing away with the endless piecemeal litigation we have heretofore had. This system or method has been fully approved in suits from other states before the Supreme Court of the United States and no question is now raised as to the validity of the procedure. It has the advantage of a method whereby the evidence and date in a trial of water rights is assembled by the state itself guaranteeing to the litigant as well as to the court an impartial statement of fact with the final approval by the court itself.

The manifest advantages of such a system are very apparent but if proof is required the experiences of the states of Oregon and Nevada, our next door neighbors, which have almost identical laws, furnish ample evidence of its effectiveness. Oregon will, in the short space of ten years after the adoption of its act, have practically cleared and listed all of its existing water rights. Fortunately for this state while the riparian law was recognized such rights have been regarded as inferior to those under appropriation so that the task has been much simpler than the one before our people.

This office takes just pride in the accomplishments effected during the short time it has been engaged in this work. It has already saved many times its cost in preventing unnecessary litigation and in allowing of the early use of water which would otherwise continue to waste unused. It is acting in other important cases as referee by agreement between the litigants in order that a just settlement may be arrived at other than by a continuation of the matter through the courts. The most notable case we have to settle is the pending suit between the Spring Valley Water Company of San Francisco and the Alameda County Water District, comprising farmers and fruit growers having lands in the East Bay district south of the city of Alameda. The company is constructing a very large storage dam on the headwaters of the Calaveras Creek above the lands of the district which draws its supply from over 1200 wells on the Niles cone. A most intricate and careful study of the conditions is being made by expert engineers in the employ of the commission and it is believed that after this work is done a decision may be arrived at that will be accepted as just by both sides. Similar work is being done that will permit the accomplishment of long planned and much needed storage on other stream systems in the state. Nearly fifteen hundred applications for new appropriations have been received and acted upon by the commission and many large and important developments are proceeding throughout the state under its supervision.

WHERE CROPS CAME FROM

To the total crop value of the five years 1910-14, the geographic divisions contribute the following fractions: The North Atlantic States (from Maine to Pennsylvania), 11 per cent; South Atlantic, 15 per cent; North Central, east of the Mississippi River, 18 per cent; west North Central, 23 per cent; total North Central, 41 per cent; South Central, 23 per cent; and far Western, ten per cent. Total for the North, 52 per cent; for the South, 38 per cent; Atlantic Coast, 26 per cent; Mississippi Valley, 64 per cent; Mountain States and Pacific Coast, ten per cent. Measured by value alone, the crop importance of the Atlantic Coast is more than one-quarter of the total, of the Mississippi Valley nearly two-thirds, and of the far West, one-tenth.

Garden Irrigation

By Ernest Braunton

BOTH flower and vegetable gardens suffer more during summer from lack of thorough irrigation than from all other things combined. When growing plants and hot dry air are both pulling on the soil moisture the exhaustion is heavy and fast. A mere sprinkling or wetting of the surface, even though given every day does not get water down to the roots. A soil may be muddy on top and dry at a depth of six inches. All plants should draw their moisture supply from below, rather than from above. You must put the water down deep in the soil once each week and cultivate the surface, pulverizing it as much as possible; just as soon as it is dry enough to work.

There are some crops that also need sprinkling on top, but this should be done for spraying purposes and not be made to take the place of a thorough irrigation. Beets, cabbage, carrots, cauliflower, celery, lettuce, onions, parsnips, radishes, turnips, and many other of such classes are things that delight in water from the top. The best way to apply this is to set lawn sprinklers and allow them to run until you know the soil is well wetted to a good depth. Then every day or two spray them by hand. You should not top-sprinkle beans and peas, potatoes, tomatoes, or vines of melon, cucumber, or squash, pumpkins, etc. If you are to sow seeds do not plant in dry soil and depend upon subsequent surface watering to start the seeds. Wet the soil thoroughly first, then when dry enough, sow the seeds and rake over the soil. Then water again, lightly. But if you give this last sprinkling you must rake over surface just as soon as soil is dry enough, or a dry crust may be formed hard enough to prevent the tender seedlings from coming through. If the soil is wet enough no top-waterings will be necessary until plants are up. Irrigate in furrows and remember, plants with large tops, or surface crops, need more frequent irrigations than those largely below the surface. For potatoes, if irrigation is needed at all, it should be but once or twice, and thorough enough to soak down two feet into the soil. In gardens, a summer mulch, on crops, where it can be used and maintained, is of far greater value than frequent irrigations given exposed soils. Otherwise frequent cultivation is necessary.

REPORTS BEET SUGAR CROP OF 1918-1919

The beet sugar output of the United States for the 1918-19 season, which has just closed, was 764,867 short tons, or 1,529,734,000 pounds. This total is from the final reports made by factories to the bureau of crop estimates, United States department of agriculture, and is almost the same as last year (1917-18) when 765,207 tons were produced. The beet sugar production of leading states in 1918-19 was: Colorado, 191,880 tons; Michigan, 132,092; California, 122,795; Utah, 105,794; Nebraska, 63,494; Idaho, 44,682; Ohio, 35,476; Wisconsin, 13,358; other states, 55,297 tons.

The beets from which this sugar was made, the crop grown in 1918, were harvested from 593,887 acres and amounted to 5,890,227 tons, valued at $58,908,000. In 1917 there were 664,797 acres havested, yielding 5,980,377 tons of beets, valued at $44,192,000.

The great desirability of keeping insects reduced by modern orchard practice, as fertilization, thorough cultivation, and attention to pruning and other operations, can not be emphasized too strongly and is well appreciated by most progressive and successful growers.

Tractor Use, Profit, and Safety

TRUE progress is always slow. The change to mechanical power for farm work has been twelve years in the making, but today there are few American farmers who have not given serious thought to the question of tractorizing their farms.

For the benefit of those who may not yet be convinced that the tractor is a useful, profitable farm power machine, we present again a few of the opinions of farmers who are using the International Kerosene Tractor. Some of these are about essential features, and some mention only conveniences, but taking them altogether, almost any farmer will feel, after reading them, that the International 8-16 is a tractor worth considering.

"My International supplies a power flexible enough to handle the large amount of seedbed, harvest and other work without delay."

"It can be used for continuous work if emergency demands it."

"It produces power at much lower cost than horses, and it can be used for both drawbar and belt work."

"I like the steady way it works. Without seeming to hurry, it gets through a surprising amount of hard work."

"It does a lot of good work at a cost so low I could hardly believe it. You did a wonderful thing for Eastern farmers when you made this tractor to run on kerosene."

"It is not bothered by flies, nor by bumble bees. It works steadily on the hottest days."

"Requires very little care. When the day's work is done, I run the tractor tail first into an inexpensive shed. In the morning, I fill the fuel tank and the oiler, look into the radiator, and am ready for another day's work."

These opinions are typical. They prove at least that the International 8-16 is a useful, profitable tractor. Now consider just one other thought for a minute.

This tractor is the outgrowth of twelve years of active tractor experience by a company that has sold all kinds of farm machines for many years. The beginning of this business goes back to 1831—almost 88 years ago. Does it not seem reasonable that with this experience we should offer you a tractor that you could use with profit, especially when we expect to come back some day and sell you more of the machines listed in this advertisement?

If you are now convinced that the International 8-16 is a useful, profitable tractor on some farms, and that you don't have to be an expert to buy one safely, write us to find out what this tractor will do for you, on your farm. A post card will bring you full information.

A Car Overload is A Tire Overload

MOST cars, particularly Fords, are often overloaded. To give real service under such conditions, a tire must have very tough side walls, built of the best fabric. It should be at least its full rated size—not skimped to save cost.

HORSE-SHOE Tires for Ford rear wheels are really 3⅝" in diameter—nearly 10% oversize. The increased air space adds wonderfully to the life of the tire—it is one reason why Horse-Shoes usually double their guaranteed mileage.

Notice that you seldom see a car with only one Horse-Shoe Tire on it. Ask the owner why.

"Remember the Horse-Shoe Tread"

Fruit Crop Report Continued

THE more the season advances the better the reports are from almost every fruit section. The principal complaints as to unsatisfactory conditions are from nearer coast sections where the coolness and the moisture of the season are encouraging fungous and bacterial troubles. This is especially true in walnut growing districts, but in the main the reports being received by the Cultivator and those given by local papers over the state go to show that we are raising a bumper crop which will command exceptional prices. On this line we note this in the

Hanford Sentinel

Prices that are being offered for dried fruit on the coming crop are still maintained at a high mark and in some instances there has been an increase over the figures of several weeks ago.

As far as can be learned some of the recent prices made are 18 cents for apricots, 15 cents for peaches, 10½ cents base for prunes, and 7 cents for Muscat raisins.

In green fruit $60 per ton is offered for apricots, and $25 for Muscat grapes.

Paso Robles Press

Almond orchards around Paso Robles are showing a heavy stand of the young nuts, varying according to variety and locality from the size of peas to the size of small walnuts. Pear and prune orchards are in full blossom now, peaches have already set for the young fruit, and the fruit and nut outlook in this section has never been better.

Placer Herald

Elmer Madden, manager of the Auburn Fruit Exchange, says the prospects are excellent for a good big crop of fruit this season. Everything except cherries in spots and some early plums will be abundant, and there will be plenty of these. Mr. Madden also predicts good prices.

Lake County Bee

Nearly all the Lake County Bartletts have been sold and $75 a ton was offered last week for remaining lots. The crop indications right now are extremely good but as the fruit has not yet completely set, neither has the danger of scab passed, no one can positively state whether the crop will be normal.

Some local prunes have been bought on 10 cent basis, a raise of one cent during the past ten days.

* * *

Not all of the returns from our correspondents are yet received, but so far as received we give report in this issue in addition to the long list of intelligent estimates made in last week's paper.

* * *

Fred P. Roullard, Horticultural Commissioner, Fresno County

Present conditions indicate a normal crop of peaches, grapes, and figs. Peaches have bloomed heavily, and most of the crop has set. The cool, moist spring has caused more or less curl leaf in certain sections, but the damage so far has been very slight.

Apricot orchards have apparently escaped their usual bud drop trouble and have also set a fairly good crop. While it is too early to predict grape crop conditions at the present time, no abnormalities have made themselves apparent, and the outlook generally is good. The usual outbreak of cutworm has occurred, but the damage has not been serious. The efforts of growers to control fruit pests of all kinds have been more determined this year than ever before.

Leonard H. Day, Horticultural Commissioner, San Benito County

Apples, 100 per cent; apricots, 75; cherries, 100; peaches, 100; pears, 100; prunes, 100.

Lester C. Reed, Simi, Ventura County

The Simi Valley has a 100 per cent crop which with a number of new apricot orchards coming into bearing this year is going to make a good tonnage for the valley. I have been over most of the 'cot growing sections of the county and find conditions very much the same.

A very attractive price prevails for future deliveries, which has been accepted by a large percentage of growers, it being from 15 to 18 cents.

Wm. B. Jackson, Ontario, San Bernardino County

The apricot crop in this part of the valley will not be much more than a half a crop. There were three separate crops of bloom, the first set all right and part of the second, but the third has about all dropped off. The old trees have the lightest crop but younger trees have a little larger crop. Peaches are full of bloom and if the weather stays good there will be a good crop.

Norman G. Buhn, Horticultural Commissioner, Kern County

Almonds, apricots, peaches, and prunes have a 100 per cent set but the season is too early to tell anything much about the apple and pear crop but there is a heavy bloom on at the present time.

Up to the present time the prospects for the grape crop are very promising and we are looking forward to bumper crops.

Fred G. Stokes, Horticultural Commissioner, Lake County

Almonds, 100 per cent crop; apples in full blossom and indicate 100 per cent; pears, A-1 prospect, blossoms falling, 100 per cent crop; prunes, A-1 prospect, have just set, 100 per cent crop.

There has been keen competition for Lake County Bartletts. Prices ranging from $52.50 (three weeks ago) to $75 a ton orchard run now. Most of the pears now sold for drying purposes. Twenty cents a pound recently paid for orchard run dried pears. Pears now clean; no signs of scab.

A. A. Brock, Horticultural Commissioner, Ventura County

Almonds, 100; apricots, 85; cherries, 100.

Claud D. Tribble, Elk Grove, Sacramento County

Apricots, about 60 per cent; almonds, 40; pears, 90, most too early to estimate as the usual drop has not taken place; apples, 120; peaches, 75; prunes, 70; plums, 45, Japanese types; plums, 100, European types; cherries, 35, lightest crop in years.

Arthur E. Beers, Horticultural Commissioner, Merced County

Almonds show a very good crop although not quite equal to the promise of the blossoms. Apricots show a very good set of fruit though on the sandier lands the trees show considerable gumming and disease. Peaches show only a fair set. Pears and prunes we do not raise commercially although there is a large acreage of young trees coming on.

A. Hancock, Bakersfield, Kern County

Almonds, small acreage, crop fair, 75 per cent; apples, small acreage, crop good, 95; apricots, good average all varieties, 95; peaches, crop fair, spotted, 75; pears, prospects good, 90; prunes, prospects also good, 90.

As to conditions in Kern County fruit prospects are excellent. Peaches are a little shy on account of not blooming real good, and stormy weather at the blooming period. All other fruits are in good condition and I understand that the prices are also good, which will make a good combination for the fruit raiser.

Having just had a rain after a long continued dry spell the dry land farmers are also rejoicing, for up to this last rain it looked like an almost complete failure. The rain was too late in some cases but in the majority it will be a wonderful help.

Geo. Marchbank, Horticultural Commissioner, Madera County

Almonds, 65 per cent; apricots. 55; peaches, 85; plums, 70; prunes, 85.

Sanitary Fruit Company, Inc., Red Bluff, Tehama County

Almonds, fair, some dropping, some orchards full, others very light. Apples, prospects good. Apricots, fair, dry weather last year killed considerable number of trees, curtailing output somewhat; set is heavy. Cherries, light to fair. Peaches, heavy. Pears,

heavy. Prunes, heavy. Frost danger practically over and prospects flattering.

J. P. Dargitz, Soulsbyville, Tuolumne County

Our principal fruit up here is the apple. In full bloom now and very promising. Peaches have set well and will require thinning unless later frost prevents. Pears have apparently set a good crop. Barring very dry at present everything is promising.

G. R. Gorton, County Horticultural Commissioner, San Diego

Almonds, 100 per cent; apples, 100; apricots, 85; cherries, 80; peaches, 100; pears, 100; prunes, 90.

The conditions have been very favorable this season for the development of small fruits in our county. Of course, the estimates given are subject to change in one or two instances, as for instance, the estimate on apples might yet be affected by frost condition in the mountain country. Moisture conditions have been fairly favorable and what little frost we have had has not affected the deciduous fruits, nor indeed has a great deal of damage been done to citrus, either orange or lemon. The young lemons were considerably damaged in the early part of the month by hail which will make some difference in the later picking.

J. N. Ballantyne, Lodi, San Joaquin County

Almonds, soft shell varieties very light; probably not over 40 per cent; while later varieties run better as a rule; may make 70 per cent; apricots, are spotted but will probably make an average of 70 per cent; cherries, the Royal Annes are lighter than last year probably 65 per cent. The Tartarians are better than last and may make 65 per cent; peaches, the Lovells and Elbertas are badly affected with curl leaf and we cannot get much idea as yet how they will turn out but most others are nearly 100 per cent; pears, from reports they are better than last year about 65 per cent; prunes, from reports the different varieties are mostly pretty good and will probably run 85 per cent.

O E. Bremner, Horticultural Commissioner, Sonoma County

Almonds, small acreage here about 25 per cent prospect; apples, heavy bloom looks like 100 per cent crop; apricots, small acreage poor outlook 25 per cent; cherries, look best for years; present indications 85 per cent; peaches 100 per cent outlook; pears, 100 per cent outlook; prunes, estimate 90 per cent, old trees showing some drop, young trees full crop.

It seems to be a hard season to get land into best of condition, so that shallow rooting trees do not look up to standard. Insect and disease conditions rather severe.

J. F. Benton, Horticultural Commissioner, Humboldt County

Apples, fine bloom, prospects good for full crop; cherries, peaches, pears, good.

Winters Dried Fruit Company, Winters, Yolo County

The prospects for the coming season throughout this section are the best in many years. Our rainfall is past normal of 20 inches, the bulk of which fell since February 1, which assures sufficient moisture for the maturing of all crops. The blooming was very heavy, rains during the blooming period of almonds and apricots causing some dropping. This, however, was not serious except reducing the tonnage of almonds. The season is about one week late.

We give below estimates basing normal at 100 per cent: Apricots, 100 per cent, or about 8000 tons green, quality good and practically free from shothole fungus. Peaches, Muirs and Lovells 100 per cent, Elbertas, 65 per cent, shipping peaches 100 per cent. Prunes, about 75 per cent. Plums, early varieties estimated at 45 per cent, late varieties 70 to 80 per cent. Almonds, Hatch varieties 65 per cent, Drakes 85 per cent, Peerless 50 per cent, miscellaneous 60 per cent. Prospects look favorable for figs, grapes and pears.

A. Everett, Moorpark, Ventura County

The apricot is the only stone fruit raised for commercial purposes here.

More evidence of Samson supremacy!

Big institutions—concerns that demand the utmost in tire service—are frankly and enthusiastically indorsing Samson Tires. The Samson is gaining an ever-widening circle of friends because of its rugged giant-like strength and its seeming imperviousness to terrific road punishment. After all, the life of a tire depends greatly upon the grade of materials used in its construction. No wonder Samson Tires live long! Better materials than those which go into these scientifically constructed casings DO NOT EXIST.

Eleventh Annual Farm Picnic

By R. P. Royce

NO MATTER how well conceived one's ideas may be as to what a real picnic is, they are bound to be shattered by the annual picnic held at the University Farm by the students of that institution.

The youthful mind is active, no mistake, and when several hundred youthful minds are set to working on one proposition it is hard to predict just what will happen. In the case of the eleventh annual University Farm Picnic held at Davis April 26, such wholesale youthful mental activity resulted in staging just about the biggest affair ever held in the state.

Eleven years ago the few students attending the farm school invited a few of their relatives and friends to visit the institution and see what was being accomplished. Last year 18,000 visited the farm—each year has registered an increase—and it is probably true that considerably more than 20,000 visitors traveled to Davis last Saturday. No one knows just how many were there, but every one knew that several thousand automobiles were parked on the ground—and that most of the cars came loaded to the guards.

The event is more than a picnic. The word "picnic" does not seem to properly fit the occasion. The affair has really become an important agricultural institution in this state—a day set aside for thousands to visit the Farm, learn of the wide range of work carried on, the many practical experiments, to receive the inspiration of better agriculture, to meet their friends and to have a day of pleasant recreation.

During the forenoon the visitors were taken on a tour of the 100 acres, through the fields and orchards and vineyards, the experimental plots and gardens. One of the morning features that no one overlooked was the opportunity to visit the various barns and see and study the many breeds of live stock kept for instructional work. Each barn houses some of the finest live stock in the West and rather frequently some animal of national prominence.

Paying Homage to Live Stock Aristocracy

The parade of pure breds and of floats showing the activities of the University Farm and to an extent of California agriculture. This is a great feature of the annual University Farm Picnic. In this photograph the parade is passing the dormitories. The greater crowd is usually massed near the administration building. Thousands of California ranchers received an inspiration to raise better live stock from this parade.

Each department staged demonstrations of the work carried on. There were demonstrations of field crops, cereals, methods of dipping and grading seeds, orchard management, including latest methods of pruning and spraying, modern veterinary practice, up to date creamery practices, the latest irrigation facts, exhibits of all sorts of agricultural machinery.

Stock judging contests open only to boys having had no previous training, and athletic events occupied a portion of the morning hours.

The afternoon feature was a parade of live stock and floats that in point of interest and attractiveness would rival any circus parade.

Other interesting events of the afternoon included a ball game, flying demonstrations, speech making and a band concert.

Sorghum on Alkali Land

A subscriber having alkali spots on his place wishes to know as to growing roughage for his dairy on this land and asks as to which of the sorghums is the most resistant to alkali. The matter was referred to Professor John W. Gilmore of the University of California, and he gives us the following:

Both our experimental data and observation seem to indicate that there is very little difference between the saccharine and non-saccharine sorghums as to their actual resistance to alkali as found under field conditions. It does seem, however, that when moisture is a limiting factor the non-saccharine or grain sorghums will do better than the saccharine varieties. This is due probably to the fact that the grain sorghums are more drouth resistant than are the saccharine sorghums and under similar conditions of alkali, if moisture is deficient, the saccharine sorghums will suffer most. Under optimum conditions of moisture and where alkali is not too abundant to inhibit growth the saccharine sorghums are best for silage. They yield more heavily and on the whole, pound for pound, when seasonably cut carry as much as or more nutrients than the grain sorghums.

Among the grain sorghums it would seem that Milo is superior under alkali conditions to the other varieties, mainly, however, because it is of more certain germination when planted early, and this early planting enables it to germinate in a weaker concentration of the soil moisture and consequently to get its roots distributed in the soil before the concentration of the alkali becomes too severe. Among the saccharine sorghums there seems to be no difference between Early Amber and Orange.

We have no accurate data regarding the percentage of alkali in the soil which the sorghums will withstand because their tolerance of alkali depends upon so many conditions which are normally found in field soils, thus the kind of alkali, the percentage of moisture in the soil and its moisture retaining properties, especially in the early stages of growth, and the type and physical condition of the soil are all important yet available factors. It seems, however, that all things considered more than four-tenths of one per cent of total salts on a dry basis

would be risky. This would be especially true if either chloride or carbonate predominated. Where irrigation is practiced, by which the concentration of alkali can be kept weak, the crop will come through even a larger percentage than that indicated.

In the question of alkali tolerance of crops every field is a problem in itself and the question can be answered only by a trial on that field, but as indicated above four-tenths of one per cent of total salts may be taken as the point beyond which the farmer assumes considerable risk in getting a satisfactory crop.

A FIVE-MINUTE SPEECH

By the Hon. Henry van Dyke, Formerly Minister to the Netherlands, Chairman New Jersey Branch League to Enforce Peace

We are face to face today with a glorious opportunity and a great responsibility. In the first of these America may have a share if she will. In the second she must bear her part whether she will or not. The fact which has not yet been fully recognized by all our people, not even by all our senators, is that the United States is morally and socially responsible for the establishment of a league of free nations, pledged to uphold peace rather than war in the settlement of international difficulty.

The question which meets us now on the road of destiny is whether we Americans are willing to take a manly part in making the world safe for peace by common action with the nations who are nearest to us in spirit, in laws and in ideals.

Democracy's Responsibility

In these last four years of dreadful and decisive conflict God has given great power and consequently great responsibility to democracy. A thing without parallel in human history has happened. The strongest and best equipped autocracy of the world, the greatest military force for evil that mankind has ever seen, has been beaten down and broken to pieces by an alliance of free democratic states fighting for peace against war. The victory has been complete.

What can a league to enforce peace really accomplish, if the greatest democracy of the world, the United States, selfishly holds aloof from it, refuses to favor it, declines to bear her rightful share in its obligations and so forfeits her claim to a part in its rewards. The power which God has given to us is not of one talent, but of ten talents. All the more shame and disgrace to us if we hide it in the napkin of indifference and bury it in the deep hole of blind and selfish greed. For that sinful action, if we commit, God and our fellow man will hold us responsible.

Debt to Our Soldiers

We are responsible for our entry into a league of peace to our brave soldiers and sailors who helped to win this war against war. How gloriously they fought! How much we owe them!

Our boys in khaki and blue have faced danger and death beside the Allies to put an end to war. If we rob them of the prize for which they fought, we make their victory vain. We must keep faith with them. We must do what we can to insure what so many of them died to win, by taking our part in the League of Nations to Enforce Peace.

The United States is responsible for a hearty support of the League of Nations idea because it represents the principle to which we practically pledged ourselves when we entered the war beside our brave allies, Great Britain, France, Belgium and Italy. They counted upon us, they welcomed us as representatives of just this idea, namely, that the war of 1914, begun by Germany, was in itself a crime against the world involving consequent crimes of cruelty and barbarism and general atrocity by which at last America herself was invaded in her sovereign rights and attacked in the lives of her citizens.

It was to make the world in which such crimes should be, if not absolutely impossible, at least more difficult and more dangerous in the future, that we took up arms at the call of the President. For many years America has been on record as desiring, advocating and urging peaceful methods of conciliation and arbitration in international disputes. We want to make a world of peace because we know that in such a world democracy will be more safe and more flourishing.

SUMMER SESSIONS

The University of California is sending announcements and outlines of courses for the summer sessions in Berkeley and Los Angeles. Both these sessions begin on June 30 and end August 9.

The University held its first regular summer session in 1900, though summer courses in several departments had been given during the years 1891-99. In the summer of 1918 there were, in Berkeley, two terms of the summer session, of six weeks each. In the first term the total enrollment, not including the summer school of surveying, was 3479; 2708 came from California, 723 from other states, 41 from foreign countries; 1705 were teachers. In the second term the enrollment was 594. In the southern division of the summer session, held in Los Angeles, the enrollment was 630.

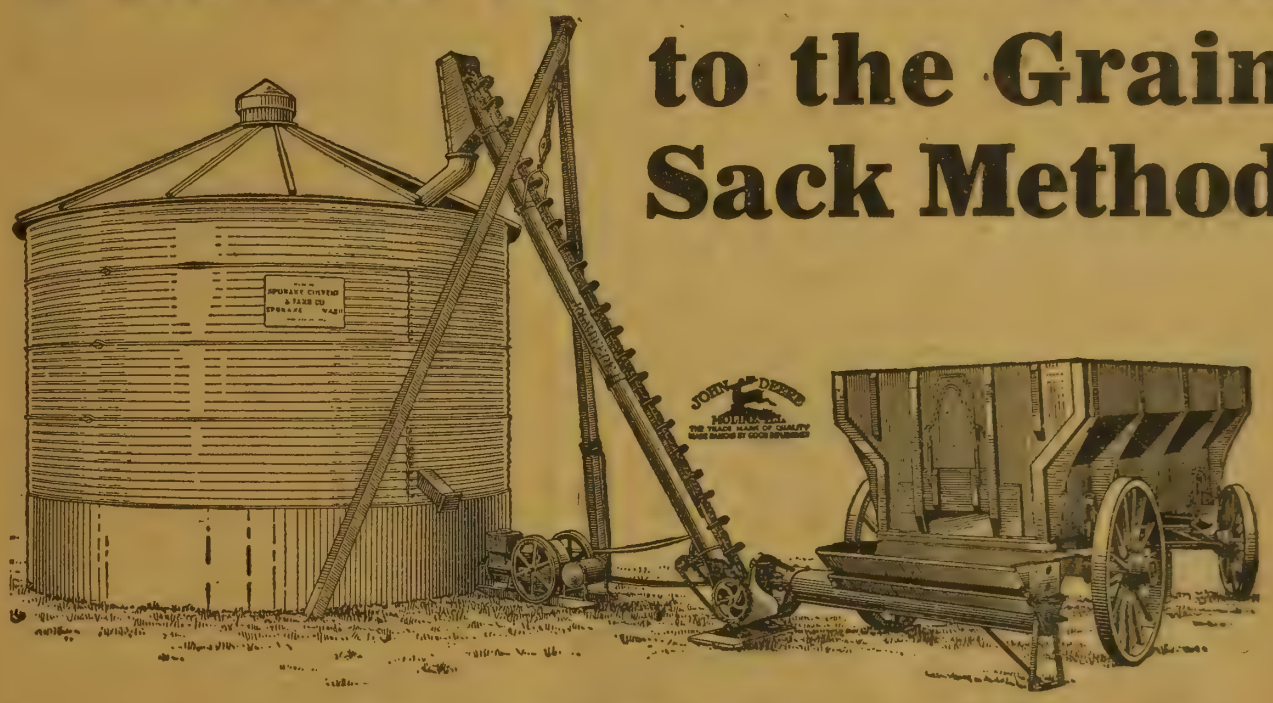
COST OF COTTON PRODUCTION IN ARIZONA

From a questionnaire sent out by the county agricultural agent of Maricopa County the following figures on the cost of cotton production have been obtained.

"One hundred and five replies were received. The average cost of plowing the land as reported by these 105 growers was $6.20 per acre; disking and leveling, $1.50; planting, $3.19; chopping, cultivating and hand hoeing, $16.28; water and irrigations, $6.82; seed, $1.25; picking 1200 pounds of seed cotton at three cents, $36; hauling to gin, $1.50; ginning at $15 per bale, $10; miscellaneous, $3.50. This makes a total of $82.54. Rent may be figured at $30 to $35 per acre, making a total of approximately $115. It is interesting to note in this connection that the average yield of the 7900 acres represented in the answers averaged as above was 1200 pounds of seed cotton. This would have given a net profit of just about $75 per acre at present prices for lint and seed."

IRRIGATING BLASTED CLAY

The difficulty in getting water properly distributed through heavy soil can be overcome to a large extent by subsoiling with powder. Heavy soils actually are always more productive than light soils when once they are made properly granular and mellow, but large areas are passed by in favor of less valuable sands and silts every year.



Proper blasting opens and fines any dry soil to almost a sandlike structure. To keep it so, and to bring about the desired granulation and organization, the introduction of organic matter is required without delay. This is easy to secure through heavy rooted crops which provide immense bulk of humus deep in their roots and further large amounts at furrow depth from tops plowed down. In short, a clay soil properly blasted and cover cropped will let in water evenly and swiftly in sufficient quantities to satisfy anyone.

The deep loosening accomplishes other equally important objects. For instance, it lets in the air, with the result that oxidation feeds the roots extensively from the virgin supply of mineral potash and phosphorus. It insures bacterial activity by providing for drainage and moisture storage, plus the organic matter and air, and this in turn makes further drafts on the virgin fertility. By beginning a high degree of tilth, reversion to insoluble forms of plant food already available and of that applied in commercial fertilizers is prevented.

Fruit growers should be cautious when blasting clay ground for trees and blast along the lines of rows without interruption, because if this is not done water will accumulate about the roots and will have no chance to escape. When the entire area of the orchard is broken, however, or even when the ground is broken from tree to tree along the rows, the water can filter through down the grade.

Clay soil should not be plowed or spaded in spring nor cultivated after a rain until it ceases to be sticky. It is ready for working when a handful of it, after being squeezed tightly, crumbles readily instead of remaining in a solid mass.

You Will Never Go Back to the Grain Sack Method

No matter how low the cost of sacks may be, the bulk method of handling grain will always be more practical, more effective and more economical than the sack method—especially when you use the

JOHN DEERE
Tubular Steel Grain Elevator

You save the cost of sacks; you save the cost of sacking; you handle your grain in less time and with less help when you use the John Deere Elevator.

Fifteen to twenty bushels of grain per minute—that is the big capacity of the John Deere Elevator with a three to six-horse-power farm engine. You control the capacity by means of an adjustable gate in the hopper, to adapt the elevator to the power applied—a big advantage.

The hopper folds up out of the way. You drive up the load and lower the hopper—no backing of the load.

Built of steel almost entirely, there is no warping or decaying—the John Deere will last almost a lifetime. The elevator, built of 3/16-inch steel well tubing into which fit round flights, handles all kinds of small grain without wasting or cracking.

John Deere Tubular Steel Elevators are furnished in two types—the John Deere Portable, a twenty-three-foot mounted outfit, and the John Deere Pony, a seventeen-foot unmounted outfit Choose the type that meets your needs.

Cross Sacks Off Your Yearly Expense List

Adopt the bulk handling method, get a John Deere Elevator and let it save you money for years to come. We have a booklet that tells all about John Deere Elevators. Write for it today. ASK FOR PACKAGE T-34.

GET QUALITY AND SERVICE — JOHN DEERE DEALERS GIVE BOTH

The FARMER says=

"for stumping genuine GIANT has no equal"

From recent letters of ten farmers who have used Giant Powders for Stumping we make these extracts:

"1. Your Giant Farm Powders shoot the roots. 2. They have wide breaking power and less bad gases than others. 3. I get the same excellent results from them every time. 4. They are always uniform. 5. I used eleven tons and wouldn't have any other make. 6. I want to sell a lot of other powder that I have because Giant does the work much better. 7. Genuine Giant can't be equalled. 8. I don't have to use so much powder when I blast with Giant. 9. You know what we need for stumping. 10. I save money by using Giant Powders."

Write today for our free book, "Better Farming With Giant Farm Powders." It tells how to save money and get better results in stumping, ditching, tree-planting, etc.

Questions and Answers

ANSWERS BY EDITOR AND STAFF

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Sheep and Alfalfa

How many sheep can be kept on the feed cut from three acres of alfalfa? Sheep to be kept penned up, so as to conserve the manure. Also if it would be better to feed the alfalfa green or as cured hay? What other feed would they need in addition to the alfalfa?—L. C. A., Orange.

The number of sheep that can be maintained on three acres of alfalfa will depend on the size of the sheep and the stand of alfalfa. It would be safe to figure that approximately one ton of cured alfalfa hay will be required per sheep per year.

It will perhaps require more labor to feed green feed than cured hay, but if the latter is fed some provision should be made to furnish a little succulent feed Except for the lambs that were being fattened, and their ewes, little grain need be fed. Care should be exercised to prevent bloat.

Hog Feeding Question

How much milo maize will it take to make a 200 pound market hog when it is fed in addition to all the fresh cut green alfalfa the pigs will clean up? How much fresh cut green alfalfa will a pig require to maturity at eight months? How many pigs to the acre of alfalfa pasture the year round can I figure on? I would appreciate answers to the above a very great deal.—Subscriber, Ontario.

Professor J. I. Thompson of the University of California states that it has required on the average, in two trials, 4.73 pounds of milo and 3.27 pounds of cut green alfalfa for each pound of gain on pigs from weaning time until they weigh 200 pounds. It required a slightly greater area to furnish the pasture for the same number of hogs than it required to furnish cut green alfalfa, but only 4.48 pounds of grain for each pound of gain. The pigs in the pasture gained about five per cent more rapidly than did the pigs kept in the dry lot and fed the cut green alfalfa. If the alfalfa mentioned is good, an acre will carry from 2000 to 2500 pounds of pork during the entire growing season.

Mulberry Not Bearing

I have a mulberry tree of the common black variety set out four years ago. The past two years it has bloomed abundantly but every blossom drops off. Why do they do that? Will they stay to fruit as the tree grows older?—Subscriber, Covina.

No doubt your mulberry tree will set fruit as it grows older. If it does not, graft it over to the Downing mulberry. That is a prolific bearer.—J. W. W.

Satsuma Plums Drop Off

I have 12 Satsuma plum trees six years old that never bore any fruit. They blossom heavily every year, but drop off when plums are about as large as a Blackeye bean. They are now in full blossom. Would it be all right to spray them now with lime-sulphur mixture?—Subscriber, Puente.

Graft one of your Satsuma trees over to Burbank and if there are many bees in the neighborhood you will get an abundance of Satsuma plums. A graft in each tree will also do the work.—J. W. M.

The Tractor Demonstration

WE are right on the ground. We are right in the midst of it. We are in the dust, the dirt, the sweat and the noise. We are here for the Cultivator readers, that is those who couldn't come, and we are going to give them the story of this demonstration in the next issue.

The show opened this (Tuesday) morning on schedule time. It has big prospects for the six days that it will be open. The crowd surpasses anything of the kind we have seen before and we have attended all the demonstrations and semi-demonstrations during the past ten years. The hotels are filled to overflowing and the Chamber of Commerce has provided rooms in private homes and these are filling rapidly.

The whole town presents the appearance of Sacramento at fair time. All roads lead to the demonstration grounds. Busses are in demand and autos crowd the streets. Everybody is going.

We have already taken some pictures of the tractors as they are going along, tearing up the ground, dragging harrows, plows, scrapers and other implements. These will be shown in next week's issue. By the looks of things Arden Acres is going to have the shake-up of its life. It may have been here for thousands of years, nay millions, but never before did it get such a wonderful brushing up as it is getting this week.

The tents are wonderfully filled with all that can be imagined, and some that we couldn't imagine, to go along with the tractor. They contain everything from spark plugs to gang plows. Our big Tractor Number is in great demand. It is the big advertising feature of the show. We brought several big bundles with us for those who are interested in tractors, but by the way they are going they will not last through the show.

The interest taken in the tractor is greater than ever before. Farmers have been studying their catalogues and diagrams and now they have a chance to see the things they have read about. And they are taking every advantage of the opportunity. Around every tractor is an enthusiastic group of admirers. They follow the tractors over the field or watch the wonderful work from a safe distance. They endure the dirt and dust for the sake of geting better acquainted with the iron horse they hope soon to possess.

The show will last over next Sunday and if you have time take a run over here. It will pay to do it. Wait for the next issue of the Cultivator for the real story of the show.

FRUIT CROP REPORT

(Continued from Page 661)

Nearly all other fruits do well but as there is no cannery in this county it does not pay to raise them. The apricot acreage is large and heavy plantings each winter increase it. Ventura County is more sure of a cot crop than anywhere else in California (I think). For two years past we have had good apricot crops and this year promises better than either of the past two years. The trees are blooming very irregularly, some being in full bloom now while other trees of the same variety and close by are loaded with fruit the size of large green peas to bird eggs. This late blooming may drop badly. My neighbor sold his coming crop dried at 18¼ cents pound net orchard run.

M. Sharpe, Vacaville, Solano County

Apricots, 75 per cent; cherries, 45; plums, 50; peaches, 100; pears, 100; prunes, 60.

N. E. Mathews, Santa Ana, Orange County

Mr. Mathews sends clipping from an Orange County paper from which we take: "While apricots are not as big a crop in this county as they used to be, since a good many trees have been

taken out and replaced with Valencia groves, they are still a substantial crop, and the income from them in the aggregate is no small sum of money. There is indication of a good yield.

"Last year the Satsuma crop was almost a failure here. A large proportion of the trees bore no fruit at all. That fact alone may be taken as a probability of a heavy production this year.

Veterinary

Answers in this column by Dr. Wm. Petrie, 2714 South Harvard Boulevard, Los Angeles, are without charge. For immediate mail answer remit $1.00. In writing questions give full symptoms or particulars of injury of animal.
Unsigned communications receive no attention.

Lice on Colts

I have four colts, one year old, that have lice, mostly in the mane and tail, some on the body. The mane is full of nits or eggs. Please tell what causes them and how to get rid of them, what to apply and how often. —Subscriber, Encinitas.

Several remedies are used to free animals from lice and all are good if the remedy is used thoroughly. First clip the colts and then wet them all over with a solution of zenoleum or some other good sheep dip, using a teacup of the remedy to a bucket of warm water. Put a blanket on the colt until it is dry. That will make the treatment more effectual and prevent the colt catching cold. This should be repeated once a week until three or four applications have been made. Another good remedy is to rub mercurial ointment in the mane and tail. This does not act as quickly as the other method. When you have removed the lice from the colts the job is only half done. You must sweep the stables; sides, ceiling and floor; and whitewash with lime and water. Some zenoleum or crude carbolic acid added to the whitewash will improve it. Chickens often bring lice into a stable and if you have chickens their quarters should be cleaned up also and the lice driven from the chickens. As long as there are any lice about they will spread from one animal to another.

Blood Clots in Milk

I have a young cow that has one sore teat. When milking we get lumps of blood. Two or three times this has come and gone. She was all right for about seven months after she was fresh. What would you advise doing for her?—Subscriber, Yucaipa.

That is hard to cure. Clots show that the trouble is in one spot and that is hard to reach. It may be caused by a ruptured blood vessel or a small tumor that is of little account; still it may increase and become quite serious. Would try to reach it by giving medicine in the feed. Get eight ounces of the tincture of iron and give her one ounce of it in the feed or in a pint of water as a drench three or four times a week while it lasts. Iron in the blood gives it greater healing properties.

Ulcers on Cow

I have a heifer that after giving birth to her first calf broke out with sores about four inches above the hoof and on her back, just back of the hip bones. Also a spot on her belly about two by four inches is raw and has a discharge. She keeps it irritated by licking it. She was fresh about September 1 and has shown no signs of breeding since.—Subscriber, Valley Center.

Would not like to prescribe for this without seeing the cow. It may be quite serious and again it may be of little account. Would advise calling the nearest veterinarian.

Cleveland Tractor

More work, more days in the year

H. G. Saddoris of Fort Dodge, Iowa, reports that the use of his Cleveland Tractor made it possible for him to harvest his grain last Summer in half the time required when he used horses, and with less help. In fact, his 14-year-old boy operated the tractor, pulling one binder, and accomplished as much in the same time as could have been done by two horse-pulled binders, each pulled by a four-horse team.

This man, like thousands of other farmers, requires a tractor that will do a variety of farm work. A tractor—that is economical in operation

—that is built rugged enough to stand up under the strain of hard, gruelling work

—that is capable of doing the whole job from plowing to harvesting.

The Cleveland is built to supply practically all the power needed on the average farm. It is designed and built by practical men who know what a farm tractor must stand.

It is economical in its use of kerosene and oil—and is small enough to be used profitably on both *light* and *heavy* jobs.

And when it comes to the preparation of the seed bed—*plowing, harrowing, seeding* and *planting*, the Cleveland Tractor's track-laying construction enables it to go over soft, plowed ground that causes the ordinary machine to "wallow" and "labor". And, it does the work more efficiently than can be done with mules or horses. The power of the Cleveland is used to *pull the implement* not to "dig out" the tractor itself. Its broad traction surface and light weight per square inch enables the Cleveland to "step lightly," and so it *does not pack down the soil behind it.*

The Cleveland also will reap, bind, thresh, haul, drag dead weights, cut ensilage, fill silos, saw wood and do the scores of other jobs about the farm that require tractive and stationary power.

There's a great, expanding market for the Cleveland. Every day more and more farmers are discovering its real worth. Write for catalog.

The Cleveland Tractor Co.
19077 Euclid Ave. Cleveland, Ohio

Largest producer of tank-type tractors in the world

Mr. C. E. Everett of North Cambridge St., Orange, Calif., writes under date of March 17th, 1919:
"My Cleveland Tractor, bought in June, 1918, has given me every satisfaction. In my opinion it is the only tractor on the market suitable for orchard work, being easily handled, gets closer to the trees, without injury, than with horses. So far my upkeep expense is negligible, while the cost of operation is surprisingly low."

The Trade Mark of
QUALITY HOLSTEINS

Stands for an Institution, organized and operated for the purpose of

— BREEDING —

BETTER DAIRY COWS

THE CARNATION STOCK FARMS TRADE MARK is not new to the Holstein fraternity. It has been before the public a sufficient length of time to give Holstein breeders generally, a pretty definite idea as to the policies of the institution for which it stands.

The CARNATION STOCK FARMS have always bought the best Holsteins of the breed with which to improve their herds as demonstrated by the purchase of JOHANNA McKINLEY SEGIS, the only 40 pound son of KING SEGIS; CARNATION KING SYLVIA, the $106,000 bull, and AVON PONTIAC ECHO, also out of the famous MAY ECHO SYLVIA; TIETJE QUEEN DE KOL, the only 42 pound cow in the world with two 42 pound daughters; and IDLEAZE PONTIAC LASS, the highest living record daughter of KING OF THE PONTIACS.

The CARNATION STOCK FARMS, by breeding this class of Holsteins on their two large farms, one near Seattle, Washington, and the other near Oconomowoc, Wisconsin, have concentrated the best blood lines of the Holstein breed so that breeders and dairymen in surrounding states might have a place to come to buy the most practical type of Holsteins with which to improve their herds. About six hundred head of registered Holsteins are now on these two farms which serve the breed as distributing points.

FEDERAL INSPECTED HERD

The CARNATION STOCK FARMS herd, by federal inspection and special care regarding sanitary precautions, has been kept clean. Their herd therefore has not only been built up with the idea of giving breeders and dairymen generally an opportunity to buy the best of the breed with which to improve their herds, but it has also been so guarded as to make it a safe place where men could make purchases without fear of contamination. Many beginners, especially, have therefore been protected and encouraged to improve the dairy cows in their community through the policies represented by the CARNATION STOCK FARMS TRADE MARK.

Write our Seattle Office

Carnation Stock Farms

Box 1089, Seattle Washington — Chicago Office Consumers Bldg. — Box 1087, Oconomowoc Wisconsin

Carnatian King Sylvia, the $106,000 Holstein

Above Photo Taken at Age of Eight Months

Carnation King Sylvia is the son of May Echo Sylvia, who holds all the world's milk records on production from one to one hundred days, considered the best cow of the breed. Carnation King Sylvia will be given a wonderful opportunity in the Carnation herd, the largest registered Holstein herd in North America.

SOME METHODS OF MARKETING

Continued from Page 655

the seller, to begin with, is placed at a great disadvantage. Then, there being no other bidder present, he is forced to either take what the buyer offers or run a slim chance of getting a better figure when another buyer happens along, which does not always prove to be a safe plan. Under the auspices of the University of California, working in connection with the United States department of agriculture, county farm agents in Kern, Tulare, Fresno and Kings Counties have been instrumental in the organization of a farm bureau marketing association, made up of over 90 per cent of the hog producers of these counties. Since this organization has been effected the methods followed by this association have put the dealing in hogs on a plane of competitive buying and selling. Whether a producer has two head or a carload, his hogs are assembled with others at a central point convenient to the shipper, and on established sale dates are sold at public auction by the manager of the association. Packers and butchers are notified in advance of these sales and are invited to send their buyers to be present. While only a few of the packers so far respond, it has proven to be an improvement over the former methods of selling hogs. Better prices are obtained and this has been instrumental in creating an inducement to the producer to breed and raise a better quality hog and to market it at the weights most desired by the buyer. At a recent auction held at Wasco in Tulare County, there were but two packer's representative buyers in attendance and the prices bid by them were not high enough to justify a fair return to the producers. The association itself bid the hogs 50 cents a hundredweight higher than the packers' highest bid, and of course bought the hogs in the name of the association. These five cars of hogs were shipped to Los Angeles and offered to all the packers in the city, with the result that a price was secured which netted the association over $100 per car more than the price they paid for them.

The members of this same association are the pioneers in working out a plan for the establishment of stock yards in Los Angeles city. With the aid of the local representative of the live stock division of the bureau of markets, United States department of agriculture, an offer of suitable yardage space on one of the transcontinental railroads, with facilities for switching cars to other railroads provided, has been secured. The approval of the packers to this plan has also been promised.

It is intended to start the stock yards with the sale of hogs only. Two cars daily for the first week, and if success crowns their efforts each subsequent day will record an increase in the receipts until the maximum required for local needs has been reached. There are many members of this association now feeding cattle as well as hogs, who intend to market their cattle when finished in the new stock yards. "Large oaks from little acorns grow" starting in this small way and growing as the demand warrants the growth, first, receiving hogs only, later expanding to take in cattle and eventually lambs and sheep, as well as feeders, and all classes will be included.

Prognositicators have pointed out how the "octopus", the packers who have two representative killing establishments located in Los Angeles, will, if they so desire, crush to atoms the best formed plans that are intended to help the producer if it is found to work an inconvenience to them. Those and other pitfalls have all been considered. It is well known throughout the entire country that the packers (better known as the "Big Five") have an organization second to none in size and efficiency and are powerful factors in the meat industry. It is also well known that only one method can be applied in dealing with their huge organization and that is to be thoroughly organized as producers, modeled after the plan of their own organization. When it is demonstrated to the packers that their supplies of live stock that are necessary to keep their plants supplied with material to carry on their business are to be obtained through one or more of the associations of producers only and that these associations are not formed with the intent to work as a detriment to the packer but to benefit all connected with the industry, they will undoubtedly accept the inevitable stoically.

Other associations of live stock men are being formed and other counties are seeking admission to membership in those already formed, and it is but a matter of a short time when the entire southern half of the state of California will be organized, that will include fully 90 per cent of the producers of live stock.

Investigation has brought out the fact that it costs the packers from a dollar to two dollars each for every head of live stock secured by their buyers in the country. It is needless to say that they would welcome an opportunity to eliminate this cost to secure their stock. Their buyer is compelled in most cases to buy certain classes and grades of stock that do not meet the requirements of their regular trade, in order to secure their ordinary needs, especially when the producer whose stock consists of various classes refuses to sell less than his entire holdings. This disadvantage is also corrected in established stock yards, where each class of stock is graded before it is offered for sale, thus allowing each purchaser to choose and bid on just the variety suited to his needs.

Another, and a very important feature in the formation of stock yards, the financial support, has not been overlooked. Among the membership of the California Farm Bureau Marketing Association are men of high financial standing whose holdings of both land and live stock entitle them to extensive credit, who have declared their intention to support the cause on to success. Present plans are to form a stock company composed of the members of the association who ship their stock to the yards. A canvass among the membership has brought out the fact that the success of the undertaking will not be retarded by lack of financial backing.

Stock now arriving in carload shipments from the country points are weighed in at the packers' yards, without a fill, which is a distinct disadvantage to the producer. With stock yards established it is intended that all stock shall be fed just as it is done in the larger yards of the central states. It is said that during the early part of 1913 a few unscrupuolus, money mad real estate land sharks exploited a scheme that terminated in a stock yard proposition. A stock company was formed of men that knew nothing about live stock but whose sole intention was to "get rich quick" at the expense of those legitimately connected with the live stock industry. Their commercial career was short lived, but unpleasant thoughts and suspicion remained in the minds of both the slaughterers and the producers on the subject of stock yards even up to the present time. That the producers would weigh carefully all the points involved in the new project before progressing with their plans, goes without saying.

When the tentative plans of the association were laid before the local packers they too frowned upon them The packers did not hesitate to enumerate many supposed disadvantages of such a scheme.

It is common knowledge that some of the largest stock yards in the central states are either owned outright or are controlled by the "big five" packers. From the producer's standpoint this is not considered good policy, but the question is asked, will the local packers enter into the scheme wholeheartedly and give their entire support to the establishment of stock yards that they do not dominate. This question will not be fully answered until all of the plans of the association are carried out and it is demonstrated to the packer that the entire meat producing industry is to be benefited from the breeder to the distributor.

Pure Feed Bill Up to Governor

Senate bill No. 93 entitled "An act to define commercial feeding stuffs and to establish a standard therefor, providing for the branding and labeling of same . . . and providing penalties for the violation of same" will become a law and operative November 1, 1919, if Governor Stephens signs the bill passed by the senate and the assembly. The live stock interests of California will then have the protection they have sought for a number of years and will no longer be at the mercy of unscrupulous manufacturers and dealers of feeds.

The bill which was introduced, in the senate by Rigdon and in the assembly by Cummings, at the instance of the California Swine Breeders' Association and indorsed by each live stock organization, had a rather stormy and uncertain trip through the legislative mill at Sacramento. On one occasion it was passed by the senate after it had been so amended that it meant nothing to the purchaser of mixed feed. It was later amended in the assembly to provide real protection and in this form was subjected to several attacks before it received the final O. K. of the senate.

The principal provisions of the bill are as follows:

Section 1. The tern "commercial feeding stuffs" shall be held to include all feeding stuffs used for feeding live stock and poultry except the following:

(a) Whole seeds or grains.

(b) The unmixed meals made directly from and consisting of the entire grains of corn, wheat, rye, barley, oats, buckwheat, flaxseed, Kafir, milo, and light rice; provided that light rice shall be labeled "light rice" when ground.

(c) Whole hays, straws, cottonseed hulls and corn stover when unmixed with other material.

(d) All other materials containing 60 per centum or more of water.

Sec. 3. Every lot or parcel of commercial feeding stuffs sold, offered or exposed for sale or distributed within this state shall have affixed thereto a tag or label, in a conspicuous place on the outside thereof, containing a legible and plainly printed statement in the English language, clearly and truly certifying:

(a) The net weight of the contents of the package, lot or parcel;

(b) The name, brand or trade mark;

(c) The name and principal address of the manufacturer or person responsible for placing the commodity on the market;

(d) The minimum per centum of crude protein;

(e) The minimum per centum of crude fat;

(f) The minimum per centum of crude fiber;

(g) The minimum per centum of ash;

(h) The specific name of each ingredient used in its manufacture;

(i) The per centum of such ingredients as corn cobs, corn bran, oat hulls, barley hulls, rice hulls, ground light rice, alfalfa meal or similar materials, when such constitute a portion of the package, lot or parcel;

(j) In the case of poultry feeds, the per centum of grit or mineral matters they contain.

Sec. 5. Commercial feeding stuffs shall be deemed adulterated if they do not conform to analysis declared on the label or tag.

Sec. 6. Commercial feeding stuffs shall be deemed mislabeled if they are not labeled or tagged in accordance with the provision of Section 3 of this act.

Live Stock News Notes

Tulare Poland-China Breeders Active

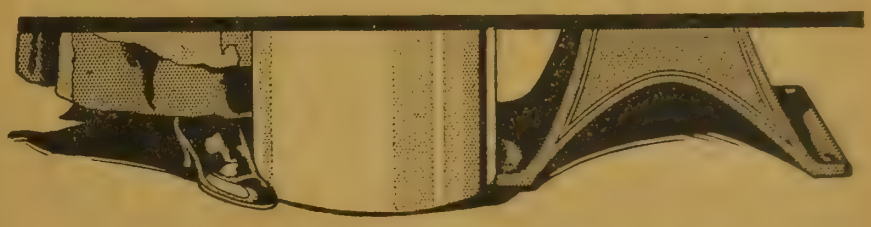
Poland-China hog breeders in Tulare County will form an association devoted to their interests. Regular meetings will be held after the organization is completed, to take up matters relating to the improvement of hog breeds in the county. The organizers of the new association will also hold a series of consignment sales of pedigreed Poland-Chinas and seek to induce more ranchers to improve their stock. Hog raising has been developing rapidly in the section, as the skim milk from the extensive dairy ranches has offered an excellent food supply and dairymen are now figuring that their skim milk is worth from 40 to 50 cents per 100 pounds on the ranch, for hog feed. Among the prominent breeders interested in the organization are King C. Gillette, of Lindsay; E. P. Fay, J. T. Boyd, John Hummel and J. K. Macomber of Tipton; Robert Smith of Pixley and J H. Hauschildt, H. S. Shinn and R. F. Guerin of Tulare.

Stock Pavilion at Tulare

Contracts have been let by the Tulare Live Stock Association for a sales pavilion and stock sheds to be erected during the next two months on property owned by the association

FOUR JERSEYS, FULL SISTERS—ALL PRODUCERS

The accompanying photograph shows a breeding example that is worth the attention of all cattle breeders and dairymen because it points out the value of a good sire through the evidence-producing Babcock test. St. Mawes was a great sire because he was capable of getting high producing daughters which fell into the hands of men who believed in the official yearly test.



St. Mawes has 20 daughters in the Register of Merit, with a yearly average of over 500 pounds of fat. One of his daughters, St. Mawes' Poppy, made three official yearly records, the highest of which was 952 pounds. Four of his daughters, shown here, are all by him out of the same dam, Susy of Forestdale, and the average production for six R. of M. records is slightly over 600 pounds of fat.

St. Mawes went the way of many good bulls—the beefsteak route, before he had a chance to prove his worth, but his record may encourage other breeders to test cows in order to discover not only the best females but the proper sire. Discovering a good sire is like finding a buried treasure on the farm.

YOU

can't afford to use a second or third grade CREAM SEPARATOR

Get a DE LAVAL

Many users make the mistake of "saving" $10 or $15 in the first cost of a cream separator. More of them continue the use of an inferior or half-worn-out machine simply because it still separates.

These users fail to consider what it means if the separation is not complete; if the capacity of their separator is so small that it needs to be run longer; if it is out of order a good part of the time, or if the quality of the product is not the very best it could be.

They fail to realize what a very little difference means in the use of a cream separator twice a day every day in the year, and what a difference it makes in first cost whether a machine lasts three or fifteen years.

All these differences led to the great majority of experienced users buying De Laval machines when butter was worth 20 cents a pound, and they mean just three times as much when it is worth 60 cents a pound and when every minute of time saved is worth so much more than it was a few years ago.

De Laval superiority over other cream separators is no uncertain quantity that cannot be seen or measured. On the contrary, it is capable of demonstration to every separator user, and every De Laval agent is anxious for the opportunity to demonstrate it.

If you don't know the local De Laval agent, write to the nearest De Laval office as below and we shall be glad to put him into prompt communication with you.

State record when made	Butter	30 days	109.23
Allenvail Clothilde Walker	Butter	7 days	26.89
Three years, State record when made			
Korndyke Segis Star Rena	Butter	7 days	26.66
	Butter	30 days	107.83

Seventeen others, over 25 pounds of butter in seven days. Mostly bred to "It," son of the first cow in the world to make over 37 pounds in seven days and over 1250 pounds the one year. What will their calves be worth? Ask yourself that question.

Daughters of King of the Pontiacs, King Segis DeKol Korndyke, "It," King Segis 11th, King Korndyke Sadie Vale 27th, King Korndyke Sadie Vale 22d and other famous sires; a daughter of Valdessa Scott 2d, 41.88, the first 40-pound cow of the breed!— the first time a daughter of a 40-pound cow has been offered at public sale in the West.

SIXTY SWEET HEIFERS, six out of 30-pound cows—daughters of King Korndyke Sadie Vale 22d and St. King Korndyke Sadie Vale 27th.

Bulls! Bulls! Bulls! Forty of Them!

The greatest, most stupendous and unparalleled opportunity ever offered breeders and dairymen in the West to buy herd sires at twenty-five cents on the dollar.

"IT" Will be Sold

King Paul Korndyke Vale, a 31-pound son of King Korndyke Sadie Vale will be sold.
King Winnie, a son of a 1200-pound yearly record cow, will be sold.
Prince Gelsche Korndyke Segis, a son of Prince Gelsche Walker and from the same dam as the $3100 heifer, will be sold.
Two Sons of "It," from Star Rena Wayne Pietertje 2d, a 34-pound three-year-old daughter of a 29.93-pound cow, will be sold.
Two other bulls from 31-pound dams, not to mention some thirty-five others.

Don't Forget the Days, May 21-22

Headquarters, Angelus Hotel, Los Angeles

Free automobiles will leave Angelus Hotel at 7:00 o'clock on the morning of the sale and at 1:00 on the afternoon before the sale, for the ranch

McAlister & Sons

Chino California

on the state highway at the outskirts of Tulare. Accommodations will be provided for 120 head of cattle and 150 head of hogs in two separate buildings. With the completion of the buildings the association will open a series of consignment sales of dairy and beef cattle and of pedigreed hogs of various types. In the fall the association will present its first county agricultural and live stock fair, with a week of displays of agricultural products and pedigreed live stock and the buildings planned are to be the first units of an extensive fair grounds to be arranged during the next year. Dairy cattle will be a feature of the sales and displays as the section is rapidly developing as a butter producing center, the butter fat payroll at Tulare last month reaching to $196,-910.62.

State Record for Milk and Butter

A new state record for combined milk and butter production was made at Tulare last week by the Holstein-Friesian Dora Walker, when the senior two-year-old produced 664.4 pounds of milk and 24.144 pounds of butter in an official seven day test, conducted under the supervision of the University of California. On her best day the heifer produced 99.7 pounds of milk and 4.24 pounds of butter. The seven day record is said to be the second highest in the world. The test was conducted at the Higdon Holstein Farm and the animal was under the direct care of H. L. Higdon's expert herdsman. The Holstein is the property of Mrs. Annie Donders of Fresno who sent the animal to the Higdon Ranch for the test. A remarkable feature of the record is that the heifer had given birth to two calves during the previous ten months and made the test after a rest of only six weeks.

Farm Bureau Hog Auctions

Farm bureau hog auctions, as developed in Tulare County during the past year have proven an unqualified success, according to C. M. Conner, country farm adviser, and the presidents of the local farm centers, which had direct charge of the sales. During the year farmers in the county sold through this method $580,000 worth of hogs, or nearly half of the total shipments made. Sales are held twice each month on regular days at the various farm center headquarters, and while at the earlier sales only two to three cars of stock were disposed of, the shipments from each center during recent months have run from seven to ten cars. As high as $18.40 has been paid at the sales and the prices during the entire time since the method of selling was adopted have run high. The county farm bureau is a member of the California Farm Bureau Marketing Association and the sales are conducted under the direct charge of J. H. Bittner of Bakersfield, general manager for the state organization. Except for a six weeks' period, the commission charged to the producer for selling his stock has been one per cent, two per cent being charged for the short period. Buyers are largely representatives of packing houses in San Francisco and Los Angeles, and the number of buyers has shown a steady increase with each succeeding sale, so that bidding has been more brisk and the prices paid range higher with each later sale. An attempt was made to auction beef cattle in the same way, but difficulties in grading the stock so that it could be sold in car lots made the sales less successful and they have been abandoned.

Guilford Buying Shropshires

W. S. Guilford of the Butte City Ranch is in Oregon for the purpose of selecting a choice lot of Shropshire lambs. Guilford is accompanied by George Phillips, shepherd at the University Farm. Guilford states that there is a very keen demand for Shropshires throughout the Sacramento Valley and that many farmers operating small tracts are finding sheep highly profitable adjuncts to their ranches.

Lendorris Polands

Lendorris Ranch, Hanford, reports the sale of a young boar by Kings Big Bone Leader and out of Grangeville Maid to the Ehmann Olive Company, Oroville.

In a letter to W. L. Haag & Son, owners of Lendorris Ranch, they state that the bred sows and gilts secured from them early in the year have proven so satisfactory that they had decided to purchase this boar to place at the head of their herd.

Witherow Selling Durocs

Greenwood Farm, H. C. Witherow, owner, Live Oak, reports the following sales: Boar pig to R. G. Sexton, Live Oak; sow pig to Harvard R. Gaines, Anderson; boar and sow pigs to C. E. Reische, Meridian, and boar pig to W. T. Bandy, Biggs.

These pigs were sired by Johnson's Defender Jr., by Johnson's Defender, junior champion at the 1917 state fair and out of the grand champion sow at the same show.

More Eastern Durocs to California

Clayton Slocum, Jr., member of H. P. Slocum & Son, Duroc-Jersey breeders of Willows, reports the purchase of the following animals on his recent trip East:

From McKee Bros., Versailles, Kentucky, he secured the aged boar, Experimental Defender, a son of Defender and out of a Proud Advance sow. Mr. Slocum states this boar has been siring some of the best animals found on the McKee farm. Another is Uneeda McKee's Defender, farrowed in May, 1918, and sired by Highland King Defender. Fourteen sows also were secured from McKee Bros., all by sons of Defender.

From Ira Jackson, Tippecanoe City, Ohio, he secured four sows by Prince Orion, Jr., by Orion Cherry King Jr., grand champion boar at the 1916 National Swine show.

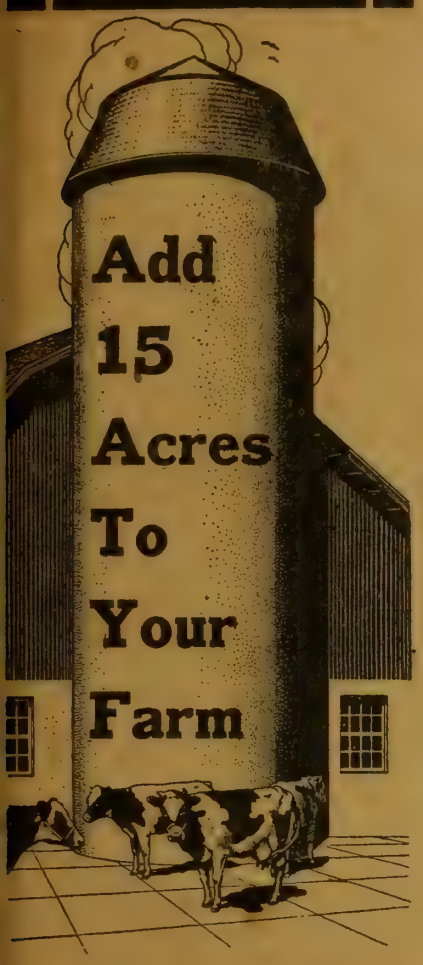
From Ray Emley, Wiser, Nebraska, he purchased two Grand Model sows and the boar Sensation Wonder 1st by Top Sensation and out of a Col. Gano sow. He also purchased three sows from Mayfield Farm, Lexington, Kentucky.

There are now on the farm about 150 pigs of spring farrow with ten sows to farrow in the next few days.

Recent sales include seven head for shipment to the Philippine Islands.

Tulare Swine Breeders Organize

On Wednesday evening, April 30, Poland-China swine breeders of Tulare County met at a banquet at the Hotel St. Maxon, arranged by the Tulare Board of Trade, and organized a county association of 25 members, electing officers and deciding to hold a full consignment sale at the pavilion of the Tulare Live Stock Association. The date for holding the sale was left to the board of directors, who will also appoint an inspection committee to pass on all stock offered for the sale. During the progress of the meeting various breeders offered 25 head of their choicest stock for the opening sale. The breeders in attendance manifested the greatest enthusiasm for the future of the breed in Tulare County and discussed extensive plans for advertising their stock and the county as a production center.



The officers elected are R. F. Guerin of Visalia, president; H. C. Shinn of Tulare, secretary; directors, F. E. Fay, Tipton, A. J. Elliott, Tulare, J. K. Macomber, Tipton, J. H. Hauschildt, Tulare, W. E. Martin, Visalia. The directors will meet shortly to draw up by-laws, appoint committees and set a date for the fall sale.

Tulare's Stock Shipments Increasing

During the past year live stock shipments in Tulare have developed from $200,000 per month to $300,000, largely due to increased production of hogs in this section. At the present time there is intense but friendly rivalry between the red and black hog men as to the respective merits of their breeds, and both groups will hold sales during the next few months, the Duroc and Poland-China association members each claiming that they will make the most notable showing in quality and price for the stock disposed of at auction. The large supply of skim milk from dairy herds and the supply of home grown feeds, aided by the better quality of stock bred is said by ranchers to be the cause of the increased shipments.

Pure Breds Sold

T. J. Gist & Sons of the Holberk Stock Farm of Tulare report the sale of ten head of young registered Holstein bulls to the following: M. Curti,

A 100-Ton Concrete Silo will do it

California Poland Futurity Fills

The necessary entries for the Poland-China Futurity Show to be held at the California State Fair under the auspices of the American Poland-China Record Association have been secured. According to the secretary 23 herds have been nominated and it is expected that all will compete.

The interest in these futurity shows is increasing each year and breeders look upon the futurity as one of the best means of stimulating the proper development of pigs.

Will Sell Shorthorns This Fall

Dr. H. M. Elberg of Woodland, proprietor of the Roselawn herd of Shorthorns, announces that he is planning to hold a public sale this fall. The Roselawn herd is one of the pioneer collections of Shorthorns in California, having been established a good many years ago by the late T. B. Gibson. The herd has always been maintained on a high level and has been the source of many cattle that have been factors in the cattle industry of the state. The proposed sale will be looked forward to with a great deal of interest.

True to Judge Island Fair

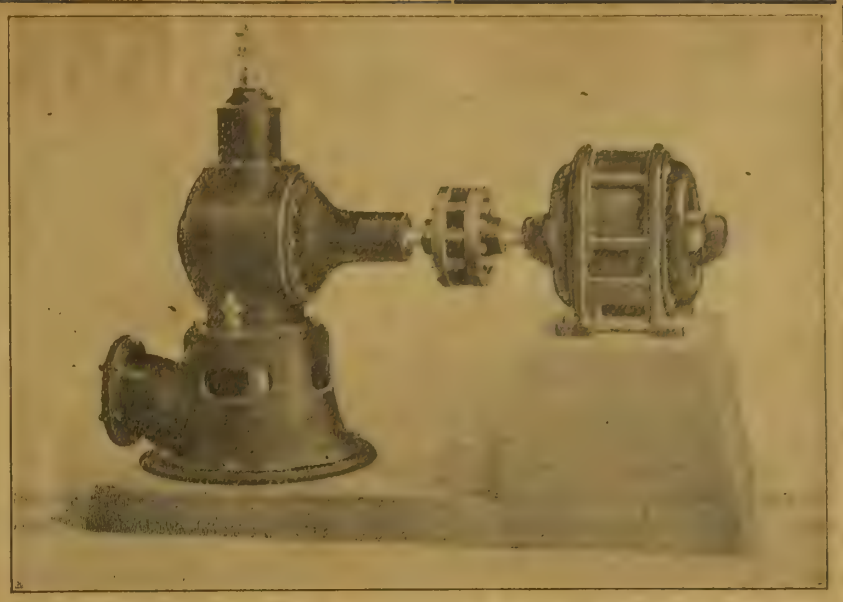
Professor Gordon H. True, head of the animal husbandry department of the University of California, has accepted an invitation to officiate as judge at the forthcoming Territorial Fair to be held at Honolulu. Professor True judged the same fair last year and his work was of such a high order that the management insisted that he return this year. He will leave the latter part of this month.

Pacific Coast Jersey Records

Among the five leading Jersey cows in each of the eight classes that were accepted by the American Jersey Cattle Club for the month of March, 20—exactly half—were Pacific Coast owned cows, and if one in Montana and one in New Mexico are counted the West makes a most unusual showing. Furthermore of the eight classes, five are headed by Pacific Coast cows.

Record Angus Sale

One of the most notable Angus auctions ever held in this country occurred April 15 and 16 when F. J. Roberts of Atlantic, Iowa, sold 87 head of bulls and females for an average of $1401. Epitos, a former International champion, sold for $15,200, and the cow Blackcap 72d sold for $6050.



NEED FOR GUARDING AGAINST FOOT AND MOUTH DISEASE

A recent outbreak of foot and mouth disease in England, now believed to be confined to the immediate neighborhood, is cited by officials of the bureau of animal industry, United States department of agriculture, as an illustration of the virulence of the malady and how the most aggressive steps toward its control are necessary. The experience in England is a reminder of similar outbreaks in the United States. This country is now free from the disease, but all persons are urged to be eternally on guard and ready to report any suspicious cases to government officials.

As soon as the disease was confirmed on January 9 by the board of agriculture of Great Britain, an area of 30 miles surrounding the infected district was quarantined, and no animals or straw, fodder, hay, manure or similar products were allowed to move in or out of the quarantined territory.

Diversified farming should become more general, to the end that each farm shall produce the necessary food for its family and the necessary feed for its live stock.

Put quarters which might be spent foolishly into War-Saving Stamps; back up yourself with cash and back up your Government in cleaning up the war.

Do Cow Testing Associations Pay?

By J. A. Robson

THE opening of the year 1919 sees the dairymen of the North California coast section lined up in favor of the cow testing associations, two such organizations having been formed in Humboldt County during the month of February. The Ferndale Cow Testing Association, organized by the dairymen of the Eel River Valley in 1909, and the first association of its kind in California, has rendered a remarkable service during the past ten years, and the carrying off of many of the prizes by Humboldt dairymen in the state contests of recent years is attributed directly to the Ferndale organization. The two new organizations designed to carry on this good work are the Arcata Cow Testing Association and the Requa Cow Testing Association, serving the interests of the dairymen of the Arcata bottoms and the Klamath River sections respectively.

The two most highly developed dairying sections of Humboldt County are the Eel River section, said to have more cows to the square mile than any spot in the world, and the Arcata district, comprising the rich bottom lands lying between Eureka and Arcata and along the stream beds of the Mad and Little Rivers. The dairymen of this latter section have hitherto been served by the Ferndale Cow Testing Association, a certified tester being sent once each month to test out certain of the herds. This necessitated a drive of 35 miles from headquarters, and the result was found unsatisfactory to the Arcata owners because of the fact that the credit for their prize winning herds went to the Eel River section by virtue of the fact that the cows were entered by the Ferndale Association. It was accordingly deemed advisable to form a separate organization which would be able to serve not a few but all of the dairy farms in the Arcata district.

Frank Falor, who has recently been doing cow testing work near Sacramento, was engaged to do the testing by the following board of directors at a meeting held in Arcata February 19: Daniel Turner, chairman; Iver Iverson, Vinol Hunt, James Kirkpatrick and Joe Ramos. There are already 1500 cows signed up for testing and active work began on the first of March.

The following are the officers of the cow testing association formed in Requa in February: P. C. McBeth, president; J. R. McMillan, vice president; E. C. Lockwood, secretary; A. W. Green, treasurer; directors, M. Delponti, Paul Bravo, Mrs. Peirri, Mrs. Von Albensleven and Mrs. McMillan. This organization already has 800 cows signed up for testing. Work is expected to begin the early part of March, word having been received from the agricultural college at Davis that a tester had been secured.

The dairymen of the Humboldt section are ardent advocates of scientific testing for butter fat as it has already been proven that the success of dairying from a financial standpoint depends entirely upon this point. The effect of the Ferndale Association has been to weed out the "boarders" from the herds with a subsequent improvement of the blood of the herds. Following the findings of the testing association, the Humboldt County Dairymen's Association has urged the using of pure bred sires in bringing up the standard of the herds until today some of the finest herds of Jersey, Guernsey and Holstein-Friesian blood are to be found in this section. No less an authority than Hugh Van Pelt of the Waterloo Jersey Farms of Iowa spoke of the Humboldt district as the coming Isle of Jersey. That this prophecy may be realized in the not distant future is indicated in the fact that the value of the dairy products of Humboldt County for the year ending September 30 approximated $6,000,000, with second place accorded by the state dairy bureau for butter production with a record of 5,717,406 pounds.

While this region is a natural dairying country, with green pastures practically 365 days in the year, the success which is piling up fortunes for Humboldt dairymen is due in no small measure to the fine spirit of cooperation existing between men of widely differing nationality and the scientific basis on which their business is conducted. The large creamery plants of the district take care of the market end of the business, the problem confronting the dairyman being how best to market his crops through the medium of his cows. The construction of modern silos, proper feeding and housing condition and the breeding of pure blood stock are some of the things that make cows in Humboldt pay.

FOR AN ANNUAL LIVE STOCK WEEK

Representatives of the California Cattlemen's Association, the California Swine Breeders' Association, the California Wool Growers 'Association, the California Jersey Cattle Club, the California Poland-China Association, the Western Berkshire Congress and the Pacific Coast Hereford Breeders' Association met at the University Farm April 26 and discussed the advisability of holding an annual live stock week at the University Farm.

It was the unanimous opinion that such a week would prove of great benefit to the live stock interests and it was decided to urge the University authorities to inaugurate such a plan. It is expected that such a week would provide a rare opportunity for each of the various associations to hold their meetings and sales and to discuss and solve their mutual problems.

Professor Gordon H. True stated that he felt sure the University would welcome such a plan and be more than willing to invite men of national prominence to meet with the local interests.

The time for holding these meetings was left open until all concerned could reach a decision that would be satisfactory to all.

HAMPSHIRE SECRETARY TOURING CALIFORNIA

E. C. Stone of Peoria, Illinois, secretary of the American Hampshire Swine Record Association, is visiting the breeders of the state and making a careful study of the live stock possibilities of California.

Stone is enthusiastic over the outlook for Hampshires and predicts that the fall shows will bring out the greatest line-up ever seen on the Coast.

Stone is of the same opinion voiced by many Eastern live stock experts that when once this state really hits its stride other live stock sections of the United States will need to look to their laurels.

"California has tremendous advantages over any section I am familiar with," Stone said. "Out here you can grow in abundance the kinds of feed needed, and your live stock can grow every day in the year. And for those reasons you can get more size for age than Eastern breeders."

DEPOSIT YOUR SORGHUM CASH IN SILO BANK

G. S. Ray of the Colorado agricultural college says a sorghum crop when put in a silo will yield interest like money in a bank. Here are his reasons:

"Silage is the most economical form in which to utilize sorghums.

"Sorghums are more productive than corn in many of the plains counties.

"Sorghum silage ranks next to corn silage in feeding value.

"Sorghums have a great resistance for dry weather and drouthy conditions.

"Sudan grass, amber sorghum, kafir, milo, and feterita may all be siloed.

"Soil for sorghums should be prepared the same as for corn.

"Sorghums are a hot weather crop and require a warm soil before planting.

"Seed sorghums in rows so as to permit cultivation.

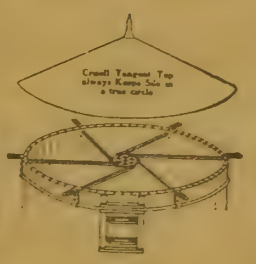
"Sow six to ten pounds of seed per acre.

"Silo sorghums when the seed is mature."

The Clear Strength

Of The Giant Pines

Is built into the Simplex Silo



One-Piece Oregon Pine (Douglas Fir) Staves are used in the Simplex. Not even the 40-foot lengths are spliced. That makes the Simplex strong, air-tight, watertight.

The Simplex Interlocking Anchoring System

binds roof, staves and foundation so rigidly together that winds cannot wrench them loose. It does away with all possibility of vibrating, twisting or collapsing, and insures permanency.

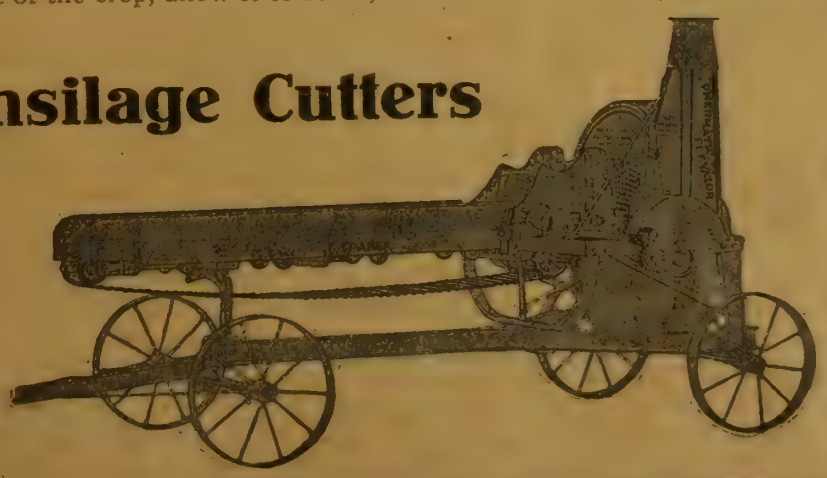
Crissell Top Maintains True Circle

Final protection against all strains insured by the Crissell Tangent top device. It keeps the Simplex in a perfect circle. Staves cannot creep. Silage in a Simplex settles evenly and sticks close to the walls.

These are reasons why farmers all over California are investing in

Simplex Silos

There are other reasons, too. You should know them. Sooner or later you will build a silo. Get all the information you can on the subject. Write for our illustrated folder, which explains in detail every feature of the Simplex. Let us answer any questions you care to ask. We shall be glad to co-operate with you and give you the benefit of our years of experience in building silos to meet every requirement.



SANTA FE LUMBER CO.

18 California St., San Francisco, Cal.

Fill Your Silo Right

Get the best possible use of your Simplex by filling it yourself. Put in a part of the crop, allow it to settle, then fill to the top again.

Papec Ensilage Cutters

are built as strongly as Simplex silos. They are inexpensive to run, handy to use. Mail that coupon in the corner.

MAIL THE COUPON NOW

SANTA FE LUMBER COMPANY,
18 California St., San Francisco, Cal.

Please send me folder describing Simplex Silos; also information about Papec Ensilage Cutters.

Masterpiece, Longfellow, Robin Belle, Rookwood, Duchess and Rival's Champion's Best Strains. Fine individuals of both sexes — we pay registration fee.

Careful attention given to mail orders.

Whittier State School

Whittier, California

What is a Shorthorn Bull Worth?

If a registered Shorthorn bull during his life sires 100 calves worth $50 more per head than calves from the same dams by a scrub bull he is worth $500. If they sell for $10 more he is worth $1,000. If $20 more, he is worth $2,000.

But suppose they sell for $50 more—what is he worth? He is actually worth $5,000 in gold.

It will pay you to use a high class Shorthorn bull. He will cost much less than his value.

You get paid for quality and pounds both at the beef markets. Many a 1,600 pound Shorthorn cow yields from 7,000 to 10,000 pounds of milk per year.

The Monroeville Berkshire Sale

The sale of Berkshire pigs at the Monroeville orchard of the Superior California Lands Company on Thursday, May 1, 1919, was a successful event. While the prices were low, considering the quality of the offering, the sellers were satisfied and the buyers bought the animals at bargain prices. An opportunity to buy Berkshires of the best breeding at little better than pork prices was overlooked by many farmers, but those who were fortunate enough to be there were the gainers. Although the crowd was small, all of the hogs offered were sold.

Sixty-seven head brought $1449, an average of $21.62. The benefit of this sale to the industry in this district will be very great, because the animals sold went to a lot of good herds. The sale was conducted by Chas. L. Hughes of Sacramento and Col. Rhoades of Los Angeles. The buyers were C. L. Leonard, Chas. Glenn, Frank Glenn of Glenn, G. A. Murphy of Sacramento, Anchorage Farm, Orland; A. Plato, Willows; Elder Creek Ranch, Tehama; E. H. Cameron and H. A. Marchand, Willows.

Two Great Records Made at Higdon's

Harry L. Redd, herdsman for W. J. Higdon, Tulare, California, is setting a fast pace with the good registered Holstein cows under his care and has developed two more splendid record makers. The first of these is Betsy Lamb Prilly, owned by H. E. Vogel, Fresno, and sent over to Higdon's place to be put on test and then bred to the $6500 bull King Korndyke Pontiac 20th. It will be remembered that this great young cow made over 32 pounds butter in seven days last year as a four year old. This time she came back with an official record of 35.03 pounds butter from 743.3 pounds milk in seven days.

The second big record was made by the great heifer Coloma Beauty Butter Maid, who made 34.77 pounds butter from 576.3 pounds milk in seven days as a junior four year old, second highest record in state in class. It will be remembered that Mr. Higdon purchased this heifer in the 1917 Guaranty Sale at Sacramento from his neighbor Alex Whaley of Tulare, who bred the heifer and made a record of over 19 pounds butter with her as a senior yearling. Her dam is Coloma Johanna Hartog, a 28.63 pound daughter of King Pietertje Hartog, who was purchased in the same sale by McAlister & Son, Chino.

Another nice record just made in the Higdon herd is that of Lady Pontiac Holingen Jewel, a junior two year old daughter of King of the Pontiacs 14th. She made 21.90 pounds butter from 463.4 pounds milk in seven days.

More Good Shorthorns to California

In a recent letter from W. M. Carruthers, who is now in the East visiting the leading breeders of Shorthorns, he states that he has selected a number of choice young bulls that he will bring West. One, a white senior yearling by the C. F. Curtis bull, Knight Avon, and out of a Ury dam, is said to be an exceptional herd bull prospect. His sire stood second in the aged class at the last International. The calf is a grandson of Count Avon, sire of Carruthers' former herd bull, Count Glory. Two sons of the well known Tomson bull, Maxwalton Rosedale, were also selected. One, a red, is a full brother to Rosenthal's and Howell Rees' herd bulls. He is from a Victoria dam that is rated as one of the greatest living herd bull producers. The other is a roan from the same dam as the two year old heifer shown successfully last year by the Ormondale Company of Redwood City.

A fourth calf, and an exceptionally well bred one, is by a son of Fair Acres Sultan and out of a Jilt cow that produced the grand champion cow shown by Carpenter & Ross at the 1916 American Royal.

Carruthers also selected a son of Beaver Creek Sultan, and out of an imported Bruce Clara dam. Beaver Creek Sultan is counted one of the good bulls of the Middle West.

The Shorthorn interests of this state will be greatly strengthened by the acquisition of such popularly bred bulls. It is probable that some of the bulls will be offered as attractions in the sale Carruthers will hold July 10.

Grade Holstein Brings $400

The James McGillivray sale of Holsteins held at Sacramento was more than a sale—it was a demonstration of what can be accomplished when sound dairy practices are applied in a persistent and common sense way. If every dairyman in California who is using a grade bull or an inferior pure bred could have been at the ring side he would have been given one of the most convincing lessons possible and so plain could the lesson have been made that what they learned would have been worth much to the dairy interests of this state. The whole sale was proof positive of the value of good sires.

For over 15 years McGillivray has been using high class pure bred bulls in his herd. During the same time he has been developing a herd of pure breds. With both pure breds and grades he followed the practice of carefully testing and culling, keeping only his best heifers.

From year to year the herds grew and finally the point was reached when all grades could be replaced by pure breds—hence the sale.

But the interesting point in connection with the sale was the selling of a grade cow for $400; 10 grade cows for an average of $330; 25 for an average of $262 and 100 head for an average of $177.50; 154 for an average of $161 and 230 head, including many heifers and calves, for an average of $142. Six grade daughters of the famous bull King Mead of Riverside averaged $331. Fourteen registered Holstein bull calves were bargains at $240 each.

When 100 grade cows can be sold for an average of $177.50 there must be a reason. Of course there is a very active demand for most any sort of cows, but the difference between $125 cows and $177.50, $262, $330 and $400 cows can be traced to the use of good bulls. Need more be said?

The sale, which was one of the most successful ever held in this state, was under the management of C. L. Hughes of the California Breeders' Sales and Pedigree Company of Sacramento, and Col. Ben A. Rhoades of Los Angeles sold the offering—part of the offering—for his son, Harold Rhoades, took the block in the afternoon and displayed most unusual auctioneering ability.

The principal buyers were: Smith & Blanchard and Walter Hauck of Chowchilla; Frank Guernsey, Stockton; J. Francis O'Connor, Santa Rosa; R. D. Jones, Woodland; William Watt, Napa; H. C. Muddux, Sacramento; Frank B. Anderson, Sacramento; H. L. Plyman, G. M. Plyman, Mrs. J. W. Herrington and T. A. Edinger of Hood; E. Coker and F. H. Harvey of Galt.

England is planning to award the order of merit for horses which have seen service in the war and are returned to civilian occupations. The Blue Cross fund will issue this recognition—a special badge, a design for which is now under consideration. It is hoped that it not only will distinguish those horses which have done their bit but also will serve as a reminder to their owners and drivers to accord them generous treatment.

SPLENDID COOPERATION AT DURHAM

One of the finest examples of true cooperative spirit ever brought to our attention was recently related by George C. Kreutzer, superintendent of the State Land Colony at Durham.

It is part of the plan of the settlers to give live stock a large place in their operations and at the outset it was mutually decided to adhere to one breed of dairy cattle and one breed of hogs. By following such a plan of community breeding it is expected that the colony will eventually develop as a recognized live stock center. The settlers formed a live stock breeders' association and elected to handle only Holstein cattle and Duroc-Jersey hogs.

So anxious were the members to get started, and finding it difficult at the time to secure the required number of cows, many began picking up a few head as they could be located. For the most part the start was made with one cow, although a few put in more.

Unfortunately, few if any of the cows purchased had been tested for tuberculosis. At one of the meetings held by the association the subject of tuberculosis came up for discussion and after thoroughly considering every angle of the problem it was unanimously decided that the colony would declare for clean cows, and that so far as possible no tubercular animal would find a place in any colony herd.

Having taken this stand, the members decided to find out whether any of the cattle then on the project were infected. Veterinarians from the university were called on to conduct the investigation and when the testing was through it was found that a surprisingly large percentage of the cows reacted.

Here was a rather unfortunate situation. The members of the colony had declared war on tuberculosis, little thinking that their cows were reactors. Many of the owners could ill afford to sacrifice their purchases, even though they owned but one cow. What was to be done?

A meeting was called of the live stock association. The facts were presented and it was explained that any action taken to clean up would necessitate a sacrifice. In view of the fact that most of the settlers were operating on small capital could they afford to take a loss?

They could and they would! To a man, every cow owner came out squarely for a clean up. First the one cow men and then the few who owned more.

A fine thing? Yes. But the type of settlers in the colony was capable of something finer. One member took the floor and declared that inasmuch as the colony believed in cooperative effort, and that it was known to all that few of them could stand to lose, and that a complete clean up was going to hit some of the members owning more than one reactor pretty hard, he would propose that the clean up be made a community effort and the losses occurring to the men owning more than one cow be prorated among all! And that is just how the situation was handled. A complete clean up was made, the various members stood the losses, and a new start was made.

That is the story back of the purchase of 21 tuberculin tested high grade Holstein cows and heifers at the auction held by the Napa State Hospital Saturday, May 3.

The Cultivator does not recall a finer example of cooperation than the above incident and we venture to predict that a body of men who are willing to work together with such community effort are capable of accomplishing great things and unless we greatly miss our guess that spirit will make eventually the Durham colony one of the most famous live stock centers in the West.

MEAT PRODUCTION IN 1918

Some interesting facts regarding meat production and consumption have been disclosed in a recent report of the bureau of animal industry. According to the report American dressed meat production, including lard, for 1918 amounted to 20,129,800,000 pounds as compared to the 1917 production of 16,137,300,000 pounds.

In 1918 more than 3,000,000,000 pounds of meat and lard were exported. In 1917 the United States consumed 14,500,000,000 pounds of meat and lard and in 1918 the home consumption amounted to 17,250,000,000 pounds.

The total number of cattle slaughtered last year is estimated at 15,750,400 as compared to 13,723,900 in 1917. In 1918, 69,854,700 hogs were marketed as against 57,483,000 in 1917. The average weight per head in 1918 was 9½ pounds more than the preceding year.

TO PROMOTE POLANDS

Wednesday evening, April 9, at the Travelers Hotel, Sacramento, the Poland-China breeders met to discuss and devise plans for the promotion of the breed the coming year.

Various plans were proposed, including public sales and the securing of funds for breed advertising.

The state was divided into several districts and President Bernstein appointed a breeder in each to solicit funds for this work. This committee will consist of Nate Hauk of Humboldt County, R. J. Yates, Glenn County, Mr. Beckman, San Joaquin, Hale I. Marsh, Stanislaus County, Fred Gatewood, Fresno County, Fred Hartsook, Los Angeles County, and Mr. Bernstein for Kings.

That sufficient interest in this fund might be secured, Hartsook headed the list with a subscription of $500. It was believed that a fund of at least $1500 could be raised and used to advertise Poland-Chinas as a breed.

Chester Whites with all the Comforts of Home

The efficient hog plant where C. B. Cunningham of Mills produces superior Chester White hogs. Note the splendid drainage and ample shade provisions. Redwood Tank Outlasts 4 Towers

Prior to American occupation in California (1846) a ranchman near Cayucos erected a Redwood Tank on a tower of other wood. Since that time he and his son, who succeeded him, have put four towers under this same tank, replacing towers that had decayed.

Four years ago the owner built a redwood tower under this famous old veteran tank and both are now good for many years to come.

He also installed a Remco Redwood Silo.

There are hundreds and thousands of Redwood Tanks in California that are from 30 to 40 years old.

What Kills My Hens?

By Jean A. Koethen

TWO letters which have come to me recently, and which are typical of a great many more, seem to demand a more detailed answer than is to be given in the query column. They relate to the mysterious deaths which so often occur in the poultry yard. A hen is seen to be ailing, droops a little, won't eat, probably has some diarrhoea, next day she is gone. What has taken her off so suddenly?

These cases may be grouped in three classes: The first contains those in which death is caused by cholera or some equally virulent contagious disease. These are very rare. I have never seen a case of cholera myself nor heard of one out of the books. Cholera has been known in California, but it is rare in all sections of America and may be dismissed as an explanation of death until every other hypothesis has been exhausted. Just one point as to symptoms of cholera. There is diarrhoea, as in practically all cases of indigestion, but the characteristic of the disease seems to be a yellow coloration of the excrement. Salmon says: "The earliest indication of the disease is a yellow coloration of the urates, or that part of the excrement which is secreted by the kidneys. This in health is a pure white, though it is frequently tinged with yellow as a result of other disorders than cholera. While therefore this yellowish coloration is not an absolutely certain proof of cholera, it is a valuable indication." Fowl cholera cannot be recognized with certainty except by a bacteriological examination, but the occurrence of a number of sudden deaths in a flock indicates the presence of an infectious disease. If the deaths cannot be explained in any other way a letter to Prof. J. E. Dougherty, University Farm, Davis, the Poultry Experiment Station, describing the symptoms fully may lead to a bacteriological examination, for cholera is so infectious and so deadly that it cannot be fought privately. When it is proved to exist every diseased bird must be promptly killed for there is no cure.

In the second class we may group those cases in which the eating of something unusual, and presumably poisonous, has deranged the digestion. Hens on range often have access to food of which their owners know nothing—it may be a dead chicken thrown out of some farm yard, a gopher or squirrel that has dropped dead from the effects of poison. Occasionally hens are poisoned by the arsenical sprays used for killing insects or the nitrate of soda used as fertilizer. When chickens die very suddenly their range should be investigated to make sure nothing of this sort is responsible.

The third class is by far the largest of the three—in fact it includes probably 90 per cent of these cases of sudden death. These are the cases in which death is not really sudden at all. The disease has been creeping on, unnoticed for a long time, and is not noticed till too late, or, it may be a long course of improper feeding has finally taxed the digestive organs to their limit, and there is a sudden collapse, violent diarrheoa and death. A good many poultrymen, I find, have a feeling that the constant use of barley, as we have had to use it the past two years, has not been good for the hens, especially when the barley is fed with all the hull. This rough fibre in the shape of barley hull is hard on the digestive organs at all times. If its use is continued too long, or barley is fed to the exclusion of other grain, a complete collapse of the digestion is not surprising.

The two letters I am going to quote relate to cases of this class. The first is from a Poway subscriber:

"I have a nice bunch of laying hens but they have been dying. I have lost four of my best hens and the fifth is sick. Their combs turn purple, and their bowels run, some greenish and some white. They die in two days."

In this letter we are told nothing about the ration the hens have had, except that they are on range, and so can only guess that they have had an unbalanced ration, very likely without any animal food except the little they pick up and most likely a good deal of barley.

The second letter is more explicit: "I am writing you hoping to get some relief from poultry troubles. Last year I lost 75 young chickens from roasters down to quail size, and 24 hens, after using all the remedies friends and neighbors suggested. All the young chickens died and all but one of the hens. We moved the chicken yard to other quarters and all seemed well for the nine new hens we bought. Now one hen is ill and I fear one chicken. They get droopy and have somewhat of a diarrhoea—droppings green with white mixture, do not eat but do not live long enough to get thin. I feed ground barley, wheat and wild millet(?), a sort of bird seed; they have access to barn and the best of green feed."

It is just possible, from the circumstance that the disease has appeared two years in succession, that it is infectious, but I would much sooner lay it to the barley, which, being ground, doubtless contains every bit of the hull, than to infection. It is also possible that lice or mites had something to do with the death of the 75 young chickens last year. Droopiness is the first indication that chicks are suffering from attacks of mites at night, and while mites do not cause diarrhoea they easily aggravate a case of mild diarrhoea into a fatal malady. I should give my coops this year immediate and persistent attention. Hose them out once a week with the garden hose and paint with crude carbolic acid diluted with kerosene or distillate in the proportion of one to four. Dust the chicks all over with Devil's Dust or some other good louse powder, and make sure that, whatever does ail them, they are not hampered by these terrible pests.

That wild millet in the ration is something new to me. How does it differ, I wonder, from the cultivated millet? According to Professor Jaffa, millet seeds contain 30.2 per cent crude protein, 19.63 per cent of it digestible. This is nearly as rich as linseed meal, and far too rich to use indiscriminately. All the vegetable protein feeds, linseed, flaxseed, soy bean and the various nut meals cause diarrheoa if used too freely. It is quite possible that this unbalanced vegetable protein is making havoc in your flock.

What the hens in both these flocks need, if they are to produce eggs and at the same time maintain their health, is a balanced ration, that is, a ration which provides all the materials necessary for both eggs and bodily maintenance. Such a ration must contain bran. It should contain corn meal and one other mill feed, and, unless the hens have milk, animal protein in the shape of beef scrap or fish meal. A simple mash consisting of equal parts by weight of bran, corn meal, ground barley and beef scrap, with green feed at noon and wheat at night should keep the hens laying and in good condition. If a more complicated mash is desired, try this, which was recently given me by one of our leading breeders. The proportions are arranged for a ton of the mixture: Bran, 600 pounds; corn meal, alfalfa meal and soy bean meal, 100 pounds each; ground oats, 350 pounds; ground barley, 350 pounds; meatine, 100 pounds; ground bone, 100 pounds; charcoal, 50 pounds; salt, 10 pounds.

It would be a good plan to give the hens a dose of Epsom salts all around, one-half teaspoon to each bird, mixed in a small quantity of the mash moistened with water or milk. And cut out the millet for the present at least until you are sure it has not been responsible for the illness in the flock.

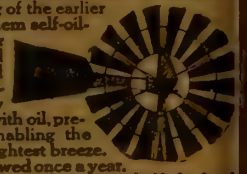
The California State Fair which will be held at Sacramento August 30 to September 9 is sending out its first special premium list for exhibits. This first list is for poultry, pigeons and pet stock.

Provison for keeping young chicks warm is always required. It may not be needed on the hottest days or during the heat of any bright day, but the chicks should always have heat available if they want it.

THE easiest and quickest way to repair leaks in radiators, pumps, water jackets, gaskets, hose connections, etc., is with Johnson's Radiator Cement. It will seal leaks immediately without laying up the car. No mechanical experience required—all you have to do is remove the cap and pour the Cement into the Radiator.

JOHNSON'S RADIATOR CEMENT

Johnson's Radiator Cement contains nothing which can clog or coat the cooling system and is absolutely harmless in every respect. It blends perfectly with the water until it reaches the leaks. Just as soon as it comes in contact with the air it forms a hard, tough, pressure-resisting substance which is insoluble in water and consequently makes a permanent seal.



Use Johnson's Radiator Cement for automobile and tractor radiators, and for sealing leaks and cracks in boilers and water jackets of all kinds.

A half-pint of Johnson's Radiator Cement is ordinarily enough for a Ford or other small radiator. For sale by hardware and accessory dealers, and garages. Write for our booklet on "Keeping Cars Young"—it's free.

THE SELF-OILING WINDMILL

has become so popular in its first four years that thousands have been called for to replace, on their old towers, other makes of mills, and to replace, at small cost, the gearing of the earlier Aermotors, making them self-oiling. Its enclosed motor keeps in the oil and keeps out dust and rain. The Splash Oiling System constantly floods every bearing with oil, preventing wear and enabling the mill to pump in the lightest breeze. The oil supply is renewed once a year. Double Gears are used, each carrying half the load

FOR SICK CHICKENS

Preventative and curative of colds, roup, canker, swelled head, sore head, chicken pox, limber neck, sour crop, cholera, bowel trouble, etc. Mrs. T. A. Morley of Galion, Mich. says: "Have used Germozone 17 yrs. for chickens and could not get along without it." Geo. F. Vickermap, Rockdale N. Y., says: "Have used Germozone 12 years; the best for bowel troubles I ever found." Frank Sloka, Chicago, Ill. writes: "I have lost but 1 pigeon and no chickens in the 3 yrs I have been using Germozone." C. O. Petrain, Moline, Ill. "I never had a sick chick all last season." Bernard Horning, Kirksville, Mo., says: "Cured my puniest chicks this spring." Ralph Wurst, Erie, Pa., says: "Not a case of white diarrhoea in 3 yrs. I raise over a thousand a year." Good also for rabbits, birds, pet stock.

GERMOZONE is sold generally at drug and seed stores. Don't risk a substitute. We mail from Omaha postpaid in new 25c, 75c and $1.50 sizes. Poultry books free.

Eggs Infertile

We bought the third prize exhibit of White Wyandotte chickens at a recent air, four hens and a rooster. We have et repeatedly settings of the eggs and ound that not an egg has been fertile. Took the male bird away for two veeks but have had no better luck. ts we bought them to breed we do not eel very encouraged with the result. Ve have never had that happen to us efore; have about 100 chicks from ur own hens doing fine. I would ap- reciate some advice as to what to do nd how.—Subscriber, Los Angeles.

The strain attendant upon exhibi- ion often results in lowered fertility, pecially in the early winter, but if his were the only reason for the un- sual infertility of your pen it would ot last until April. Your male may e too old, and your hens may be oo fat, and it may be both causes re operating. A male three years ld is of doubtful value as a breeder, nd fat hens rarely lay many fertile ggs. If the fault is in the hens, you an reduce them by cutting down the arbonaceous part of their ration corn, milo and barley) and feeding ess hard grain, with wheat instead f the more fattening grains, and nore green feed and oats, especially prouted oats and rolled oats. If the ault is in the male, it would be wise o take the matter up with the man who sold him to you.—J. A. K.

Foreign Matter in Eggs

Some of the eggs we get from our hickens are full of blood, even the hite part, and sometimes we find ieces of grain in the eggs.—Subscri- Acton.

I doubt if anyone knows how it is hat foreign substances like bits of rain, and sometimes even live worms, nd their way into the egg, but such ecurrences are comparatively rare nd therefore unimportant. The blood pots are much more important, for hey are due to a slight hemorrhage n the oviduct caused by the breaking f a blood vessel, and this in its turn s caused by too great activity of the eproductive organs. Probably your gg ration is a trifle too forcing. If ou will make the mash half plain ran and give your hens all the green hey will eat, thereby increasing the ulk of the ration, I think you will nd the blood spots disappearing. his condition is generally noticed in he spring in pullets that are laying eavily. If it continues after the ation has been modified it would be ell to find out just what hens are aying the blood spotted eggs and and them so that they will not be sed as breeders.—J. A. K.

R. I. Red Questions

In March I bought a dozen chicks, R. I. Reds, from trap-nested, heavy aying stock, also bought eggs and atched 15 chicks. The chickens I aised last year have certainly laid ell and are a fine color, purchased he eggs from the same place as this ear. I want to save a good cock- rel, and some of the finest pullets for reeding purposes. Shall I select the nale or the pullets from the chicks I ought? Is it the male that trans- nits the heavy laying qualities? The hicks I purchased seem to be off olor, but those I hatched are a good lark color. Would you advise capon- ing the males I expect to keep for able use and how much does it cost o have such work done? What is he cause of chickens eating feathers? Have had trouble in that respect for wo years. Subscriber, Long Beach.

Mate the male from the chicks you ought this year to the best of last ear's pullets. It is the male that ransmits high productivity, and your ullets next year should be better layers than their mothers if your cock- erel's pedigree is right. Always make sure that your breeding male is the son of a high producer if you wish to build up a heavy laying strain. Opin- ions differ about caponizing. If you wish to keep your cockerels ten or twelve months it might be worth while to caponize them. If you use them as soft roasters you will not gain much by caponizing. The operation, I believe, costs around ten cents per bird. A teaspoon of aloes mixed in a cup of lard is recommended as an ointment to use on the feathers of birds that are victims of the feather pulling vice. This vice is sometimes attributed to idleness and sometimes to a lack of something—animal food, perhaps—in the ration. See that your birds have a well balanced mash, and that they are kept busy scratching for their grain.—J. A. K.

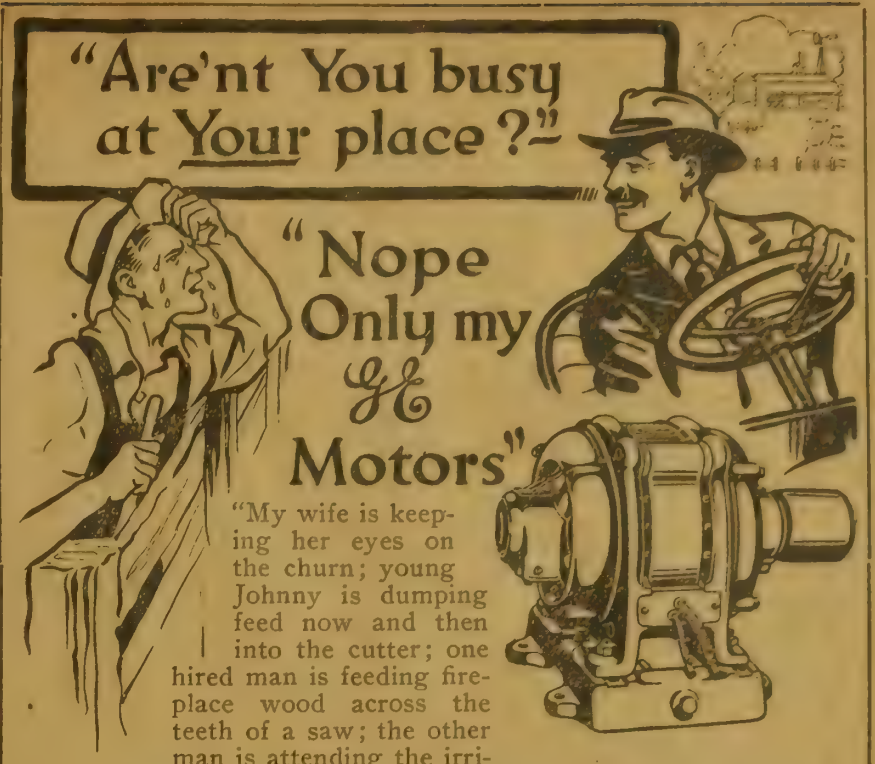
FINE PRODUCERS

We have a fine flock of Plymouth Rock chickens, one of which stole her nest away and during the week be- tween Christmas and New Years came walking out with 19 fine chicks (with two more fertile eggs in the nest). As she is rather a small hen she could not cover so many and two chilled and died the first night and another was stepped on by a clumsy gardener. However, with the aid of a good natur- ed sister Biddy 16 were successfully raised, seven cockerels and nine pul- lets. They are a beautiful little flock, being well developed and very uniform as to size and color.

Now for what seems to us the re- markable part: Four of the pullets began laying May 1. Isn't it rather unusual for pullets to begin laying at four months?

We have another hen that lays huge double yolk eggs. The one laid yes- terday measured 6¾ by 8 inches in circumference.—E. P. Judd, Monte- cito.

Unless the premises where chicks are kept and all appliances used are known to be absolutely free from lice and mites, and it is certain that chicks have never been exposed to them, it is a wise precaution to paint or spray the brooder with a mixture of four parts crude petroleum and one part kerosene, allowing it to dry thorough- ly before using. Puffs of insect powder on the chicks when in the brooder, about once a week, will destroy any lice than may be on them.



Skim milk, either sweet or sour, and buttermilk are especially valua- ble feeds in hot weather, making the diet lighter without reducing its nu- tritive value. The milk should be giv- en as a drink in vessels, from which chicks can take it without soiling one another with it. The use of milk does not do away with the use of water, which should be given as usual.

TIME TO GET UP

A new bunch of colored recruits ar- rived at camp late one night. They were startled from their sound slum- ber by the sonorous and insistent notes of the bugler blowing reveille. None of them paid any attention to it except one darky, who sat up and shouted: "You'all bettah get up! Dat an't yoh mothah callin' you up, boys; dat's yoh uncle talkin' to yoh now."

A NEED

I said in my heart, "I am sick of four
walls and a ceiling.
I have need of the sky.
I have business with the grass,
I will up and get me away,
Where the hawk is wheeling
Lone and high,
And the slow clouds go by."
—Richard Hovey.

"My wife is keeping her eyes on the churn; young Johnny is dumping feed now and then into the cutter; one hired man is feeding fireplace wood across the teeth of a saw; the other man is attending the irrigation canal in the west field — but the real work in each case is being done by my

G-E Farm Motors"

Not only do electric motors save manual labor but the work is done quicker and more economically. They allow the owner more time for general supervision without halting the necessary chores.

Ask the nearest lighting company about G-E motors for all kinds of farm work.

Poultry for Profit

Read what Portland Oregonian has to say about this book and its author.

There is a woman down in California who knows more about poultry than all the men in the state, and this, too, for that matter. Her name is Jean A. Koethen, and she has written a book which is published by the California Cultivator of Los Angeles, and called "Poultry for Profit." It costs a dollar, post-paid, and it ought to be in the hands of every one who is keeping hens. This paper has reprinted a lot of matter written by Mrs. Koethen and, because of its quality, her book is recommended. Climatic conditions in these states are so nearly alike that what is good or bad for fowls there is the same here. The price of three dozen eggs will get the volume and its purchase is a good investment.—Portland Oregonian.

Send in $1.00 for book or $1.75 for book and California Cultivator.

HOGS

BIG TYPE POLANDS
W. H. BROWNING, WOODLAND, CAL.

HOGS

NICK GENTRY
Dean of the Berkshire Breeders, breeder of Baron Duke 201st, Grand National Champion, says: "I never saw a better width of loin than he has. If more breeders would produce the type of Baron Duke 201st there would be many more Berkshires raised and sold. Every animal on both sides in pedigree of Baron Duke 201st for many generations back were good ones; every one of them. His great size, good heart girth, very smooth shoulder, back and loin, legs and feet are hard to equal in one animal. If he is not a good one and a well bred one there is no other. I am glad to give you my opinion of Baron Duke 201st." N. H. GENTRY.
You can buy his three months' old weanling pigs from 650-pound prolific sows for $35.00. They are going fast. Order now.
SANDERCOCK LAND CO.
In charge of Natomas Land Sales.,
23 Montgomery Street,
San Francisco, California.

CASTLEVIEW
Giant Type Berkshires.
We are booking orders for spring pigs from Grand Champion sows and sired by Mayfield Rockwood, sire of Champion barrow at 1919 Western Berkshire Congress.

FARM LANDS FOR SALE

SAN FERNANDO VALLEY
Los Angeles Co., Cal.

Sixty acres right on the boulevard and electric line, garden soil, city water, close to stores and school; considered the best alfalfa land in the valley. Priced for quick sale at $450 per acre; small cash payment; easy terms on balance.

Forty acres on boulevard. Citrus land, fine garden soil, beautiful view, aqueduct water, $450 per acre. Easy terms.

Eighty acres on boulevard adjoins lemon grove and very fine alfalfa or truck land, nothing better in Southern California at $450 an acre; small cash payment; balance long time.

Twenty acres gravelly, sandy loam, excellent for truck farming, near stores, school, etc. Close to two boulevards, city water, nothing better at $350 an acre, with long time to pay.

Forty acres. Just the finest land out of doors, water on two sides, cash rent of $25 an acre goes with the land if bought soon; $350 per acre, reasonable cash payment, balance easy.

Thirteen acres in crop. Close to stores and fine schools, garden soil, city water. A snap at $250 per acre.

Seventy-five acres of excellent soil with city water, near fine school and town; just the thing for beans or potatoes, about $100 underpriced at $300 per acre.

Twenty acres of the choicest land in the valley, close to transportation and car line with city water. An excellent buy at $350 per acre.

Ten acres on boulevard, garden soil, city water, close to two good towns, schools, post office and the cream of the valley at $550 per acre, easy terms.

Twenty-five acres just off of boulevard near town, adjoining property well improved, fine soil, city water, only $300 per acre. Terms.

Twenty acres, heavy chocolate soil, close to two fine boulevards and near good town, city water. Priced for quick sale at $500 an acre; easy terms.

All of the above lands are from 10 to 25 miles from the center of the city of Los Angeles, and I would not offer it for sale if it was not good stuff and a bargain. I admit I sell for less.
